I have been reviewing this project description and I note that two of the historic buildings are not listed as being on the project. In the email below, I mention the blacksmith shop and the corn feeder. Also, the historic significance is not mentioned, the history starts with the purchase of the property by the Kaisers. Since this is such a historically significant property in our neighborhood, I would like to see all the building mentioned, and a discussion as to which ones are going to be torn down along with the history of this site.

Also, I have a phone number of Yolando Solano, but not her email address. Would you please forward this to her? and also add it to the packet for the Dec 2nd Landmarks Commission meeting?

Thank you Traci

Subject: Re: UPE14-0008 Ramey Winery and Tasting room

Hi Traci

Thank you for taking the time to send me an email explaining the process, I appreciate it. The parcel may not be zoned HD but it probably has the oldest buildings on this site than any other on Westside Road. There is a rich history and hopefully is well documented at our local Healdsburg museum and at the Northwest Information Center.

This is going to be a tough project for me because I worked at Westside Farms for many years and am personal friends with the former owners. It is a mixed blessing. I know the Rameys' have plans to re-purpose the Hop and Baling barns, which is going to keep them from falling down. The former owners did not have the financial ability to do that, so, for that I am personally grateful.

The Ramey's told the Kaisers that the original farmhouse was NOT going to be torn down, but I see that has changed. The farmhouse was build in the 1800's. Also, the old blacksmith shop (which I worked in for two seasons) will be torn down, along with the corn feeder? (not sure that the name is correct) will also be torn down. The barn building that they want to convert into another dwelling is so old it is put together without nails and has hand crafted beams cut with an ax. I do not think there are other examples of this on Westside Road.

Our historical buildings on Westside Road are such a big part of our rural character, we as a community would like to see them remain as part of our farming heritage. I have spoken to Yolanda, and we (Westside Community Association) hope to apply for a grant thru the Landmarks Commission to do a Historic Resources Inventory of Westside Road. We will be applying for a grant this year.

Beyond the historical significance, I appreciate your letter to the applicant regarding the project. It is valuable to note the seven specific concerns early on as this permit process must be an expensive undertaking for the applicant.

We look forward to seeing the Historical Evaluation. Thanks again for taking the time to email me.

Best

Nancy

Hi Nancy,

You reviewed the above file and left a note that Landmarks Commission was not marked for referrals. The project has been deemed incomplete so no referrals have been sent out at this time. But, I wanted to provide some clarification on processing procedures. The project site is **not** zoned HD (Historical Resource), but I have required an Historical Evaluation and Cultural Resource Survey. Once the Historical evaluation is submitted it is reviewed by PRMD's Planner who sits on the Landmarks Commission to determine if the project must be set for Landmarks Commission review. PRMD has always taken a conservative approach in this determination. But I will know more once the Historical Evaluation has been submitted. Also, once referrals are able to be sent out, the response from the Northwest Information Center at Sonoma State will also provide further information.

If you have any further questions, please contact me and Yolanda Solano is the PRMD Planner for Landmarks Commission if you have any processing questions.

Sincerely,

Traci Tesconi

RE: Concern – Potential Breach of Williamson Act Contract – UPE14-0008

Dear Planning Director Wick,

The Westside Association to Save Agriculture (WASA) is responding to the Referral to Agencies for the Initial Study of the subject project. And, are requesting that your department review the information outlined below (documents attached), and respond as to whether the project description included in the Initial Study constitutes a "material breach" of the Williamson Act contract.

Department of Conservation – Definition of Material Breach: " Government Code Section 512250(b) defines a material breach on land subject to a Williamson Act contract as a commercial, industrial or residential building (s), exceeding 2,500 square feet that is not permissible under the Williamson Act, contract, local uniform rules or ordinances. "

Project: Ramey Vineyards LLC 7097 Westside Road Healdsburg, CA 95448
APN: 110-240-031 -032 -040
Ag Preserve 397-07-037936 Type 1 Prime – with 50% planted in vineyard

Sonoma County Williamson Act Considerations: The project site is under a Williamson Act Contract for prime land (Type 1), which provides a tax break to the owner for land restricted to agricultural and open space uses, as outlined in the County Uniform Rules for Agricultural Preserves. In order to comply with the contract, land must meet the following standards:

1) The land must be devoted to an agricultural or open space use as defined in the Williamson Act; the County has required at least 50% of the land be devoted to agriculture or open space use to meet this standard;

2) The land must have a minimum parcel size of 10 acres for a type 1 or 40 acres; and

3) **Compatible uses may be permitted provided that they are incidental to the primary use of the land for agriculture and they meet the criteria for compatibility.**

Permit Application History:

A. **January 21, 2014 Original Application Proposal Statement:** Baling Barn building defined as primarily event/ entertaining space: "…refurbish three story baling barn as a marketing reception area: equipment storage on the ground level, kitchen and meeting area for marketing purposes on mid-level; and 2 bedrooms as marketing accommodations on the top level, and two work stations."

B. **February 4, 2014 Letter from PRMD Staff to Applicant: Page 2 -3, Item 4 addresses Williamson Act Consistency relative to dedicated "marketing center":** County questions the separate Baling Barn structure given uses include a commercial kitchen, private dining and tasting space, 2 bedrooms and baths and 2 work spaces – primarily event-related activities.

The planner cites Category G, attaches policy for dwelling units, and then concludes the Proposal does not comply: "Category G: Miscellaneous: Special events, when directly related to ag…promotion; provided that: a) events last no longer than two consecutive days and **do not provide overnight accommodations; b) No permanent structure dedicated to events is constructed or maintained on the contracted land."**

Finding: " For the project site, **neither the density, nor the Williamson Act contract allows another dwelling unit on the parcel.** Therefore, the marketing accommodations as designed are inconsistent with the zoning density allowance and the Williamson Act contract. Appropriate revisions to the project and plans are required prior to further processing the request."

C. **September 17, 2014 Meeting Re-cap between Ramey owners, Traci Tesconi, PRMD, Adobe Associates and Earthtone Construction: Paragraphs 3 -4:** The Applicant is proposing three to four separate tasting areas on the Williamson Act lands: (1-2) public in Hop Kiln(s), (3) private Club Member only Baling Barn with commercial kitchen, large event room, 2 bedrooms with bath and work spaces or lounge; and (4) winery location across the road for distributor and high end club member tastings.

The County generally only allows one tasting room, yet the PRMD planner advised the Applicant to label the building: **Parcel 110-240-031-032:** "Discussion about uses of Baling Barn as tasting – Tesconi recommends labeling it as …"private tasting by invitation only…" This would separate it from the public tasting room which will be located in the current Hop Kiln."

D. October 7, 2014 PRMD sends out the referral packet for UPE 14-0008: Ramey Vineyards LLC that describes the project as follows. **A significant deficiency in the application is the lack of clear square footages for its event and entertaining space.**

Conservatively, the Baling Barn has about 2,800 square feet of event-related and "dwelling" space on two stories, including a kitchen, dining area, several lounges, and 2 to 4 bedrooms with 2 baths. The Hop Kilns add between 2,500 – 5,000 square feet of

public tasting and food service facilities, depending on whether just one or both will have tasting. And, all the buildings are joined by outdoor entertaining space.

See Figure A1.01 which labels certain spaces as "retail" or "restaurant" or "lounge" for Hop Kilns and Baling Barn – one item missing from the description is the player piano and the chandeliers:

- **68+ acre parcel: 2 Hop Kilns** *(approximately 2,000 to 2,500 sq feet each)* **converted to public and private tasting:** (Tasting Rm 795 sq. ft.; Tasting Bar / Kitchen 397 sq. feet) and Case Storage 813 sq. feet)
- **2 story Baling Barn** (*approximately 1,500 sq. ft. per floor* **with two floors converted to a "Private Club and Lounge"** (second floor: Private tasting room 595 sq. feet, Retail bar and Kitchen 295 sq. feet, Private Club 545 square feet. Third Floor" 2 Bedrooms with bath, 2 " Work Spaces or Lounges
- **22 Promotional Events of up to 300 people,** with 10 in the Baling Barn including "on-site food preparation" with dinners lasting until 9 pm.
- 6+ acre parcel: 23,000 square feet of Winery Production facilities, with private tastings and some events, and Wine cave for storage.

From the above, and as further documented in the attachments, it does not appear that the Applicant changed the project to address the Williamson Act concerns about another "dwelling unit" – as the kitchens and bedrooms remain - nor the concern that the Baling Barn building is dedicated to Events and Entertaining.

The Westside Association to Save Agriculture thanks you in advance for your review and assessment of this situation. The Applicant is early in the process, and this is the time for adjustments to be made to the project.

Sincerely,

Westside Association to Save Agriculture

Westside Community Association

Formed for the purpose of furthering the welfare of the Mill Creek and Westside Communities

December 2, 2014

Sonoma County Joint Design Review/Landmarks Commission
2550 Ventura Ave.
Santa Rosa, CA 95403

RE: 7097 Westside Road, UPE14-0008

Dear Commissioners

This letter is on behalf of the Westside Community Association (WCA) regarding the proposed use of the existing hop kiln structures for entertainment and visitor serving uses, which is included the Ramey Use Permit application.

The WCA does not believe that constructing a tasting room and other visitor serving facilities in the location of the current hop kiln structures complies with either Sonoma County zoning ordinances, the General Plan Scenic Resource Element or Section 65567 of the State Planning and Zoning law.

Section 65567 of the State Planning and Zoning law prohibits issuance of a building permit in contravention of the General Plan's Open Space Element. The proposed new tasting room, entertainment and parking facilities intrude into the 200 foot setback and may not be built consistent with either State law or the General Plan requirements.

The existing hop kiln structures are non-conforming structures because they are located within the 200 ft. scenic corridor setback. The provision of Section 26-64-030 Scenic Resource Combining District apply to properties along scenic corridor, and delineates the conditions whereby construction may be permitted on the properties covered by this provision The proposed project is located in a scenic corridor and thus subject to the provision of this section. Since the proposed project is a not a maintenance, restoration or reconstruction of the existing hop kiln, but rather a new use, requiring virtually all new construction, there is no provision that would permit such new construction and new use within the 200 foot setback.

The provision of Section 26-64-030 allowing construction new barns and similar agricultural support services would also not apply as agricultural support services are spelled out in Policy AR-5f as processing, storage, bottling, canning, and packaging. The proposed use is clearly visitor serving.

Similarly Article 94 – Nonconforming Uses of the Sonoma County Zoning Code delineates the circumstances under which a non-conforming use may be continued or reconstruction may be permitted. Again, the proposed new use and construction does not comply with County codes. Under section 26-94-010 the non-conforming use may be replaced by a use of the same or less intensity upon obtaining a use permit. The proposed project does not qualify under this provision for two reasons. First, the use of the hop kiln structure has been abandoned for a sufficiently long time that any new use would not be replacing a current use. Second, the proposed use is not "the same or less intensity". A tasting room, VIP lounge, marketing accommodations, and two kitchens and dining areas is certainly not a less intensive use.

Section 26-94-020 delineates how a non-conforming use can be reconstructed. Under this provision, the need for reconstruction would have to be as the result of several enumerated circumstances – explosions, acts of god and the like, and presumably be replacement of an existing, non-commercial use. The proposed project does not meet these standard for a reconstruction.

Finally, even if the proposed new construction and use were a continuation of an existing non-conforming use, which is not the case, the proposed modifications, in addition to being a more intense use, would increase the foot print of the structures by more than 10% limitation contained in Section 26-94-010. Based on drawing A1.10 of the application the existing hop kiln structures would be increased by approximately 19%.

Therefore, for the above stated reasons, the WCA requests that the Landmarks Commission not recommend approval of this new construction because is does not comply with the County's General Open Space Element and the County's Zoning Ordinances.

Thank you for your consideration of the important matter.

Sincerely,

Westside Community Association Advisory Board

Santa Rosa, CA 95403

re: File 14-0008, 7097 Westside Road

Dear Director Wick,

This letter is in support of Ramey vineyards and winery for their proposal at Westside Farms.

I have known Mr. Ramey and his staff personally as a next-door neighbor on Haydon Street in Healdsburg. He and the winery staff have been good neighbors for a decade. I have always been impressed with the winery operations' professionalism and courtesy, and their willingness to help and share.

The proposal put forth by Mr. Ramey for use and re-outfitting of the Westside Farms operation is, to me, a welcome change in wine country. Ramey is a local wine with local grapes; at 60,000 cases the winery is not large; and the winery is based on high quality wine. Their proposal for Westside Farms is consistent with the business I know.

With four large events, no weddings and no 'barrel tasting' days, the project would be lower impact than many. Restoring the hop kilns would serve an historic purpose. Maintaining the land in agriculture, which is already vineyards, appears rational. The project is not extravagant in scope, nor a 'local' branding for a remote business. The Rameys are long-time local winemakers.

Like other neighbors, I share concern over the proliferation of wineries and the 'vineyard economy' of Sonoma county overriding other ways of life. I am concerned about the cumulative impact from many projects, which all generate tourism on the same days of the year, creating near-chaos on local roads and towns. I agree that wine can be made in town, but it has impact there as well - we sometimes work next to a bottling line!

I support this project because, to control cumulative impacts, one must have good projects and honest players. The restoration of the hop barns by a local family, the continuation of farming at Westside farms by people I know as good neighbors, and their production of excellent Sonoma County wine, create a winery project I honestly support.

Please call me if you have any questions.

Sincerely,

Fred Euphrat

RECEIVED
SEP 17 2014
PERMIT AND RESOURCE
MANAGEMENT DEPARTMENT
COUNTY OF SONOMA

Judith,

I feel confident we will be able to reassure your members with the results of our studies when we file our use permit. However the process of convincing our neighbors that we are leaving our business to our socially aware and responsible children and that we don't have any interest in the restaurant business, seems daunting. A commercial kitchen is just a place to cook real food rather than microwave items for reheating. Catering kitchens mean paying outside help to cook and drive the food to us. All of us have the equivalent of a commercial kitchen in our homes but most of us don't entertain the idea of offering our services to outsiders. You referred to "large dining spaces" but when you consider the amount of space needed for glassware in order to show a wine writer or distributer group a selection of our wines (six Chardonnays, four Cabernets and three Syrahs) you might be surprised at the amount of table space required.

It is apparent that some wineries have exceeded the limitations of their permits and created less than agreeable conditions for their neighbors. Being wary of new development is perfectly understandable. At the same time I believe we happen to agree on a fair bit: protecting the environment, preserving agriculture, refraining from excessive events (especially after hours), and limiting noise.

Sincerely,

Carla

To: Carla Ramey
Cc: Judith Olney; Nancy Citro
Subject: Re: Westside Area InfoZone

Carla -

I'm responding as the editor of the InfoZone and not in the official capacity of the WCA Advisory Committee. However, I'm hoping that some clarifications on the process will be helpful in further discussions. The reality is we can only evaluate the specifics of an application based on its cumulative impact on our scenic corridor, rural character and road safety concerns. And, our challenge is that Westside Road already has over 20 permitted wineries, so the current baseline traffic levels from all existing winery uses and permitted events are significantly higher than the happy weekends of the pumpkin patch.

Please let us know when when your revised proposal is submitted to the County, and the Advisory Committee will review so we can update the information on the website. In line with the County's comments, are concerns are with the Marketing Center - commercial kitchens and large dining spaces raise legitimate concerns about Ag facilities morphing into commercial restaurants. And, we remain concerned about road safety and noise associated with any events that extend past tasting room hours. Given the County's Use Permits run with the land, we have to be mindful that the property can be sold to owners who are not connected to the welfare of our community.

We want to ensure you that our comments are focused on the project itself, and are not intended in any way to be personal toward you and your family. We welcome you and your family as neighbors who care about the land, are pleased you are retaining your ranch-manager with sustainable farming practices, and applaud you for the work you've done to improve the riparian corridor.

Judith

Subject: In support of the Ramey Wine Cellars project on Westside Road

Good morning,

Thank you for taking the time to read my email in support of the Ramey Wine Cellars proposed winery on Westside Road.

The Ramey's are already careful stewards of this land and will continue to be.

Aside from the tax revenue, this project will also bring jobs to the community. The fact that many of Ramey's team members have been with them for 10 years or more says a lot about the kind of employers they are. They care about the people that work for them, pay a generous wage, give opportunities for growth and offer fair benefits packages.

The plans they are proposing will fit within the scope of their neighboring wineries, and they will share mutual guests. Thus, a large amount of additional traffic will not be created.

I hope that you will carefully consider this proposal and vote in favor of Ramey Wine Cellars.

They make outstanding wines and they are outstanding people. Westside Road will be lucky to have them.

Kindest regards,
Monica Smith

Subject: In Support of David Ramey

Dear Tennis and Traci,

I am writing to voice our support of David and Carla Ramey and their winery project on Westside Road.

I can think of no better stewards for such a project as the Ramey's. Not only have they contributed immensely to Sonoma County (with their time and their money) but they also embody the spirit and work ethic of the people who work tirelessly to make the wine industry successful.

In the view of our winery, our ownership and our employees the Ramey Winery project should be approved post haste and applauded by all of us who are fortunate enough to call Sonoma County home.

I thank you for your time and attention to this.

Subject: Support of Ramey

Dear Tennis and Traci,

I am writing in support of David Ramey's proposed winery at the Westside Farms location!

It is discouraging to see that a vocal minority is shaping our counties policies toward the wine industry. This county was built on the back of agriculture, it is what makes this such a beautiful place to live and work. But increasingly, there are a number of people who want to close the door on the very industry that protects our ag land, brings tax dollars to our county, and provides countless jobs in our community! There is no doubt that there are winery (and other development) projects that do not respect our land, neighbors, and zoning......but this is not one of those projects!

Thank you for your service to our county and your time in reviewing this proposal. I hope you will approve the Ramey project based on the zoning and facts, not on the fabricated opinions of a vocal minority.

Sincerely,

Clay Mauritson

Subject: Ramey Westside Road Winery Project

Hello Tennis & Traci,

My name is Chris,and my family has been in Sonoma County since the 1970s. I graduated from Healdsburg High in 1987. My first job was working for a winery in Dry Creek Valley as a 16 year old.

I am writing you to express my support for the Ramey Family's winery project on Westside Road. The wine business has been integral in my family's love and connection with the land in Sonoma County. As we all know, it provides jobs and much needed tourism and tax revenue that keep our cities, our schools, our infrastructure and roads maintained.

I would even surmise that the wine business, and resultant scenic beauty of manicured vineyards throughout the area was a key reason why many of the very small and vocal opposition group chose to move here.

I hope that you will reject this blatant N.I.M.B.Y. action and approve the Ramey's project.

Sincerely,

Christopher O'Gorman

Dear Ms. Tesconi and Mr. Wick,

I'm writing this note to express my support for the efforts of David Ramey and his family to enhance their property on Westside Road. The Ramey's have run a very professional and county-centric business for years, and have done all of the per-requisite jumping thru hoops and studies and analyses to show that this project would be demonstrably positive to the county. On top of that, they are excellent corporate citizens and deserve our support and respect. Thank you for your consideration.

Subject: WESTSIDE ROAD FARM PROJECT!

Follow Up Flag: Follow up
Flag Status: Flagged

As a homeowner at 8455 Westside Rd for over 50 years I am saddened by the increase of NON-AGRIGULTURE related business on Westside Rd.

I have witnessed beautiful open fields turned into WINE TASTING parking lots.
Daily I see private busses bringing people out to one of the more than 30 wineries on Westside Rd.
On the weekends the traffic is so CONGESTED and DANGEROUS (thousands of cars,trucks,busses and bikes; all out there on WESTSIDE RD sampling Alcohol)
that making the drive into town, is out of the question..

WESTSIDE ROAD is beyond the saturation point with TOO MANY WINERIES.

Vineyards ARE agriculture;
WINE TASTING EVENTS are NOT!

If a wine maker can not survive just growing grapes and making wine then they should be in another business. For many years there were no events for vineyards / wine growers.
They made their product , advertised and sold their wines at stores.

WESTSIDE RD. is NOT a Retail Outlet or Liquor Store street.

This new paradigm of more, more , more is WRONG!

NO MORE WINERIES ON WESTSIDE RD.
NO MORE NEW EVENTS.
THIS HAS BECOME AND MAJOR INTERFERENCE
of our daily lives on WESTSIDE ROAD.

The time is NOW for limited events and NO NEW WINERIES !

Don deBrauwere (Kathryn deBrauwere and 98 year old June deBrauwere)

Subject: Support for David Ramey Westside Road

My wife and I have lived in Sonoma County since 1997 and have a good perspective on the people, the place and our need to treasure and protect it.

With that in mind, we write to support David Ramey and his Westside Road winery project.

It is clear that David has carefully considered the impact of this project and completed in detail a variety of studies and required steps to provide a good bit of information for consideration. That is the required and necessary part of this equation, and it speaks pretty plainly in support of his efforts.

But who David is also matters. And David Ramey and his family have been great stewards of Sonoma County's dreams and aspirations, as well as the operations he has maintained here. Under his guidance, many additional vintner families have achieved success that allows them to also invest and participate fully in our community. He is anything but reckless or uncaring, anything but thoughtful and considerate. His project will be a model for others to observe and follow.

I urge approval of this project. The noise created by a few should not be allowed to drown out complete and careful consideration of the facts, and the facts support approval and, in fact, a grateful appreciation for the Ramey's willingness to complete all that has been asked of them.

Thank you for consideration.

Dear Planning Commissioners,

We strongly object to the full-scale sell-out of the laid-back, rural, bucolic environment we used to have here in Sonoma County. We appreciate that wine tourism brings lots of money into the County coffers but there's a limit to how much you can squeeze into the landscape and still find it a good place to live. Or even to visit.

My husband and I moved here in 1986 to escape the crowds and traffic and noise and general hype of the Bay Area. Now Sonoma County is becoming just like it--losing its character to ambitious rich people who don't care about the impact their wineries have on the environment or lives of normal people. We have enough vineyard monoculture here already.

We strongly urge you to deny the permit for the absurdly gigantic, inappropriate commercial development of 7097 Westside Road. It's in violation of the County's general plan and an insult to residents and our quality of life.

Sincerely,

Jim Seward and Laura Morgan

Dear Planning Commissioners,

I am concerned that the winery project at 7097 Westside Road is too large and inappropriate for the rural character of the neighborhood and does not meet criteria of the scenic corridor in the General Plan Open Space Element. Large buildings, parking lots, lodging, large kitchens, tasting rooms on both sides of the road within a quarter mile of other much smaller wineries, is inconsistent with the intent of the General Plan to preserve the rural character of Sonoma County. This large tourist and business development would create traffic, noise and pollution and would require destruction of natural features to construct. The hospitality complex, winery distribution center, office building is more suitable for a city center than an agricultural area. The majority of citizens live in Sonoma County because they relish it's rural and natural aspects, rather than seek enrichment from commercial development. Once one large business like this is allowed a foothold, other large hospitality developments can roll into the agricultural areas and ruin its rural characteristics. Moreover, such development is incompatible with California's mandate to reduce the carbon footprint that is creating climate disruption.

Please emphasize these concerns when considering the permitting of this winery complex.

Sincerely,
Leslie Lihou

Subject: Project at 7097 Westside Road, UPE14-0008

Dear Planning Commissioners,

The scale of this project violates many of the rules that have been set in place to protect agricultural lands, the scenic and rural area of Westside Road, and much of Sonoma County. This project would serve the same people with less impact on our Westside community if relocated. There is plenty of space to relocate in Sonoma County at a town center or business center to accommodate the goal of the owners of this project. To try to take away the beauty of this area is deceitful to those who live here and to the project's anticipated consumers, guests and or customers.

To continue considering such a scale of construction in the Westside area is just wrong for all parties involved. There is no option to widen Westside Rd and that is what it would take to keep yourselves on what might be considered a self serving path. You are not serving our county or our community when you do not draw a solid line against these types of projects. To consider a huge processing plant on Westside Road is just wrong - adding commercial kitchens, guest housing - why is this continually happening?

Please listen to us - don't destroy what so many of us have worked so hard to maintain in order to sustain a healthy life style. Westside Road is a happy place NOW, and there is NO MORE ROOM for WINERIES of this SCALE and realistically of any scale.

Thank you for listening and please lets move on and stop with these types of project requests/permits for Westside Road, Healdsburg, CA.

"Keep our County's Natural Beauty"

My best regards,
Kitty

To:	Tennis Wick; Traci Tesconi
Subject:	7097 Westside Rd.-Westside Farms-Ramey's

Good afternoon Tennis and Traci,

I am writing on behalf of my support for the Ramey's to continue with their vision of the Westside Farms property.

I have known the Ramey family quite intimately for about 15 years. They are the most down to earth, Waldorfian folks I know. Westside residents should count their lucky stars that this beautiful property fell into the hands of the Ramey family and not to somebody that doesn't have a connection to or the love of Healdsburg the way David and Carla do. Somebody could have just as easily purchased this property and built a heinous, monstrosity of a home with no regard to natural scenery or wanting to preserve the Hop Kilns there.

The Ramey's have more love and respect for that property. Carla told me they used to take their kids there 25 years ago. They purchased the URL to continue Westside Farms. They will produce jams, honey, olive Oil etc., using the Westside Farms logo and name. They had the 20 year old bee hives that were in the hop kilns, professionally removed then brought back onto the property. These are not people that are going to butcher or disrespect the land.

Please consider all of this when making your decision.

Thank you very much.

Sincerely,
Linda

4th district Cameron Mauritson cameron@mauritsonfarms.com

5th district Pam Davis p.davis479@gmail.com

Wine and Water Watch is a local organization of over 250 citizens concerned with the overdevelopment of the wine tourism industry and promotes ethical land and water use. We oppose the industrialization of agricultural lands not growing food, fiber or sileage and advocate agricultural practices that are ecologically regenerative.

We are very concerned with the application for this permit which we consider over-scaled and will contribute to the myriad of problems already that exist in that area due to over concentration by the wine industry. This is one of the areas that the County of Sonoma is studying due to over concentration, we don't see how this can possibly be permitted under the circumstances. Wine & Water Watch is not against the wine industry, just bad projects that make situations for the residents untenable. It is unfair to the applicants as well to spend copious amounts of money to fund a project when the community does not want it and will oppose strenuously.

We are particularly disturbed with the morphing of the term agriculture to now include food pairings, office suites, commercial kitchens and VIP lounges. This is NOT a Williamson Act provision to allow such over building on precious agricultural lands which the General Plan protects. Is the food they want to prepare from their property? Is a VIP lounge necessary to promote agriculture? Why is there a need for 4 tasting room venues on the same property?

Westside Road has been the site of numerous driving and bicycle accidents due to the narrow, winding roads. Adding more trucks and people on this road is a huge safety concern with many "joint road use conflicts". The area is totally saturated. Losing the rural character that brings visitors to our area is self-defeating.

Neighbors must deal with traffic, pollution, noise and safety issues as is. With food pairing and commercial kitchen how many local restaurants will be by passed to accommodate corporate interests? This business model is not sustainable in any way as other communities have found.

We urge you to reject this permit in the initial stages to not only protect the community from the problems created by the industrialization of agricultural lands but stop the capitalization costs to the winery owners seeking this over scale expansion in our rural community.

Sincerely,

Wine & Water Watch Board members

Subject: Ramey Westside Road Project

To Whom It May Concern,

It seems that people's opposition to the Ramey project is without merit. This is an established winery that has proven to be a positive mark on the wine industry in our area. They have done their due diligence to meet every requirement. They want to restore a dilapidated building into something beautiful and useful, and they want to utilize their land in the purpose that it is zoned for. I am not sure I see where the problem is. Without the wine industry, we lose a great deal of what this area is about and why visitors come here. In my experience, wineries bring beauty, culture and sophistication. Why wouldn't we want to welcome them to our community?

Sincerely,
Samantha

Resolution Number

County of Sonoma
Santa Rosa, California

September 21, 2017
UPE14-0008   Traci Tesconi

RESOLUTION OF THE BOARD OF ZONING ADJUSTMENTS, COUNTY OF SONOMA, STATE OF CALIFORNIA, ADOPTING A MITIGATED NEGATIVE DECLARATION AND GRANTING A USE PERMIT APPROVAL TO RAMEY VINEYARDS, LLC FOR A NEW WINERY WITH A PUBLIC AND A RESERVE TASTING ROOM WITH TWO-GUEST ROOM MARKETING ACCOMMODATIONS ON THE UPPER FLOOR, AGRICULTURAL PROMOTIONAL EVENTS, AND INDUSTRY WIDE EVENTS LOCATED AT 7097 WESTSIDE ROAD, HEALDSURG; APN'S 110-240-031, -032, and -040.

WHEREAS, the applicant, David and Carla Ramey, on behalf of Ramey Vineyards LLC, filed a Use Permit application with Permit Sonoma to construct a new winery building (two story, approx. 32,210 square feet) with a maximum annual case production of 60,000 cases, a new wine cave (approx. 20,720 square feet), a conversion of an existing historic hop kiln building to a public tasting room open from 10 am to 5 pm, 7 days a week, and a conversion of an existing historic hop baling barn to a reserve tasting room with a two-guest room marketing accommodation unit on the upper floor. The request includes 22 agricultural promotional events per year with a range of maximum guests (10 events with 30 guests, 5 events with 60 guests, 5 events with 120 guests, & 2 events with 300 guests), and participation in industry wide events totaling two event days per year with a maximum of 300 guests on 75 acres. On the west side of the project site, agricultural promotional events would be limited to a maximum of 30 guests and industry wide events will not be held on this portion of the project site. A four- year Use Permit term is requested under Section 26-92-130 of the Zoning Code. No weddings, receptions, or concerts are proposed. The parcel is under a prime Land Conservation Contract. No vines will be removed to accommodate the winery facility or related site infrastructure. The property is located at 7097 Westside Road, Healdsburg; APN APNs: 110-240-031, -032, and -040; Land Intensive Agriculture 60 acres per dwelling unit (east of Westside Road) and Land Intensive Agriculture 100 acres per dwelling unit (west of Westside Road); Supervisorial District No. 4 and 5.

WHEREAS, a Mitigated Negative Declaration was prepared for the Project and noticed and made available for agency and public review in accordance with the California Environmental Quality Act ("CEQA") and the State and County CEQA Guidelines; and

WHEREAS, in accordance with applicable provisions of law, the Board of Zoning Adjustments held a public hearing on September 21, 2017, at which time the Board of Zoning Adjustments heard and received all relevant testimony and evidence presented orally or in writing regarding the Mitigated Negative Declaration and the Project. All interested persons were given an opportunity to hear and be heard regarding the Mitigated Negative Declaration and the Project; and

WHEREAS, the Board of Zoning Adjustments has had an opportunity to review this Resolution and finds that it accurately sets forth the intentions of the Board regarding the Mitigated Negative Declaration and the Project.

NOW, THEREFORE, BE IT RESOLVED that the Board of Zoning Adjustments makes the following findings:

1. The Board of Zoning Adjustments has considered the Mitigated Negative Declaration prepared to address environmental impacts of the project, together with all comments received during the public review process. Based upon the full record of proceedings (including the Initial Study and all comments received), there is no substantial evidence that the project as approved will have a significant environmental effect because Mitigation Measures have been incorporated into the Project as Conditions of Approval and agreed upon by the project applicant. Changes or alterations have been required of or incorporated into the project through the Conditions of Approval that mitigate or avoid the potentially significant environmental effects of the proposed project. These changes or alterations have been agreed to by the applicant and are subject to the Mitigation Monitoring Program contained in the Conditions of Approval. The Mitigated Negative Declaration has been completed in compliance with State and County CEQA guidelines and reflects the independent judgment and analysis of the County of Sonoma.

2. The project is consistent with the General Plan land use designation of Land Intensive Agriculture, and General Plan objectives to facilitate County agricultural production by allowing agricultural processing facilities and uses, including a winery and wine cave, in the Agricultural Land Use categories (Objectives AR 1.1, AR 1.2 and AR 5.1). Processing of agricultural products of a type grown or produced primarily on site or in the local area and tasting rooms and other temporary, seasonal, or year-round sales and promotion of agricultural products grown or processed in the county, subject to the criteria of General Plan Policies AR-5c, AR-5g, AR-6d, and AR-6f, are uses permitted with a Use Permit in the LIA zoning district. The project is consistent with General Plan Goal AR-5, which states that agricultural support services should be conveniently and accessibly located to the primary agricultural activity in the area because the winery is located in an area producing wine grapes and located within the Russian River Appellation. Tasting rooms, agricultural promotional events and industry-wide events will promote the winery and the wines produced on the site, educate visitors on the making of wines, and increase wine club membership; all as part of the marketing of an agricultural product grown and processed in Sonoma County. These activities are consistent with General Plan Objectives AR-1.1, AR 1.2, AR 5.1 and General Plan Policies AR-1a, AR-4a, AR-5c, AR-5g, AR-6a and AR-6d.

3. The primary potential land use conflicts associated with the proposed agricultural processing and visitor-serving uses, including the winery, tasting rooms, agricultural promotional events, and industry-wide events are aesthetics, exterior lighting, traffic, parking, hydrology and water use, water quality, and noise. Conditions of approval have been incorporated into the project to reduce these and all other potential impacts to a less than significant level. The proposed design plans to convert the two existing hop kiln buildings into tasting rooms received preliminary approval in a joint session of the Sonoma County Landmarks Commission and the Design Review Committee. The two hop kiln buildings are dilapidated and unless they are rehabilitated, the County could lose an important part of the local agricultural heritage. The joint committee also recommended approval of allowing the two hop kiln buildings to remain within the scenic corridor setback along Westside Road and to be kept at their present height, which exceeds the 35-foot height limit in the LIA zoning district. A condition of approval requires that HD (Historical District) zoning be placed on the east side of the project site where the hop kiln buildings are located. The winery building and wine caves on the

west side are located outside the 200-foot scenic corridor setback and meet other setback requirements and the 35-foot height limit in the LIA zoning district. All elements of the final site plan and design require final approval by the Design Review Committee and the Landmarks Commission prior to issuance of building permits, to ensure compliance with conditions of approval and mitigation measures related to aesthetics, neighborhood compatibility and preservation of historic and cultural resources. New exterior lighting shall be low mounted, downward casting, and fully shielded to prevent glare. Lighting shall be shut off automatically after closing and security lighting shall be motion-sensor activated.

The Final Traffic Study prepared for the project by the traffic engineer from W-Trans, dated March 10, 2016, was reviewed and accepted by the Sonoma County Department of Transportation and Public Works. An Addendum letter prepared by W-Trans, dated April 21, 2017, explains that collision history for the study area indicates there were two collisions on the study segment in the most recent five-year period according to California Highway Patrol records. The collision rate is below average and according to the traffic engineer of W-Trans, the segment appears to be operating within expected safety parameters. The Conditions of Approval require driveway improvements, right of way dedication, and provision of all parking on site with no parking allowed on Westside Road. The frequency and size of agricultural promotional events are limited, and industry wide events will be two days total. Sight distances along Westside Road from the existing driveway locations were evaluated by W-Trans based on sight distance criteria contained in “A Policy on Geometric Design on Highways and Streets,” published by American Association of State Highways and Transportation Officials (AASHTO). The stopping sight distance criterion for private street intersection was applied by W-Trans for this evaluation. The minimum stopping sight distance needed for an approach speed of 35 mph is 250 feet. Sight distance to the north of the tasting room driveway on the east side, after removal of the existing Westside Farms sign, is more than 400 feet. To the south of the tasting room driveway, the sight distance is more than 400 feet, which is more than adequate for the speed of traffic. The sight distance to the south of the winery driveway on the west side is 250 feet. To the north of the winery driveway, vegetation will be removed and the northwesterly hillside of the project site lowered and terraced to allow a sight distance of 250 feet, in accordance with a letter report, Grading and Cross Section Plan, and a Stopping Sight Distance plan prepared by the applicant’s engineer, Adobe & Associates. Adobe & Associates also prepared a video simulation showing vehicles traveling along the project site with the sight distance improvements completed and sight stopping distance scenario. An Addendum letter from the traffic engineer of W-Trans, dated September 13, 2017, explains that with these improvements to increase sight lines to the north to at least 250 feet, sight lines will be adequate to allow safe operation of the driveway. Also, an existing mirror across Westside Road on the project site will remain and will extend sight lines.

In addition, a mitigation has been incorporated into the project to limit guest capacity for agricultural promotional events on the west side of the project site to a maximum of 30 guests which equals 12 vehicles using the standard ratio of 2.5 persons per vehicle. Industry wide events will not be held on this portion of the project site. A Traffic Control and Parking Management Plan has been prepared by the applicant to demonstrate queing areas for guest vehicles along the two project driveways for the winery and tasting rooms and the locations of parking attendants on duty for the duration of events. A Traffic Study’s sensitivity analysis was done to demonstrate that even with events happening at the same time at more than one winery, there would not be traffic conflicts or an overconcentration of use. However, a condition has been added to the Use Permit to require event coordination between the Ramey winery and the two closest wineries (Williams-Seylem and Arista) for larger events of 100 guests or more, with the exception of the two industry wide event days since these event days are set by the Russian River Valley Grape Growers Association. The conditions also prohibit scheduling larger events during large organized bicycle events. Furthermore, a standard condition is included in the Use Permit requiring the applicant to participate in a future event coordination program to be used for wineries.

Based on the results of the Noise Assessment, dated March 2017 and the Noise Addendum dated August 2017 prepared by Illingworth & Rodkin, Inc., due to the distance of sensitive receptors (residences) and consistency with Table NE 2 of the Noise Element of the General Plan, mitigation is required to reduce heavy truck noise and mechanical and bottling noise. By extending a proposed retaining wall on and along the southerly property line next to the winery building, placing solid walls in the area of the mechanical room and restricting nighttime truck use and nighttime bottling, the noise standards of the General Plan can be met. Conditions of approval provide mitigation to reduce potential noise impacts from the different site features and buildings. The use of amplified music and sound, loud instruments (drums, cymbals, horns, and similar instruments) and acoustical music are only permitted indoors in the two tasting room buildings during daytime hours until 9 P.M. with doors and windows closed. Amplified music within the tasting room buildings shall be maintained at normal, not peak amplification levels, such that the L50 level of the amplified music not exceed 72 dBA at a distance of 50 feet. No outdoor music or use of sound systems is permitted around the tasting room buildings. No amplified music or sound is permitted either indoors or outdoors at the winery building. Outdoor events can only occur within the Picnic Grove Area until 9 P.M. and may use amplified speech limited to sound systems mechanically set to a volume level no greater than 78 dBA at 50 feet. In the Picnic Grove Area, the use of quieter, non-amplified, acoustic musical instruments (such as piano, stringed instruments, woodwinds, flute, etc.) not exceeding the level of ordinary conversations, is permitted outdoors, during daytime hours until 9 P.M. Prior to temporary or final occupancy of the winery building or tasting room buildings, a long term, on-going Noise Management and Monitoring Plan for event activities shall be submitted and cleared by the Permit Sonoma Health Specialist. The Plan shall be implemented for the project operations. The applicants have agreed to the Mitigation Measures and Monitoring program.

The Groundwater Availability Study prepared by EBA Engineering concludes that the water supply characteristics of the underlying aquifer utilized by Wells #1 and #3 are more than adequate to accommodate the water demands associated with the proposed project and will not result in negative impacts to local groundwater or surface water resources. This conclusion is based on the fact that the project site is located within a Class 1 water area, identified in the Sonoma County General Plan as a major groundwater basin, and the underlying aquifer is comprised of alluvial deposits associated with the Russian River, which is a managed water system that ensures perennial flow throughout the year and serves as a continuous source of recharge to the aquifer. The projected radius of influence characteristics induced by the pumping operations will not encroach onto neighboring properties. In addition, the proposed water use is projected to induce no measurable changes in surface water flows in the Russian River.

All project development will be over 800-feet from the Russian River. According to the Plan, there will be a slight increase in runoff for the 2-year 24-hour storm as a result of the proposed improvements. The increase in the runoff in the area of the winery improvements will be captured in the existing pond. The existing pond will have adequate capacity to capture increase. Water treatment will be achieved by allowing the runoff to flow through vegetated buffer areas prior to entering the pond. There will be a slight increase in runoff east of the tasting room improvements that will infiltrate into the existing vegetation prior to exiting the property. The Best Management Practices incorporated into the proposed project, including the vegetated buffer areas, will provide the necessary treatment to meet the County's Low Impact Development (LID) requirements. . These improvements as designed would reduce the potential impacts on water quality to a level of less than significant.

The industrial wastewater from the proposed winery processing will be collected, aerated and stored in a series of treatment tanks to be disposed of via an irrigation system to serve the on-site vineyard. Domestic sewage disposal from the tasting rooms, marketing accommodations, guest and employee restrooms will be disposed of via on-site septic systems adjacent to the tasting room buildings on the east side and near the existing farmhouse on the west side. Both the winery wastewater system and the domestic systems will be designed by an engineer to meet all applicable standards. The property consists of flat gentle sloping terrain with slopes ranging between 5-15 percent. The soil classification of the project site is "Yolo Loam" which is commonly found in the Russian River and Dry Creek Valleys and described as sandy loam, gravelly loam, silt loam, and clay loam surface layers in some areas. Yolo Loam is suitable for domestic and industrial wastewater disposal systems. The Russian River forms the eastern boundary to the property. Both the winery wastewater system and domestic septic systems will be more than 800 feet from the Russian River.

4. The proposal is consistent with the LIA (Land Intensive Agriculture) zoning designation, which allows the following under Section 26-040-020 (i) of the Zoning Ordinance with a Use Permit approval: tasting rooms and other temporary, seasonal or year-round sales and promotion of agricultural products grown or processed in the county. Sonoma County has a long history of permitting agriculture promotional events at wineries as a marketing tool that promotes the wine produced or grown on site. Project conditions of approval prohibit the winery facility from being rented out to third-parties for any activities, including events, weddings, or concerts.

5. The project is consistent with the Land Conservation Act because: 1) the project will be supportive of agricultural production on the project and in the local area; 2) the project would not affect the agricultural use on adjacent properties because noise will be controlled and all parking needs can be accommodated on the project site; 3) the project site will continue to be devoted to agricultural use because well over fifty percent of the property is planted in vines; 4) all other uses, including the winery building, tasting rooms, associated parking, landscaping and outdoor activity area, and existing residence are compatible with the agricultural use of the property and are consistent with the Land Conservation Act's Principles of Compatibility and the County's Uniform Rules for Agricultural Preserves. The existing and proposed development will collectively occupy no more than 3.75 acres of the 75 acre site, which meets the threshold to ensure that they remain incidental to the primary use of the land for agriculture; 5) there will be

no removal or displacement of vines; 6) operation of the tasting rooms and hosting agricultural promotional events are consistent with the Land Conservation Act because they are marketing tools to help sell the wine produced on-site and ensure the long term viability of the vineyard and processing facility; 7) no permanent structures solely devoted to the agricultural promotional event activities will be constructed on the site, and none of the events will last more than two consecutive days; 8) the marketing accommodations for two guest rooms are consistent with the local Uniform Rules; and 9) the agricultural promotional events and industry-wide events are annually limited in number, duration, and scope to ensure that the increase in the temporary human population drawn to the site will not hinder or impair agricultural operations.

6. The establishment, maintenance or operation of the use for which application is made will not, under the circumstances of this particular case, be detrimental to the health, safety, peace, comfort and general welfare of persons residing or working in the neighborhood of such use, nor be detrimental or injurious to property and improvements in the neighborhood or the general welfare of the area. As discussed in Finding 2 above, in summary, the particular circumstances in this case are: exterior lighting must be low mounted, downward casting and fully shielded to prevent glare, lighting shall shut off automatically after closing and security lighting shall be motion-sensor activated; Westside Road is adequate to support the volume of traffic associated with the proposed land uses; improvements will be done on the project site to provide adequate northerly sight line on the winery side of the project site, the project will not compromise agricultural capability because the proposed use is related to agriculture and no vines will be removed to accommodate the project; and mitigations have been incorporated into the project to ensure that noise from construction, winery operations, and agricultural promotional event and industry wide event activities shall meet the Daytime Noise limit standards established in the General Plan, with limited hours of event activities, and the conditions placed on the project to control noise and restrict the use of any outdoor amplified music and sound systems. Other project related circumstances include that the project will not create a detrimental concentration of visitor-serving and recreational uses because the traffic generated by the project will not result in road access conflicts; the project will preserve historic resources important to the local agricultural heritage and the rural character of the neighborhood; the project applicant will coordinate agricultural promotional events with the two adjacent wineries to off-set event days and/or event times , and no event will be held the same time as a large bicycle event. The project site wells will not affect or cause a significant drawdown of neighboring wells in the area or the Russian River; a Traffic Control and Parking Management Plan will be implemented to control guest traffic entering and exiting the project site, and guest vehicle parking and movement on the project site. Use of amplified music or sound and loud musical instruments are only permitted indoors at the tasting room buildings during daytime hours with doors and windows closed. Outdoor events and activities, including outdoor wine tasting, are only permitted at the Picnic Walnut Grove area, as depicted on the Site Plan. In the Picnic Walnut Grove area, amplified speech is limited to sound systems mechanically set to a volume level no greater than 78 dBA at 50 feet. The winery's Use Permit is under a one-year review of event activities after commencement of the first event to determine condition compliance.

BE IT FURTHER RESOLVED that the Board of Zoning Adjustments hereby adopts the Mitigated Negative Declaration and Mitigation Monitoring Program set forth in the Conditions of Approval. The Board of Zoning Adjustments certifies that the Mitigated Negative Declaration has been completed, reviewed, and considered, together with comments received during the public review process, in compliance with CEQA and State and County CEQA Guidelines, and finds that the Mitigated Negative Declaration reflects the independent judgment and analysis of the Board.

BE IT FURTHER RESOLVED that the Board of Zoning Adjustments hereby grants the requested Use Permit, subject to the Conditions of Approval in Exhibit ‘’A’‘, attached hereto.

BE IT FURTHER RESOLVED that the Board of Zoning Adjustments designates the Secretary as the custodian of the documents and other material which constitute the record of proceedings upon which the Board’s decision herein is based. These documents may be found at the office of the Sonoma County Permit and Resource Management Department, 2550 Ventura Avenue, Santa Rosa, CA 95403.

BE IT FURTHER RESOLVED that the Board of Zoning Adjustments’ action shall be final on the 11th day after the date of the Resolution unless an appeal is taken.

THE FOREGOING RESOLUTION was introduced by Commissioner , who moved its adoption, seconded by Commissioner , and adopted on roll call by the following vote:

Commissioner
Commissioner

Re: Review of Ramey Winery Project Traffic Impact Analysis

Alta Planning + Design has reviewed the traffic study conducted by W-Trans for the Ramey Winery Project in Sonoma County, CA. This memorandum summarizes the results of this review. The traffic study performed by W-trans provides thorough explanation regarding the methodology used to assess the anticipated impacts of the Ramey Winery project. W-trans used a conservative approach to assume the existing traffic volumes, and applied the appropriate level of service methodology for the existing conditions analysis, which uses percent time spent following thresholds to determine levels of service. W-trans also appropriately used Sonoma County's Winery Trip Generation form, as the ITE Trip Generation Manual does not include data for wineries.

There is concern regarding the reported 85th percentile speed that could impact the required sight distance for vehicles leaving the winery driveways from a stop condition. The 85th percentile speed plays a large role in determining the required sight distance for the driveways later in the report.

The report indicates there is not currently a posted speed limit on Westside Road. Based on a spot speed study performed by W-Trans, the 85th percentile travel speed on Westside Road is reported as 35 mph. However, the calculation for determining the 85th percentile speed from the data provided is not clear. The average speed for each hour is provided in the attachment, instead of a full set of speed captures for an entire hour. A spot study should be conducted during a non-peak hour when vehicles are expected to travel at free flow conditions rather than a peak hour when vehicles could be experiencing congestion. Vehicle speeds should be captured for an entire hour, or during the time it takes to capture 100 vehicle speeds, whichever occurs first. Based on a set of data from either 100 vehicles or an hour of vehicles, the 85th percentile speed can be calculated.

Based on the average speed data provided in the attachment, it appears that the 85th percentile speed could be higher than 35 mph. It would be reasonable to request that the calculations or data set used to determine the 85th percentile speed be provided.

The 85th percentile speed should be used to determine the sight distance for vehicles exiting the winery driveway from a stop condition. This type of sight distance is referred to in AASHTO's *A Policy on Geometric Design of Highways and Streets* as "departure sight triangles" and referred to in the California Highway Design Manual as "corner sight distance".

Assuming the speed is 35 mph, the left turn sight triangle and right turn sight triangle from stop should be 390' and 335', respectively. However, if the 85th percentile speed is higher, as speculated, these sight triangles would be increase. **Therefore, the 85th percentile speed should be calculated based on a speed study as discussed above in order to accurately determine the minimum intersection sight distance for passenger cars exiting the winery, making left and right turns onto Westside Road.**

Memorandum

Date: **September 20, 2017**

To: **Traci Tesconi**
Supervising Planner
Permit Sonoma

Subject: **Review of Ramey Winery Project Traffic Impact Analysis**

File No: **UPE14-0008**

Traci,

Sonoma County Department of Transportation and Public Works (DTPW) has reviewed the memorandum regarding the *Review of Ramey Winery Project Traffic Impact Analysis* from Alta Planning and Design, dated September 14, 2017.

The memorandum states the methodology from W-Trans for determining the 85th percentile travel speed was not clear. Alta states the spot study should be conducted during a non-peak hour for an entire hour, or during the time it takes to capture 100 vehicle speeds, whichever occurs first. Our review of the W-Trans data revealed the speed study in the accepted March 10, 2016 report complies with the requirements stated by Alta and is consistent with standard engineering practice for performing engineering speed studies.

Therefore, Transportation and Public Works is satisfied with and accepts the results of the W-Trans methodology for determining the 85th percentile speed and necessary stopping sight distance.

Re: Response to Comments for Ramey Vineyards

The following are Wildlife Research Associates and Jane Valerius Environmental Consulting's response to comments from the Westside Farms Winery and Hospitality Complex [UPE14-0008] memo dated August 10, 2018 (Avocet Research Associates LLC 2018):

The comments from Avocet Research Associates LLC and its principal, Jules Evens, are numbered, and each is followed by a response paragraph from Wildlife Research Associates and Jane Valerius Environmental Consulting below.

1) *Comment*: Mr. Evens' letter and CV recite his experience on other properties, including one property in the Russian River area.

Response: The analysis for the Ramey Vineyards project is based on site-specific analysis for this property. Also, the experts preparing this analysis have substantial experience in analyzing the amphibian species in question. While Mr. Evans' background is with birds, Trish Tatarian has conducted radio-telemetry research on the federally-listed Threatened California red-legged frog (*Rana draytonii*) in three different populations and with the Endangered Sonoma County population of the California tiger salamander (*Ambystoma californiense*). She has contributed new records of new locations for the California red-legged frog in Alameda, Contra Costa, Marin, San Mateo and Sonoma counties, and of the California tiger salamander in Alameda, Contra Costa, San Benito, San Joaquin and Sonoma counties to the California Natural Diversity Data Base (CNDDB). Since 2013, she has taught the California red-legged Frog Workshops through the Livermore Resource Conservation District, the Elkhorn Slough Coastal Training Program, the Auburn Resource Conservation District and California Polytechnic University, Swanton Ranch.

2) *Comment*: Mr. Evens is familiar with the local fauna

Response: Each site is evaluated on a site by site basis and each pond/reservoir provides different habitats based on management techniques. Distance alone is not a determination of similarity.

For example, this pond has an active water fern (*Azolla filiculoides*) removal program that includes two aerators in the deepest portion of the pond. Water fern can form a dense mat over the pond reducing water temperatures that may be unfavorable to breeding California red-legged frog (pers. observation). Previous owners had stocked the pond with carp, which are still present, along with mosquitofish. The strong bullfrog population, which was documented in 2014,, together with the carp, which feed on algae and small invertebrates (which are tadpole foods) and mosquitofish, which have also been shown to reduce California red-legged frog survivorship, results in a heavy predator load.

3) *Comment*: No special status species surveys were conducted

Response: This is incorrect. The surveys conducted in April and May 2014 were specifically for special status plants and were selected to address those plant species that had the potential to occur on site, based on the presence of potential habitat. All of the special status plants with the potential to occur would have been in flower during that time period. Also, as required, plant surveys were floristic, meaning that all plant species identifiable during the surveys were recorded, which covers both common and special status plants and also any plants that may come up in the future as special status. Special status plant surveys are typically conducted because plants are not as mobile as wildlife species.

We state in our Habitat Assessment in 2014 that no focused surveys were conducted, which refers to surveys for special status *wildlife* species and not plants as described above. Typically, Habitat Assessments are conducted well in advance of the proposed project and only provide a snap shot in time of the occupancy of the parcel. For many species, survey results become out of date after 5 years, which then requires additional surveys. For nesting birds, this time frame can be as short as one year. In our 2014 report, we recommended conducting nesting bird surveys prior to habitat removal if the habitat was to be removed during the bird nesting season, which we identified as being between February 15 and August 15. Under CEQA, non-active nests of birds are not protected, except for California fully protected species. We observed no California fully protected species on the site.

We did a bat habitat assessment as part of the 2014 report, because typically, bats have a greater fidelity to the roost sites, than say passerines (perching birds). The assessment was to determine the suitability of the habitat and if potentially suitable habitat is present, we assume occupancy and provide measures to prevent take of individuals.

The site visit in 2014 was conducted during the spring, which is a suitable time period to detect basking or floating western pond turtle (*Emys marmorata*). However, none were observed. Our May 5, 2017, *Response to Sonoma County Counsel Request for More Information – Ramey Wine Cellars* (Wildlife Research Associates 2017), identifies mitigation measures to prevent take of western pond turtle despite the statement that no western pond turtles were observed in the reservoir at the time of the 2014 survey, or in subsequent surveys in 2015 and 2016. We stated that there is suitable aquatic habitat present that may be occupied in the future. Measures to protect potential habitat and individuals are described in detail in that letter report.

4) *Comment*: Field visits and coverage referenced in those reports was minimal (two dates: 28 April and 12 May 2014) therefore insufficient to accurately assess the status of several special status species.

Response: We disagree. We chose two dates that were within the flowering season and breeding season for most species. Habitat Assessments are typically conducted to ascertain the habitats on the parcel and to provide measures to prevent loss of habitat and prevent take of individuals. As described above, the timeframe for this analysis was too far in the future for focused surveys (a term both the USFWS and CDFW use for surveying listed wildlife species), to be acceptable without having to be conducted again, if the surveys were negative. The aim of the Habitat Assessment is: a) to prevent take of individuals, through construction seasonality and pre-construction surveys; and b) replace loss of habitat for listed species (i.e., federal or State Threatened or Endangered, or Candidates for listing) that are occupying or presumed to occupy the habitat based on the existing conditions, as required under the Federal Endangered Species Act (FESA) or the California Endangered Species Act (CESA). No Federal or State listed species are known or expected to occur on the site based on current conditions.

In addition, we have conducted five additional amphibian surveys in August (17th , 24th and 30th), and September (6th and 13th) 2018; each was both a daytime and nighttime survey. These surveys were conducted during the season when tadpoles are metamorphosing into froglets (of young of the year) and would have been detected if they were present, thus showing breeding habitat. We have also conducted single nocturnal surveys with a dipnetting component during the past four years. None of the surveys have detected presence of western pond turtle or California red-legged frog.

5) *Comment*: Documents referenced to evaluate special status (plant) animal species are out-of-date

Response: Although the project description was corrected in 2017, the report was not re-evaluated for special status species in 2017. The numbers were updated in the table in the 2017 report to reflect the current drawing design.

In this response to comments letter, we have updated the analysis from the California Natural Diversity Data Base (CNDDB) for special status plants and animals for 2018. In addition, the USFWS now provides the Information for Planning and Consulting (IPaC), which was not available in 2014. We have included the run for the IPaC data base as well and the species are listed in each table at the end of these comments. Additions from the 2018 CNDDB and the 2018 IPaC are in blue.

A total of 6 plant species were added to the Special Status Plant Species table from 2014. Of these species, only 2 have potential to occur on the project site based on presence of potential habitat: hogwallow starfish (*Hesperevax caulescens*) and Gairdner's yampah (*Perideridia gairdneri* ssp. *gairdneri*). Both of these species would have been observed on the site if they were present back in 2014. The survey was conducted within the flowering period for hogwallow starfish but not Gairdner's yampah. However, both of these species have leaves that are very distinctive and different from other plant species and therefore would have been identifiable based on leaves alone, at least to the genus level. Secondly, both of these species are CNPS Rank 4 species which are not protected by CESA or CEQA and therefore mitigation is not required. However, CNPS does recommend that impacts to these species be addressed during the CEQA process. It is up to the lead agency for CEQA to determine if mitigation is required due to local conditions. Since these plants were not observed, and are not likely to occur because the grassland habitats on the site are highly modified from previous land uses (past use as a pumpkin patch with farm store, current use as a vineyard) and the fact that non-native species dominate the vegetation cover, no further action is required.

A total of 8 animal species were added to the Special Status Animal Species table from 2014 based on the CNDDB. A total of 16 species were added from the IPaC. Of these species, 5 bird species have been identified as having a high potential to occur and one bird species has a low potential to occur, based on the habitats present. Two invertebrates, bumble bees, have a low potential to occur, based on the habitats present. Although the bird species from 2018 have not been addressed specifically in the 2014 report, measures to protect bird in general were addressed in the 2014 report.

6) *Comment*: The close proximity to the Russian River and associated wetlands indicates the necessity for conducting protocol-level surveys for several special status animal species.

Response: Both the USFWS and CDFW use the term focused surveys for listed wildlife species. No focused surveys were conducted near the Russian River because no development is occurring adjacent or in close proximity to the Russian River. All development is at least 680 feet to the west. As a result, those species occurring in the Russian River will not be directly affected by the proposed project. For those species that can move away from the Russian River (e.g., amphibians and western pond turtle), measures to prevent take of individuals have been addressed in *Response to Sonoma County Counsel Request for More Information – Ramey Wine Cellars* (Wildlife Research Associates 2017) and in the comments in this letter.

7) *Comment*: California Red-Legged Frog (*Rana draytonii*) has been reported less than a mile east of the site.

Response: We disagree. Review of the 2018 CNDDB does not show any *Rana draytonii* sightings within 1 mile to the east. There are no unprocessed sightings within 1 mile to the east. If Mr. Evans continues to make this assertion, we would ask that he please provide CNDDB number and UTM coordinates of sighting. In addition, focused surveys conducted by Wildlife Research Associates in 2016 of a reservoir within 1.6 miles to the southwest did not reveal any *Rana draytonii* either. No California red-legged frogs were observed during the five surveys, comprising both daytime and nighttime surveys, conducted in August (17th, 24th and 30th), and September (6th and 13th) 2018.

8) *Comment*: Focused surveys for the California Red-Legged Frog (*Rana draytonii*) should be conducted.

Response: There is no need for focused surveys. For this portion of the Russian River area, the lack of presence of *Rana draytonii* in ponded areas, in general, negated the need for focused surveys. Surveys (both day and night) conducted between 2014 and 2018, with late summer surveys conducted in 2018 (August 17th, 24th and 30th, and September 6th and 13th), an ideal time for detecting metamorphosing young of the year showing breeding occupancy, did not reveal any *Rana draytonii* or *Emys marmorata*. Between 221 and 486 individual American bullfrogs (*Lithobates catesbeianus*) were counted at the reservoir on the property during the three (3) nocturnal surveys in August and two (2) in September 2018, showing a high predator load. Had either *Rana draytonii* or *Emys marmorata* been detected they would have been reported, as per Scientific Collecting Permit (#2619) to the CNDDB.

It is my professional opinion, based on the project location and previously conducted surveys of the pond, that focused surveys are not required for the California red-legged frog (*Rana draytonii*).

9) *Comment*: The project site's proximity (<2 miles) to the western boundary of the Potential Range of the Sonoma County California Tiger Salamander (Windsor Creek) should require consideration before approval of a negative declaration is issued.

Response: The project site is outside the species range as identified by the federal listing (USFWS 2002), the state listing (CDFW 2012), the Santa Rosa Plain Conservation Strategy (SRPCS) (USFWS 2005), the Critical Habitat designation (USFWS 2011) and the Draft Recovery Plan (USWFS 2014). There have been no reported occurrences of California Tiger Salamander on the north or west side of the Russian River. The Russian River likely acts as a major barrier to movement for California tiger salamander. A copy of the California Tiger Salamander range map and Core Mitigation Areas for this portion of Sonoma County is attached to this letter.

10) *Comment*: Western pond turtle was not addressed

Response: We disagree. This species was addressed in our additional report, *Response to Sonoma County Counsel Request for More Information – Ramey Wine Cellars* (Wildlife Research Associates 2017), that discusses mitigation measures to avoid take of *Emys marmorata* if the animal begins to occupy the reservoir. Surveys conducted in the spring of 2014, and annual subsequent surveys at the pond together with our 2018 surveys have not revealed any western pond turtle.

Emys marmorata has been reported in the Russian River < 1 mile to the east. However, no proposed development on this property is near the Russian River.

11) *Comment*: Address the Errata in the Assessment

Response: The species designations for chestnut-backed chickadee (*Poecile rufescens*) and oak titmouse (*Baeolophus inornatus*) have been noted. The mitigation measures presented in the Habitat Assessment remain the same to prevent take of passerines (perching birds).

Although white-tailed kites are irruptive and highly nomadic, they are very specific in their nesting and foraging requirements. They typically build a platform of sticks in the fork of a tree or tall brush, which would have been easily detected at the time of the survey in 2014. Several factors have been reported as important in successful white-tailed kite nests and include the following: 1) nests occur in rows or patches of trees overlooking low-lying natural vegetation, fallow fields, wet pasture, or alfalfa; 2) nests are less than 1,500 meters (4,921 feet) from fresh water; 3) nests are greater than 100 meters (328 feet) from roads; and 4) nests are within 800 meters (2,625 feet) of natural, fallow, or riparian vegetation (Erichsen et al 1996). Orchard, vineyards, and most row crops are not preferred foraging habitats based on the low prey base of California voles (*Microtus californicus*) (Erichsen et al 1996)

12) *Comment*: A formal delineation of wetlands and waters of the U.S. and state was not conducted as part of protocol-level surveys for special status animal species.

Response: A wetland delineation is not required as a determination of suitable habitat for special status amphibians. Wildlife habitat characteristics described in the 2014 Habitat Assessment are sufficient for determining suitable habitat for special status species. The use of the term protocol-level surveys comes from the USFWS and CDFW guidelines for conducting special status plants surveys and not for animals. For plants the surveys must be floristic, meaning that all plants identifiable at the time of the survey must be recorded, as state above. The purpose of a wetland delineation is to identify areas under the jurisdiction of the U.S. Army Corps of Engineers (USACE), which also falls under the jurisdiction of the state RWQCB and in some cases CDFW. A formal delineation, conducted in accordance with the USACE guidelines and manuals, was not needed because the project is designed to avoid any wetlands or waters of the U.S. and state, as discussed in the Habitat Assessment. The drainages on the east side will be avoided as the drainage crossings are designed to span any ditches or creeks so there will be no fill of any creeks or drainages. The pond, drainages and other aquatic features on the site were reviewed for potential special status and common wildlife species as described above, so any potential impacts to wildlife species were addressed in the Habitat Assessment as described above.

We appreciate the opportunity to submit these responses.

Appendix B: Potentially Occurring Special Status Plant Species in the Study Area - 2018

Scientific Name **Common Name**	**Status USFWS/ CDFW/ CNPS list**	**Habitat Affinities and Blooming Period/Life Form**	**Potential for Occurrence**
Alopecurus aequalis var. *sonomensis* Sonoma alopecurus	FE/-/1B	Freshwater marshes and swamps, riparian scrub. May-July. Elevation: 5-365m.	None. No habitat present in study area.
Amorpha californica var. *napensis* Napa false indigo	-/-/1B	Broadleafed upland forest (openings), chaparral, cismontane woodland. Blooms April-July. Elevation: 120-2000m.	None. No habitat present in study area.
Arctostaphylos bakeri ssp. *bakeri* Baker's manzanita	-/CR/1B	Broadleafed upland forest, chaparral often on serpentinite. Blooms February to April. Elevation: 75-300m.	None. No habitat present in study area.
Arctostaphylos bakeri ssp. *sublevis* The Cedars manzanita	-/CR/1B	Closed-cone coniferous forest, chaparral, often on serpentine. Blooms February to April.	None. No habitat present in study area.
Arctostaphylos densiflora Vine Hill manzanita	-/CE/1B	Chaparral on acid marine sand. February-April. Elevation: 50-120m.	None. No habitat present in study area.
Arctostaphylos hispidula Howell's mananita	-/-/1B	Chaparral on serpentinite or sandstone. Blooms March to April. Elevation: 120-1250m.	None. No habitat present in study area.
Arctostaphylos stanfordiana ssp. *decumbens* Rincon Ridge manzanita	-/-/1B	Chaparral on rhyolitic soils and cismontane woodland. Blooms February to April (sometimes May). Elevation: 75-370m.	None. No habitat present in study area.
Blennosperma bakeri Sonoma sunshine	FE/CE/1B	Valley and foothill grassland (mesic), vernal pools. Blooms March to May. Elevation: 10-110m.	None. Not observed during surveys. Typical habitat not present in study area.
Brodiaea leptandra Narrow-anthered brodiaea	-/-/1B	Broadleafed upland forest, chaparral, cismontane woodland, lower montane coniferous forest, valley and foothill grassland on volcanic soils. Blooms May to July. Elevation: 110-915m.	None. Typical habitat present in study area. Not observed during surveys.
Calamagrostis bolanderi Bolander's reed grass	-/-/4	Bogs and fens, broadleafed upland forest, closed-cone coniferous forest, coastal scrub, meadows and seeps, freshwater marshes and swamps, North Coast coniferous forest on mesic sites. May-August. Elevation: 0-455m.	None. No habitat present in study area. Not observed during surveys.
Calamagrostis crassiglumis Thurber's reed grass	-/-/2B	Coastal scrub (mesic), freshwater marshes and swamps. Blooms April to July. Elevation: 90-1065m.	None. No habitat present in study area. Not observed during surveys.
Campanula californica Swamp harebell	-/-/1B	Bogs and fens, closed-cone coniferous forest, coastal prairie, meadows and seeps, freshwater marshes and swamps, North Coast coniferous forest. June-October. Elevation: 1-405m.	None. No habitat present in study area.
Carex comosa Bristly sedge	-/-/2B	Coastal prairie, marshes and swamps, lake margins, mesic sites in grasslands. Blooms May to Sept.	None. No habitat present in study area.
Castilleja ambigua var. *ambigua* Johnny-nip	-/-/4	Coastal bluff scrub, coastal prairie, coastal scrub, marshes and swamps, valley and foothill grassland, margins of vernal pools. Blooms March to August. Elevation 0-435m.	None. Typical habitat not present in study area. Not observed during surveys.
Castilleja uliginosa Pitkin Marsh paintbrush	-/CE/1A	Freshwater marshes and swamps. June-July. Elevation: 60m.	None. No habitat present in study area.

Scientific Name **Common Name**	**Status USFWS/ CDFW/ CNPS list**	**Habitat Affinities and Blooming Period/Life Form**	**Potential for Occurrence**
Ceanothus confusus Rincon Ridge ceanothus	-/-/1B	Closed-cone coniferous forest, chaparral, cismontane woodland on volcanic or serpentinite. Blooms February to June. Elevation: 75-1065m.	None. No habitat present in study area..
Ceanothus foliosus var. *vineatus* Vine Hill ceanothus	-/-/1B	Chaparral. March-May. Elevation: 45-305m.	None. No habitat present in study area.
Ceanothus gloriosus var. *exaltatus* Glory brush	-/-/4	Chaparral. Blooms March to August. Elevation: 30-610m.	None. No habitat present in study area.
Ceanothus purpureus Holly-leaved ceanothus	-/-/1B	Chaparral and cismontane woodland with rocky, volcanic substrate. Blooms February to June. Elevation: 120-640m.	None. No habitat present in study area.
Centromadia parryi ssp. *parry* Pappose tarplant	-/-/1B	Chaparral, coastal prairie, meadows and seeps, coastal marshes and swamps, valley and foothill grassland on vernally mesic, often alkaline sites. May-November. Elevation: 2-420m.	None. Typical habitat not present in study area. Not observed during surveys.
Chorizanthe valida Sonoma spineflower	FE/CE/1B	Coastal prairie on sandy soils. Blooms June to August. Elevation: 10-305m.	None. No habitat present in study area.
Clarkia imbricata Vine Hill clarkia	FE/CE/1B	Chaparral, valley and foothill grassland on acidic sandy loam soils. June-August. Elevation: 50-75m.	None. No habitat in study area.
Cordylanthus tenuis ssp. *brunneus* Serpentine bird's-beak	-/-/4	Closed-cone coniferous forest, chaparral, cismontane woodland on serpentinite. Blooms July to August. Elevation: 475-915m.	None. No habitat present in study area.
Cordylanthus tenuis ssp. *capillaris*	FE/CR/1B	Closed-cone coniferous forest, chaparral on serpentinite. June-September. Elevation: 45-305m.	None. No habitat in study area.
Cuscuta obtusiflora var. *glandulosa*	-/-/2B	Freshwater marshes and swamps. July-October. Elevation: 15-280m.	None. No habitat in study area.
Cypripedium montanum Mountain lady's-slipper	-/-/4	Broadleafed upland forest, cismontane woodland, lower montane coniferous forest, North Coast coniferous forest. Blooms March to August. Elevation: 185-225m.	None. No habitat in study area. Not observed during April and May surveys.
Delphinium bakeri Baker's larkspur	FE/CE/1B	Broadleafed upland forest, coastal scrub, valley and foothill grassland, on decomposed shale, often mesic. Blooms March to May. Elevation: 80-305m.	None. Typical habitat not present in study area. Not observed during surveys.
Delphinium luteum Golden larkspur	FE/CR/1B	Chaparral, coastal prairie, coastal scrub on rocky soils. March-May. Elevation: 0-100m.	None. Not observed during surveys. Habitat not present on site.
Downingia pusilla Dwarf downingia	-/-/2B	Valley and foothill grassland (mesic), vernal pools. Blooms March to May. Elevation: 1-445m.	None. Not observed during surveys. Typical habitat not present in study area.
Erigeron biolettii Streamside daisy	-/-/3	Broadleafed upland forest, cismontane woodland, North Coast coniferous forest on rocky and mesic sites. Blooms June-October. Elevation 30-1100m.	None. No habitat present in study area.
Erigeron greenei Greene's narrow-leaved daisy	-/-/1B	Chaparral on serpentinite or volcanic soils. Blooms May to September. Elevation: 80-1005m.	None. No habitat present in study area.

Scientific Name **Common Name**	**Status USFWS/ CDFW/ CNPS list**	**Habitat Affinities and Blooming Period/Life Form**	**Potential for Occurrence**
Erigerion serpentinus Serpentine daisy	-/-/1B	Chaparral on serpentine and seeps. May-August. Elevation: 60-670m.	None. No habitat in study area.
Eriophorum gracile Slender cottongrass	-/-/4	Bogs and fens, meadows and seeps, upper montane coniferous forest on acidic soils. Blooms May to September. Elevation: 1280-2900m.	None. No habitat in study area.
Fritillaria liliacea Fragrant fritillary	-/-/1B	Cismontane woodland, coastal prairie, coastal scrub, valley and foothill grassland often on serpentinite. Blooms February to April. Elevation: 3-410m.	None. Not observed during surveys. Typical habitat not present in study area.
Gilia capitata ssp. *tomentosa* Woolly-headed gilia	-/-/1B	Coastal bluff scrub, valley and foothill grassland on serpentinite or rocky soils or outcrops. Blooms May to July. Elevation: 10-220m.	None. Not observed during surveys. Typical habitat not present in study area.
Hemizonia congesta ssp. *congesta* White seaside tarplant	-/-/1B	Valley and foothill grassland sometimes on roadsides. Blooms April to November. Elevation: 20-560m.	None. Not observed during surveys. No species of *Hemizonia* were observed in the study area.
Hesperevax caulescens Hogwallow starfish	-/-/4	Valley and foothill grassland (mesic, clay), vernal pools (shallow), sometimes alkaline. Blooms March to June. Elevation: 0-505m.	None. Potential grassland habitat on site but no alkaline soils. Not observed during April and May surveys.
Horkelia tenuiloba Thin-leaved horkelia	-/-/1B	Broadleafed upland forest, chaparral, valley and foothill grassland in mesic openings and on sandy soils. Blooms May to July. Elevation: 50-500m.	None. Not observed during surveys. No habitat present in study area.
Hosackia gracilis Harlequin lotus	-/-/4	Broadleafed upland forest, coastal bluff scrub, closed-cone coniferous forest, cismontane woodland, coastal prairie, coastal scrub, meadows and seeps, marshes and swamps, North Coast coniferous forest, valley and foothill grassland/wetlands, roadsides. Blooms March to July. Elevation: 0-700m.	None. Not observed during surveys. Typical habitat not present in study area.
Iris longipetala Coast *iris*	-/-/4	Coastal prairie, lower montane coniferous forest, meadows and seeps in mesic sites. Blooms March to May. Elevation 0 -600 m.	None. Typical habitat not on site. Not observed during April or May survey.
Kopsiopsis hookeri Small groundcone	-/-/2B	North Coast coniferous forest. Blooms April to August. Elevation: 90-885m.	None. No habitat on site. Not observed during April or May survey.
Lasthenia burkei Burke's goldfields	FE/CE/1B	Meadows and seeps (mesic), vernal pools. April-June. Elevation: 15-600m.	None. Not observed during surveys. No habitat present in study area.
Lasthenia californica ssp. *bakeri* Baker's goldfields	-/-/1B	Closed-cone coniferous forest (openings), coastal scrub, meadows and seeps, marshes and swamps. April-October. Elevation: 60-520m.	None. Not observed during surveys. No habitat present in study area.
Legenere limosa Legenere	-/-/1B	Vernal pools. Blooms April-June. Elevation: 1-880m.	None. Not observed during surveys. No habitat present in study area.

Scientific Name **Common Name**	**Status USFWS/ CDFW/ CNPS list**	**Habitat Affinities and Blooming Period/Life Form**	**Potential for Occurrence**
Leptosiphon jepsonii Jepson's leptosiphon	-/-/1B	Chaparral, cismontane woodland, usually volcanic. Blooms March to May. Elevation: 100-500m.	None. Not observed during surveys. No habitat present in study area.
Lessingia arachnoidea Crystal Springs Lessingia	-/-/1B	Cismontane woodland, coastal scrub, valley and foothill grassland. Blooms July to October.	None. Not observed during surveys. Typical habitat not present in study area.
Lessingia hololeuca Woolly-headed Lessingia	-/-/3	Broadleafed upland forest, coastal scrub, lower montane coniferous forest, valley and foothill grassland. Blooms June to October. Elevation: 15-305m.	None. Not observed during surveys. Typical habitat not present in study area.
Lilium pardalinum ssp. *pitkinense* Pitkin Marsh lily	FE/CE/1B	Cismontane woodland, meadows and seeps, freshwater marshes and swamps, in mesic and sandy soils. June-July. Elevation: 35-65m.	None. No habitat present in study area.
Limnanthes vinculans Sebastopol meadowfoam	FE/CE/1B	Meadows and seeps, valley and foothill grassland, vernal pools/vernally mesic. April-May. Elevation: 15-305m.	None. Not observed during surveys. No habitat present in study area.
Microseris paludosa Marsh microseris	-/-/1B	Closed-cone coniferous forest, cismontane woodland, coastal scrub, valley and foothill grassland. April-June (sometimes July). Elevation: 5-300m.	None. Not observed during surveys. Typical habitat not present in study area.
Monardella viridis Green monardella	-/-/4	Broadleafed upland forest, chaparral, cismontane woodland. June-September. Elevation: 100-1010m.	None. No habitat on site. This species is identifiable by leaves and fragrance (minty). Not observed on site.
Navarretia leucocephala ssp. *bakeri* Baker's navarretia	-/-/1B	Cismontane woodland, lower montane coniferous forest, meadows and seeps, valley and foothill grassland, vernal pools/mesic. Blooms April to July. Elevation: 5-1740m.	None. Not observed during surveys. Typical habitat not present in study area.
Navarretia leucocephala ssp. *plieantha* Many flowered navarretia	FE/-/1B	Volcanic ash flow vernal pools. Blooms May to June. Elevation: 30-950 m.	None. Not observed during surveys. No habitat present in study area.
Perideridia gairdneri ssp. *gairdneri* Gairdner's yampah	-/-/4	Broadleafed upland forest, chaparral, coastal prairie, valley and foothill grassland, vernal pools/vernally mesic. Blooms June to October. Elevation: 0-610m.	None. Potential grassland habitat on site. The genus is identifiable by leaves and no leaves or plants that look like *Perideridia* were observed during surveys.
Pleuropogon hooverianus North Coast semaphore grass	-/CT/1B	Broadleafed upland forest, meadows and seeps, North Coast coniferous forest. Blooms April to June. Elevation: 10-671m.	None. Not observed during surveys. No habitat present in study area.
Ranunculus lobbii Lobb's aquatic buttercup	-/-/4	Cismontane woodland, North Coast coniferous forest, valley and foothill grassland and vernal pools in mesic sites. Blooms February to May. Elevation: 15-470m.	None. Not observed during surveys. No habitat present in study area.
Rhynchospora alba White beaked-rush	-/-/2B	Bogs and fens, meadows and seeps, freshwater marshes and swamps. July-August. Elevation: 60-2040m.	None. Not observed during surveys. Typical habitat not present in study area.

Scientific Name **Common Name**	**Status USFWS/ CDFW/ CNPS list**	**Habitat Affinities and Blooming Period/Life Form**	**Potential for Occurrence**
Rhynchospora californica California beaked-rush	-/-/1B	Bogs and fens, lower montane coniferous forest, meadows and seeps, freshwater marshes and swamps. May-July. Elevation: 45-1010m.	None. Not observed during surveys. Habitat not present in study area.
Rhynchospora capitellata Brownish beaked-rush	-/-/2B	Lower montane coniferous forest, meadows and seps, marshes and swamps, upper montane coniferous forest/mesic. July-August. Elevation: 45-2000m.	None. Not observed during surveys. Habitat not present in study area.
Rhynchospora globularis Round-headed beaked-rush	-/-/2B	Freshwater marshes and swamps. Blooms July to August. Elevation: 45-60m.	None. No habitat present in study area.
Trifolium amoenum Showy Rancheria clover	FE/-/1B	Coastal bluff scrub, valley and foothill grassland, sometimes on serpentinite. Blooms April to June. Elevation: 5-415m.	None. No habitat present in study area.
Trifolium hydrophilum Saline clover	-/-/1B	Marshes and swamps, valley and foothill grassland (mesic, alkaline), vernal pools. April-June. Elevation: 0-300m.	None. Not observed during surveys. Typical habitat not present in study area.
Viburnum ellipticum Oval-leaved viburnum	-/-/2B	Chaparral, cismontane woodland, lower montane coniferous forest. Blooms May to June. Elevation: 215-1400m.	None. Not observed during surveys. No habitat present in study area.
Usnea longissima Long-beard lichen	-/-/4	Broadleafed upland forest, North Coast coniferous forest on tree branches; usually on old growth hardwoods and conifers. Elevation: 50-1460m.	None. Suitable habitat not present on site. Not observed during surveys.
SPECIAL STATUS NATURAL COMMUNITIES			
Coastal and Valley Freshwater Marsh			None
Northern Hard Pan Vernal Pool			
Northern Vernal Pool			None

Rank 2B:	Plants rare and endangered in California but more common elsewhere
Rank 3:	Plants about which additional data are needed
Rank 4:	Plants of limited distribution.

Appendix C: Potentially Occurring Special Status Animal Species in the Project Area - 2018

Common Name Scientific Name	Status USFWS/ CDFW	Habitat Affinities and Reported Localities in the Project Area	Occurrence Potential
Invertebrates			
Blennosperma vernal pool andrenid bee *Andrena blennospermatis*	-/-	Bee is oligolectic (specialist pollinator) on vernal pool Blennosperma and nest in upland around vernal pools.	None: no suitable habitat.
Obscure bumblebee *Bombus calignosus*	-/-	Food plants include Baccharis, Circium, Lupinus, Lotus, Grindelia and Phacelia. Occurs in Coastal areas from northern Washington to southern California.	Low: plant species occur but habitat highly manipulated.
Western bumblebee *Bombus occidentalis*	-/-	Generalist foragers. They do not depend on any one flower type but they favor Melilotus, Cirsium, Trifolium, Centaurea, Chrysothamnus, Eriogonum. Historically from the Pacific coast to the Colorado Rocky Mountains; severe population decline west of the Sierra-Cascade Crest.	Low: plant species occur but habitat highly manipulated.
Giuliani's dubiraphian riffle beetle *Dubiraphia giulianii*	-/-	Inhabits exposed, wave-washed willow roots in the slow flows of the Russian River.	None: no suitable habitat.
California linderiella *Linderiella occidentalis*	-/-	Seasonal pools in unplowed grasslands with old alluvial soils underlain by hardpan or in sandstone depressions.	None: no suitable habitat.
California freshwater shrimp *Syncaris pacifica*	FE/SE	Endemic to Napa, Sonoma and Marin Counties. Occurs in low elevation and low gradient streams with moderate to heavy riparian cover.	None: no suitable habitat.
Fish			
Russian River tule perch *Hysterocarpus traskii pomo*	-/SSC	Occurs in low elevation streams of the Russian River. Requires clear, flowing water with abundant cover and deep (>1M) pool habitat.	None: no suitable habitat.
Navarro roach *Lavinia symmetricus navarroensis*	-/SSC	Habitat generalists, found in warm intermittent streams as well as cold, well-aerated streams.	None: no suitable habitat.
Coho salmon - Central California Coast ESU *Onchorhynchus kisutch*	FE/SE	Occurs from Punta Gorda, in northern California, to the San Lorenzo River, in Santa Cruz County, and includes coho salmon populations from several tributaries of San Francisco Bay (e.g., Corte Madera and Mill Valley Creek). Reported from Russian River (CNDDB 2018).	None: no suitable habitat.
steelhead - Central California Coast DPS *Onchorhynchus mykiss*	FT/SSC	Requires beds of loose, silt-free, coarse gravel for spawning. Also needs cover, cool water and sufficient dissolved oxygen. Species reported in Russian River (CNDDB 2018).	None: no suitable habitat.
Amphibians			
California tiger salamander *Ambystoma californiense*	FT /ST	Breeds in temporary or semi-permanent pools. Seeks cover in rodent burrows in grasslands and oak woodlands.	None: Outside species range.
California giant salamander *Dicamptodon ensatus*	-/SSC	Known from wet coastal forests near streams and seeps. Larvae found in cold, clear streams and adults known from wet forests under rocks and logs near streams and lakes. Reported 1 mi W of site in Porter Creek (CNDDB 2018).	None: no suitable habitat.

Common Name Scientific Name	Status USFWS/ CDFW	Habitat Affinities and Reported Localities in the Project Area	Occurrence Potential
foothill yellow-legged frog *Rana boylii*	-/ SPT	Inhabits permanent, flowing stream courses with a cobble substrate and a mixture of open canopy riparian vegetation. Species reported approximately 1 mile west from project site in Porter Creek (CNDDB 2018).	None: no suitable habitat in pond.
California red-legged frog *Rana draytonii*	FT/ SSC	Prefers semi-permanent and permanent stream pools, ponds and creeks with emergent and/or riparian vegetation. Occupies upland habitat especially during the wet winter months. Species reported more than 3 miles in distance from project site (CNDDB 2018).	**Low**: provides suitable habitat outside project area, but high predator load. None detected over past 4 years.
Red-bellied newt *Taricha rivularis*	-/SSC	Spends dry season underground within root channels. Requires rapid streams with temps between 15°C and 26° C and rocky substrate for breeding and egg-laying.	None: no suitable habitat.
Reptiles			
western pond turtle *Emys marmorata*	-/ SSC	Prefers permanent, slow-moving creeks, streams, ponds, rivers, marshes and irrigation ditches with basking sites and a vegetated shoreline. Requires upland sites for egg-laying. Species reported in Russian River (CNDDB 2018).	**High**: pond on site provides suitable habitat. None detected over past 4 years.
Birds			
Cooper's hawk *Accipiter cooperi*	MB/ SSC	Nests primarily in deciduous riparian forests. May also occupy dense canopied forests from gray pine-oak woodland to ponderosa pine. Forages in open woodlands.	None: no suitable habitat.
sharp-shined hawk *Accipiter striatus*	MB/ SSC	Dense canopy pine or mixed conifer forest and riparian habitats. Water within one mile required.	None: no suitable habitat.
Clark's grebe *Aechmophorus clarkii*	BCC	Breeds in colonies on large bodied freshwater lakes and marshes with emergent vegetation. Nest is built on floating plants or submerged snag, among emergent vegetation.	None: no suitable habitat. Would have been detected.
tricolored blackbird *Agelaius tricolor*	BCC/ SCE	Nests primarily in dense freshwater marshes with cattail or tules, but also known to nest in upland thistles. Forages in grasslands.	None: no suitable habitat. Would have been detected.
golden eagle *Aquila chrysaetos*	/ CFP	Forages in a variety of habitats including grasslands, chaparral and oak woodland supporting abundant mammals. Nests on cliffs and escarpments and tall trees.	None: no suitable habitat.
Great blue heron *Ardea herodius*	MB/ SSC	Nests colonially in large trees near water	None: no suitable habitat.
burrowing owl *Athene cunicularia hypugea*	BCC/ SSC	Nests in open, dry grasslands, deserts, prairies, farmland and scrublands with abundant active and abandoned mammal burrows. Prefers short grasses and moderate inclined hills.	None: no suitable habitat. Would have been detected.
Oak titmouse *Baeolophus inornatus*	BCC/ -	Breeds in cavities in oak woodlands, gleaning insects from the bark. Occurs from southern Oregon to northern Mexico along the Central Valley and xeric coastal foothills.	High: likely occurs on the site.
Wrentit *Chamaea fasciata*	BCC	Nests in coastal scrub and chaparral.	None: no suitable habitat. Would have been detected.

Common Name Scientific Name	Status USFWS/ CDFW	Habitat Affinities and Reported Localities in the Project Area	Occurrence Potential
white-tailed kite *Elanus leucurus*	MB/CFP	Inhabits low rolling foothills and valley margins with scattered oaks and river bottom- lands or marshes adjacent to deciduous woodlands. Prefers open grasslands, meadows and marshes for foraging close to isolated, dense-topped trees for nesting and perching.	None: would have been detected during field surveys.
common yellowthroat *Geothylpis trichas sinuosa*	BCC/SSC	Nests in fresh and salt marshes in tall grasses, tule patches and willows and forages in thick, continuous cover down to the water surface.	None: no suitable habitat. Would have been detected.
bald eagle *Haliaeetus leucocephalus*	BCC/CE, CFP	Nests in tall snags near water and forages on fish. This species winters near large bodies of waters with fish.	None: no suitable habitat. Would have been detected.
Lewis's woodpecker *Melanerpes lewis*	BCC/SSC	Found in open forest and woodland, often logged or burned, including oak, coniferous forest, riparian woodland, orchards, less often pinyon-juniper. Closely associated with open ponderosa pine forest in western North America. Most commonly uses pre-made or natural cavities. Wintering areas must provide storage sites for grain or mast.	Low: suitable habitat occurs on the site.
Song sparrow *Melospiza melodia*	BCC/-	Primarily breeds in riparian habitat or wetlands, or coastal scrub along the fog belt where the lack of standing or running water is compensated by moisture from fog.	None: no suitable habitat. Would have been detected.
Nuttall's woodpecker *Picoides nuttallii*	BCC/-	Found primarily in oak woodlands and riparian woods. Cavity nester.	High: likely occurs on the site.
Spotted towhee *Pipilo maculatus clementae*	BCC	Nests in shrubs and trees.	High: likely occurs on the site.
Osprey *Pandion haliaetus*	-/SSC	Nests in large trees within 15 miles of good fish-producing water body.	None: no suitable habitat.
black phoebe *Sayornis nigricans*	-/-	Nests in anthropogenic structures on ledges. Nest made of mud pellets, dry grasses, weed stems, plant fibers and hair.	**Observed on-site.**
rufous hummingbird *Selasphorus rufus*	BCC/-	Nests in chaparral, coniferous forest, scrub habitats and riparian habitats in Canada and winters in Mexico. Nests are placed on a downward drooping structure.	High: likely occurs on the site.
Allen's hummingbird *Selasphorus sasin*	BCC/-	Nests in wooded areas, meadows, or thickets along shaded streams, on a branch low down on stem, although placement height varies between 10 inches and 90 feet.	High: likely occurs on the site.
Mammals*			
Pallid bat *Antrozous pallidus*	-/SSC, WBWG:H	Day roosts in crevices and cavities in rock outcrops, mines, caves, buildings, bridges, properly-designed bat houses, as well as hollows and cavities in a wide variety of tree species. May roost alone, in small groups (2 to 20 bats), or in 100s in maternity roosts, with males and non-reproductive subadults in other, smaller roosts..	**High:** Suitable potential building habitat occurs on site.
Sonoma tree vole *Arborimus pomo*	-/SSC	North coast fog belt in Douglas fir, redwood and montane hardwood-conifer forests.	None: no suitable habitat occurs on the site.

Common Name Scientific Name	**Status USFWS/ CDFW**	**Habitat Affinities and Reported Localities in the Project Area**	**Occurrence Potential**
Townsend's big-eared bat *Corynorhinus townsendii townsendii*	-/CPE, WBWG:H	Day roosts in cave analogs; mines, buildings, bridges, sometimes large tree hollows. Particularly sensitive to roost disturbance, this species has declined throughout its range in California; very few maternity roosts are known in California. Switches roosts seasonally, sometimes within each season. Females form maternity colonies, males roost singly, and all disperse widely after maternity season. During winter, roosts in cold, but non-freezing roosts, which may include man-made structures. Forages in a variety of habitats, consistently in riparian and stream corridors, avoiding open habitat. May commute relatively long distances to forage.	**Medium**: Suitable potential building habitat occurs on site, but currently less suitable due to disturbance levels.
North American porcupine *Erethizon dorsatum*	-/-	Occurs in forests, mountains, chaparral, and sagebrush. During the winter porcupines eat evergreen needles and the inner bark of trees. During the spring and summer they eat flowers, berries, tender twigs, and leaves from deciduous plants.	None: no suitable habitat occurs on the site.
Western red bat *Lasiurus blossevillii*	-/SSC, WBWG:H	Solitary roosting, except when females are with young (from 2 to 6 are born). Roosts almost exclusively in foliage, under overhanging leaves, in woodland borders, rivers, agricultural areas including orchards, and urban areas with mature trees. Typically found in large cottonwoods, sycamores, walnuts and willows associated with riparian habitats. Forages over mature orchards, oak woodland, low elevation conifer forests, riparian corridors, non-native trees in urban and rural residential areas, and around strong lighting.	**Medium:** Suitable potential tree foliage occurs on site.
Hoary bat *Lasiurus cinereus*	-/-, WBWG:M	Roosts singly except when females are with young (from 2 to 4 are born) in dense foliage of medium to large coniferous and deciduous trees. Highly migratory, occurs from sea level to tree line in Sierra Nevada. Summer records predominantly male. Forages along stream and river corridors, open water bodies, meadows, and open forest above canopy.	**Medium:** Suitable potential tree foliage occurs on site.
California myotis *Myotis californicus*	-/-	Females give birth to one young. Typically roosts alone or in small groups in almost every habitat from desert to mountains, but most abundant at lower to mid-elevations. Roosts in crevices in rocks, slabs, hollow trees, exfoliating bark, buildings, mines. In trees may exhibit low roost fidelity, switching frequently. Emerges early in evening, forages along tree margins, canopy edge, over water, along trails and higher above ground in open habitat. Typically hibernates.	**Medium**: Potential to occur in trees and buildings.
Western small-footed myotis *Myotis ciliolabrum*	-/-, WBWG:M	Females give birth to one young, roosts singly or in small maternity groups in cliff and rock crevices, tree snags, buildings, concrete bridges and viaducts, caves and mines, occasionally under tree bark, swallow nests – males roost singly. Forages in early evening near rocks, bluffs, cliffs and tree margins, as well as water courses, and man-made water impoundments. Hibernates in small numbers.	**Low**: Potential to occur in buildings.

Common Name Scientific Name	Status USFWS/ CDFW	Habitat Affinities and Reported Localities in the Project Area	Occurrence Potential
Long-eared myotis *Myotis evotis*	-/-, WBWG:M	Reproductive females form small maternity colonies between 2-30 individuals; males and non-reproductive females roost singly or in small groups nearby. Found from coastal forests to high elevation, is absent from Central Valley and Sonoran and Colorado desert regions. May switch roosts frequently. Day roosts in hollow trees, under exfoliating bark, caves, mines, bridges, buildings and crevices in rock outcrops, under bark of small black oaks in northern California, also use mixed conifer forests throughout California. Nights roosts include bridges, caves. May hibernate.	**Medium**: Potential to occur in trees and buildings.
Fringed myotis *Myotis thysanodes*	-/-, WBWG:H	Roosts colonially, up to 2,000 individuals. Females form maternity roosts, give birth to one young. Found from coast to ca. 1,800 m in Sierra Nevadas, though most are known to the west of that range. Rare in all localities, data suggests serious population declines. Roosts in rock crevices, caves, mines, buildings and bridges, as well as tree hollows, particularly large conifer snags. Occurs in xeric woodland, hot desert-scrub, grassland, sage-grassland steppe, spruce-fir, mesic old growth forest, coniferous and deciduous/coniferous forests. Forages over secondary streams in fairly cluttered habitat, over meadows. May hibernate or use intermittent torpor.	Low: Potential to occur in buildings.
Long-legged Myotis *Myotis volans*	-/-, WBWG:H	Roosts colonially, females forming maternity colonies, giving birth to single young. Found throughout most of California from the coast to high elevation in Sierra Nevada and White Mountains, as well as mountains of Mojave Desert, central San Diego County, Coast Range, transverse ranges between Los Angeles basin and Central Valley. Roosts from sea level to ca. 3,000 m, in coniferous montane forests, occasionally riparian and desert habitats. Primarily uses trees, particularly large diameter conifers, under bark and in cavities, sometimes in abandoned buildings, mines, caves, cracks in the ground, and cliff/rock faces. Aerially forages in and around forest canopy. Hibernates in caves and mines.	Low: Potential to occur in buildings.
Yuma myotis *Myotis yumanensis*	-/-, WBWG:M	Forms often large maternity colonies, females giving birth to one young. Generally confined to lower elevations from sea level to up to 1,300 m in central Sierra Nevada and 2,000 m in southern Sierra Nevada. Males roost singly. Primarily a crevice roosting species in natural habitat, forms large maternity colonies in large spaces in man-made roosts, e.g. buildings. Also uses bridges, caves, mines, tree cavities, bat houses, abandoned swallow nests, exfoliating bark. Emerges early and forages almost exclusively over quiet water – ponds, pools, reservoirs, swimming pools. Appears to migrate, may hibernate in colder portions of their range.	**Observed on site: occupying barn and hop kiln in 2014.**

Common Name Scientific Name	Status USFWS/ CDFW	Habitat Affinities and Reported Localities in the Project Area	Occurrence Potential
Brazilian free-tailed bat *Tadarida brasiliensis*	-/-	Found in large to very large colonies (several hundred to millions), females giving birth to single young in maternity roosts. Found almost everywhere throughout California, from sea level up to about 3,700 m in some western mountain ranges, but mostly below about 2,000 m. Crevice and cavity dwellers, uses rock crevices, caves, mines, buildings, bridges, tunnels, bat houses, culverts, abandoned swallow nests. Forages from 6 m to thousands of meters above ground, often very large distances (<50 km) from day roost. Migrates in colder portions of range, or makes winter movements to Coast Range where it remains active or semi-active throughout winter, using torpor. Can remain active throughout winter in southern portion of state.	**Observed on site: occupying barn and hop kiln in 2014.**
American badger *Taxidea taxus*	-/SSC	Inhabits open grasslands, savannas and mountain meadows near timberline. Requires abundant burrowing mammals, their principal food source, and loose, friable soils.	None: no suitable habitat.

* Includes bat species expected to occur in the project region and vicinity based on known roosting ecology and habitat relationships, but not reported in the CNDDB.

Geotechnical Engineering Report Update
Ramey Winery
7097 Westside Road
Healdsburg, California

Project Number: 3053.01.06.1

The purpose of this letter is to update our previous geotechnical report for the project to current design standards. The results of our geotechnical study for the site were presented in our report dated January 27, 2014. On October 18, 2018, we performed a brief reconnaissance of the site and noted that the site surface conditions have not changed significantly since our report was issued.

Based on our review and reconnaissance, it is our opinion that the recommendations in our report are valid for design and construction of the improvements. We understand that some of the planned features may have shifted and that a new sound wall is being planned. We reviewed the architectural plans for the project that show a print date of September 21, 2018. Attached is the subject plan showing our subsurface exploration points.

With code changes, seismic design criteria can change. Current seismic design parameters are based on Section 1613 titled "Earthquake Loads" of the 2016 California Building Code (CBC). Based on Table 20.3-1 of American Society of Civil Engineers (ASCE) Standard 7-10, titled "Minimum Design Loads for Buildings and Other Structures" (2010), we confirmed that a Site Class of C should be used for the site. Using a site latitude and longitude of 38.5218°N and 122.8666°W, respectively, the design maps from the United States Geological Survey (USGS), and the website https://www.seismicmaps.org/, we determined that the seismic design criteria presented in our report are still valid for this project. We have represented them below.

2016 CBC Seismic Criteria

Spectral Response Parameter	Acceleration (g)
S_S (0.2 second period)	1.500
S_1 (1 second period)	0.600
S_{MS} (0.2 second period)	1.500
S_{M1} (1 second period)	0.780
S_{DS} (0.2 second period)	1.000
S_{D1} (1 second period)	0.520

We trust this provides the information you require at this time. If you have questions please call.

Very truly yours,

Subject: Wine Cave Feasibility
Ramey Wine Cellars
7097 Westside Road
Healdsburg, California

Dear Mr. Ramey:

As per your request, Condor Earth (Condor) reviewed a comment letter addressed to the Sonoma County Board of Supervisors prepared by Jane Nielson, dated August 7, 2018. Following is Condor's response to the referenced letter.

In January 2014 Condor prepared a report regarding wine cave technical feasibility (Condor Project No. 6692, dated January 17, 2014). Wine barrel storage caves are a common component of numerous wineries in Sonoma County, dating back to as early as the 1850's. Caves are advantageous for several reasons, most importantly for sustainability purposes: lower energy consumption, very long operational life, increased wine yield due to reduced evaporation, reduced construction materials compared to a surface buildings, and caves are non-flammable structures so are fire-safe. In addition, subterranean wine caves are not visible from the outside, so are advantageous for aesthetic purposes.

Our 2014 report included a description of the site and subsurface geologic conditions, based on our review of published literature, plus four on-site core borings and five test pits. The report includes a map (Figure 2) illustrating the boring and test pit locations, and an excerpt from a published geologic map of the area (Figure 3). A 3-dimensional (block) diagram is not necessary for us to understand the subsurface conditions.

Based on our investigation, Condor concludes that construction of the proposed wine cave is feasible. We understand the client has heeded our recommendations and plans to construct the entirety of the new wine barrel storage cave using cut-and-cover methods. Native ground materials excavated during construction of the caves will be used as backfill over the completed cave structure. We understand that the intent is to re-contour (raise) the ground surface above the caves and/or to otherwise disperse the excavated material on site to the extent possible, with the excess, if any, relocated to an appropriate site.

Wine cave and other project facilities geotechnical and engineering construction details will be provided as a part of the future Building Permit submittal.

Please contact Condor if you have any questions or if you require additional information.

Respectfully submitted,

CONDOR EARTH

RE: RAMEY WINERY, 7097 WESTSIDE ROAD, HEALDSBURG, CA
RESPONSE TO APPELLANTS' HYDROGEOLOGY COMMENTS
PRMD APPLICATION No. UPE14-0008
EBA JOB No. 16-2366

Dear Mr. Ramey:

This letter presents EBA Engineering's (EBA) response to the Maacama Watershed Alliance's appeal of the above referenced application, dated August 9, 2018. Page 8 of the appellants' comments includes:

Issue 3, Factor 2: "Draws water from the zone of influence of area wells. The EBA Engineering January 2017 report for the proposed project, with vineyard irrigation, the project will require about 5 million gallons of water annually, is clear that two of the five wells on the property serve neighboring properties to the west. Yet, there is no analysis of potential impacts to water delivered to these properties…"

EBA's January 2017 report lists five water supply wells located along the eastern margin of the property, wells #1 though #5. Two of these wells are identified as providing water to two neighboring property owners. Well #1 will exclusively provide water for the proposed on-site development, including the winery and tasting room. Well #2 supplies water to a single family dwelling for domestic use located on a neighboring property to the west (APN 110-240-039). Well #5 supplies water for vineyard irrigation to a separate neighboring property (APN 110-240-024).

The January 2017 report presents the following information:

- The subject water supply wells are completed in an alluvial aquifer associated with the Russian River, a Class 1 water area which is identified in the Sonoma County General Plan as a major groundwater basin.
- The Russian River is a managed water system that ensures perennial flow throughout the year and serves as a continuous source of recharge to the aquifer. This contribution, coupled with recharge from seasonal rainfall, minimizes the potential for depletion of the aquifer system.

L:\project\2366 Ramey Winery\08.13.2018 EBA.ltr.doc

- An 8-hour well capacity test performed on Well #1 demonstrated a sustainable yield of 45 gallons per minute (gpm) while inducing only 1.5 feet of drawdown and full recovery with one hour following cessation of pumping, indicative of a highly prolific aquifer system.

- The estimated radius of influence from the 8-hour, 45 gpm well capacity test is less than 160 feet from Well #1.

- The predicted maximum peak daily water demand for the proposed project equates to less than two hours of pumping at the demonstrated sustainable yield of 45 gpm.

- At the maximum peak daily water demand for the proposed project, the radius of influence of Well #1 is less than 100 feet.

- The closest neighboring property is more than 1,100 feet away from Well #1, therefore the projected radius of influence induced by pumping to supply the proposed project will not encroach onto neighboring off-site water supply wells.

- The proposed water use is projected to induce no measureable changes in surface water flows in the Russian River

EBA has estimated the distance between Well #1 and Well #2 to be approximately 100 feet; and the distance between Well #1 and Well #5 to be approximately 830 feet. Based on the estimated radius of influence of Well #1, which is less than 100 feet when pumping to meet the maximum peak daily water demand for the proposed project, we conclude that the drawdown in Well #2 will be de minimis. At approximately 830 feet distant from Well #1, Well #5 is also far enough away that the potential impact from Well #1 is de minimis.

Regrettably, we were only informed of the appellants' hydrogeology comments Friday evening and are not able to free our calendars in order to attend the Board of Supervisors hearing scheduled for Tuesday August, 14, 2018.

Sincerely,
EBA ENGINEERING

Ramey Winery Appeal Response to Traffic Issues

In response to information presented in Item 1, Public Safety, in the August 9, 2018 letter from the Maacama Watershed Alliance which references an attached letter by Hough Louch and Amy Jackson of Alta Planning + Design dated September 14, 2017, the issue raised regarding the adequacy of sight distance was further reviewed within the context of the applicable criteria, County standards, and field data.

Summary of Issue

Maacama Watershed Alliance identified sight distance as an issue needing specific review because there is a curve in the road north of the project's driveways that limits sight lines from the driveway on the west side of the roadway to the north. The comment letter characterizes the use of the criteria applied as downgrading road safety due to a misunderstanding of the various criteria and their uses.

Background

Sight distance criteria are provided in two references that are used by local jurisdictions in lieu of creating their own standards. One is the Caltrans *Highway Design Manual*, a reference used by all the cities in the County as well as all jurisdictions in nearby counties. The second is *A Policy on Geometric Design of Highways and Streets*, American Association of State Highway and Transportation Officials. While the County uses the AASHTO guidelines for sight distance in some conditions, the County uses the Caltrans manual where guidance regarding specific issues is not provided in the AASHTO manual, and it is noted that the County's Sight Distance Standard as contained in Drawing No. 812 (copy enclosed) refences the Caltrans *Highway Design Manual* as the source for the sight distance standards indicated.

Both references provide guidance for various categories of sight lines, including corner sight distance for intersections of public streets, passing sight distance, design sight distance, and safe stopping sight distance. Additionally, the AASHTO manual provides sight line recommendations for vehicles entering two-lane roadways from a side-street or other stop-controlled approach.

The *Sonoma County Guidelines for Traffic Impact Studies* (Guidelines) indicate that a project will have a significant impact if it constructs a new unsignalized intersection (including driveways) or adds traffic to an existing unsignalized intersection with inadequate sight distance according to AASHTO criteria. Because the project does not propose any new driveways, but rather, uses existing driveways, if applied literally, this policy excludes the project from sight distance analysis. However, because sight distance is a safety criterion, it was deemed prudent to evaluate it even though not strictly necessary under the County's criterion.

Appropriate Use of Criteria

The flexibility to apply the various types of sight distance criteria vary, depending on their purpose. The ones with the least flexibility are those that, if not met, would result in the most serious safety concern. An example of this is passing sight distance. Inadequate sight lines when passing could result in a head-on collision at high speed, likely leading to serious injuries or even fatalities. Similarly, stopping sight distance is used as the minimum

490 Mendocino Avenue, Suite 201 Santa Rosa, CA 95401 707.542.9500 **w-trans.com**
SANTA ROSA • OAKLAND • SAN JOSE

recommended sight distance for safe operation of intersections; lack of sufficient stopping sight distance could result in a broadside crash, which can in turn lead to serious injuries or worse.

The recommendations provided by AASHTO for vehicles entering from a side street as well as corner sight distance criteria are the most flexible because their basis is to provide a comfortable driving experience. These sight distance values are desirable to provide optimal conditions and allow a driver entering a street to do so without the approaching driver needing to alter their speed in any way and are specifically associated with entry to a highway according to the information in the AASHTO reference. These sight distance values are not, however, required or necessary to achieve safe operating conditions. As noted regarding corner sight distance in the Caltrans design manual, where corner sight distance cannot be achieved due to geometric or right-of-constraints, stopping sight distance is the minimum acceptable criterion.

While the County's guidelines for traffic impact studies do not specify what criterion should be applied, the County Road Standard as indicated on Drawing No. 812 clearly identifies application of stopping sight distance criteria for driveways and indicates how sight distance is to be measured for driveways intersecting County roads. As indicated on Drawing No. 812, stopping sight distance is to be measured from 10 feet back of the edge of pavement. Because this standard has been in place since June 2005, the application of stopping sight distance does not reflect a "downgrading" of County policy as is asserted in the appeal; this has been the County's direction for many years. The language provided in the original traffic study prepared by W-Trans reflects the conditions that are desirable, or achievement of sight distance that is adequate to allow vehicles to enter from a side street without causing oncoming traffic to alter their speed, but this is not the metric against which safety is measured.

Site Conditions

Approach Speed

To determine the minimum sight distance necessary at the site's driveways, it was first necessary to survey the speed of vehicles approaching the driveways at the point where drivers exit the curve and are first able to observe traffic in either of the driveways. As part of the initial analysis for this project a two-hour survey of southbound traffic was performed on February 11, 2015, a copy of which was provided in the traffic study dated March 10, 2016 (Page 51 of the 54-page file, copy enclosed for reference.). The speed profile for the 79 vehicles captured during this time is provided in this spreadsheet along with the cumulative speed curve indicating the speed at which the 85th, or critical, speed occurs.

In preparing for the appeal hearing a second speed survey was conducted, this time to capture northbound speeds at the curve to the south of the site's driveways (copy enclosed). Based on a two-hour survey performed on October 16, 2018, that captured 52 northbound vehicles, the critical speed was measured at 36 mph, though two vehicles were captured at speeds of 45 mph or more. However, sight lines were measure at about 400 feet, which is adequate stopping sight distance for approach speeds of more than 45 mph.

In the memorandum from Hugh Louch of Alta Planning + Design dated September 14, 2017, the adequacy of the speed survey is questioned, noting that the speed study should capture traffic over an entire hour or until a sample of 100 vehicles is obtained, whichever occurs first. As noted above, the surveys performed covered two-hour periods, so exceeded the minimum indicated. The speed surveys are more than adequate to meet the requirements indicated in the Alta memorandum, so are acceptable for application in the analysis without obtaining additional data.

Sight Distance Required

The threshold of significance applicable to the sight distance analysis is contained in the CEQA checklist, and it states that a project would have a significant impact if it, "Substantially increases hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)." There would only be a significant impact if drivers could not **stop** in time to avoid a collision with the entering vehicle; the applicable criterion for this condition is stopping sight distance.

As discussed in detail in the March 10, 2016, letter report, southbound drivers were found to be driving 35 mph when exiting the curve north of the project driveways. From that point they would need 250 feet of sight distance to the driveways so that, if a driver were already initiating a turn into Westside Road, the approaching driver would have adequate time to react to the entering vehicle and reduce their speed accordingly to allow the driver to complete their turn into Westside Road. Because this distance was not initially available at the driveway to the winery on the west side of the road, improvements are planned that will result in southbound drivers having a clear view of the driveways and a vehicle in either when they are at least 250 feet, as measured along the path of travel, from that vehicle. Similarly, the driver of a vehicle in a driveway will be able to see an oncoming vehicle when it has at least 250 feet to travel before arriving at the driveway location. While the appeal asks that the project not be approved until adequate sight lines have been achieved, this is not necessary. One of the conditions of approval is for the project to achieve at least 250 feet of stopping sight distance; this will be confirmed in the field prior to the project obtaining an occupancy permit, so the County can be assured this will be completed.

It is noted that sight lines as determined for the traffic study were measured at 15 feet from the edgeline. Under the County's standard as set forth in Drawing No. 812, the measurement can be taken at 10 feet from the edge of pavement. The shoulder in this area is only about one foot wide, so the measurements would be taken 4 feet closer to the road, resulting in increased sight distance compared to conditions from 15 feet from the edgeline. Upon completion of the planned improvements, sight lines as measured per the County's standard would be 275 feet, exceeding the minimum requirement of 250 feet indicated, which will be achieved when measured from 15 feet away from the edgeline. Minimum sight distance would therefore be available regardless of which measurement methodology were applied.

Similarly, sight lines to the south from both driveways and to the north from the east side of the roadway are already adequate to meet applicable stopping sight distance criteria. The available sight lines as measured from both 10 feet from the edge of pavement per the County's adopted standard and 15 feet from the edgeline per AASHTO guidance are summarized in Table 1. For the 36-mph critical approach speed for northbound traffic, approximately 260 feet of stopping sight distance would be needed. As shown, the available sight distance exceeds the minimum necessary in both directions from both driveways.

Table 1 – Sight Distance Summary (35-mph Design Speed)

Driveway ***Direction***	**15 Feet from Edgeline (AASHTO)**	**10 Feet from Edge of Pavement (County Standard)**
West side (winery)		
Looking North	*250*	*275*
Looking South	*300*	*305*
East side (tasting room)		
Looking North	*425*	*435*
Looking South	*390*	*400*

Conclusion

Because there will be adequate stopping sight distance for an approaching driver to safely avoid a collision with a vehicle moving into or out of the project driveways, including slower-moving trucks, the project driveways are expected to continue operating acceptably, as they have for decades, and the impact on safety is therefore less-than-significant.

Sincerely,

Subject: **Ramey Winery Project, Sonoma County, CA**
Response to Keith Kimberling Noise Comments

Dear Mr. Ramey:

Illingworth& Rodkin, Inc. has the following responses to the August 7, 2018 letter prepared for Appellants by Keith Kimberling of Vibro-Acoustics Consultants. That letter provided a critique of the noise studies we prepared for the Ramey Winery at 7097 Westside Road. Those noise studies referred to in the critique are our March 7, 2017 Environmental Noise Assessment ("Environmental Noise Assessment") and our August 16, 2017 Addendum to that Assessment ("The Addendum").

A. Overview of Our Response to the Kimberling Letter

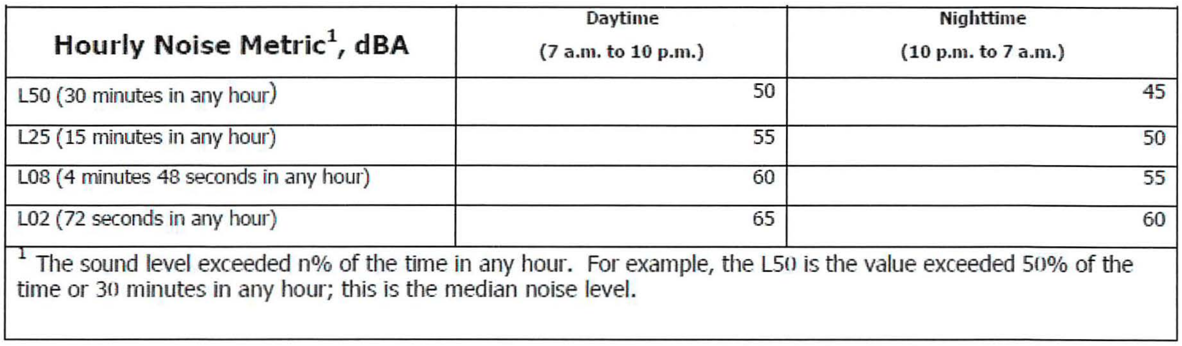
This letter addresses each of the issues that are raised in Mr. Kimberling's letter. First, many of the comments in his letter are based on a clear misreading of the noise standards set forth in the General Plan (see section B, below). This is a fundamental flaw running through several of the comments.

Second, there are a number of other flaws in Mr. Kimberling's comments, and these are demonstrated in the specific responses to each of his comments (see Section C, below). Among other things, the letter grossly over-estimates vehicle speeds, and thus noise levels, on a winery property, reflecting a lack of understanding of how wineries actually work. The letter also attacks the use of an acoustical center as a method of calculating noise effects, but the acoustical center method is used as a standard in noise evaluation courses, and is commonly applied in Sonoma County. Also, Mr. Kimberling's letter misunderstands and thus overstates the number of visitors at any one time expected at the proposed winery and also misunderstands several aspects of the proposed retaining wall.

Third, in evaluating the Environmental Noise Assessment and the Addendum along with Mr. Kimberling's comments and our responses, it is important to consider the substantial experience of Illingworth & Rodkin in evaluating noise impacts at wineries in Sonoma County. It is also important to consider that we coordinated and consulted with expert staff at the County Environmental Health Department in preparing the Environmental Noise Assessment and the Addendum. These points are covered in the concluding section of this letter (see Section D, below).

B. Application and Interpretation of General Plan 2020 Noise Standards

Many of the Kimberling comments are based on a fundamental misreading and misapplication of the noise level standards set forth in the Noise Element of the Sonoma County 2020 General Plan, and in particular Table NE-2 within that noise element. As set forth below, Table NE-2 sets forth a series of daytime and nighttime noise standards that apply within a certain range of durational exposure.



Hourly Noise Metric[1], dBA	Daytime (7 a.m. to 10 p.m.)	Nighttime (10 p.m. to 7 a.m.)
L50 (30 minutes in any hour)	50	45
L25 (15 minutes in any hour)	55	50
L08 (4 minutes 48 seconds in any hour)	60	55
L02 (72 seconds in any hour)	65	60

[1] The sound level exceeded n% of the time in any hour. For example, the L50 is the value exceeded 50% of the time or 30 minutes in any hour; this is the median noise level.

As the footnote to the table explains, the applicable noise standard is based on the "sound level exceeded n% of the time in any hour. For example, the L50 standard is the value exceeded 50% of the time or 30 minutes in any hour." This means that the L50 standard applies to noise that lasts between 30 minutes and a full hour. The Kimberling comments are predicated on a different and erroneous reading of the General Plan standards, however, as they assume that a particular standard applies for exposures *up to* the stated threshold, rather than exposures that *exceed* the stated threshold. This is shown, for example, in Kimberling's comment 3(c), when he states that the L02 metric "is to be used when noise level is exceeded for *less than* one minute and twelve seconds per hour." (emphasis added). Under the plain language of the General Plan, that standard applies when the noise level is exceeded for *more than* one minute and twelve seconds (but less than the next threshold, LO8, which is triggered at 4 minutes 48 seconds per hour – or 8% of the hour).

Our understanding of County Table NE-2 standards comes not only from a correct interpretation of the plain language of the General Plan but also from extensive experience with this standard in both the Current 2020 General Plan and the prior 1998 General Plan. A review of the prior General Plan shows that with the exception of the Category 5 maximum noise level standard (which was not carried over to the 2020 General Plan), the prior 1998 General Plan Table NE-2 standards (reproduced in Attachment A) are the same as in the current 2010 General Plan. The only changes being that 1998 Category numbers were replaced in 2020 with statistical descriptors, and the heading describing the cumulative duration of noise events per hour in each of the categories was removed. Thus, when the 2020 General Plan was adopted in 2008 Category 1 became the L50, Category 2 became the L25, Category 3 became the L08, and Category 4 became the L02. If Mr. Kimberling had the benefit of our experience long term experience with the implementation of General Plan Noise Standards within Sonoma County, he would clearly have not come to his incorrect interpretation of the Table NE-2 standards.

C. Response to Specific Comments in the Kimberling Letter

1. Kimberling Comment 1 - Noise Source Levels

Comment 1(a): The Environmental Noise Assessment states that the "maximum noise levels generated by heavy-duty (i.e., semi-tractor trailer type) trucks" would range from 70 dBA at constant speeds and 75 dBA when maneuvering and backing up, measured at 50 feet. We find these noise levels to be unrealistically low for heavy trucks and would expect levels around 75-85 dBA for heavy trucks at constant speeds and 80-85 dBA for heavy trucks maneuvering, when measured at 50 feet.

Response 1(a): Here, Mr. Kimberling clearly makes some incorrect assumptions about the speed of trucks on small winery access roads and loading areas at wineries. Considering measurement experience and Reference Energy Mean Emissions Level[1] modeling values, constant speed heavy truck sound levels of 75 to 85 dBA at 50 feet would be expected from heavy trucks traveling at between 20 and 55 mph, whereas the on-site trucks are expected to travel at 10 to possibly 15 mph. The heavy truck noise levels used in the Environmental Noise Assessment are based on measured and modeled levels of low speed truck operations at other commercial facilities I&R has used in a multitude of noise studies over the past 10 to 15 years. These same levels have been used for the evaluation of noise impacts the other winery projects within Sonoma County we have analyzed in this time period. Additionally, our definition of truck sizes and ratings are consistent with those defined by the Federal Highway Administration and used within Sonoma County (See Attachment B). Thus, Illingworth & Rodkin stands by its use of heavy truck noise levels at 50 feet of 70 dBA at constant speeds and 75 dBA when maneuvering and backing up.

Comment 1(b): Similarly, we find that the noise levels given for light vehicles of 53-63 dBA to also be unrealistically low. We would expect levels between 60 and 70 dBA for light vehicles measured at 50 feet, depending on the vehicle type and speed.

Response1(b): Again, Mr. Kimberling clearly makes some incorrect assumptions about the speed of light vehicles (autos and light trucks) traveling on small winery access roads and parking areas. Considering measurement experience and Reference Energy Mean Emissions Level modeling values, constant speed light vehicle sound levels of 60 to 70 dBA at 50 feet would be expected from vehicles traveling at between 25 and 45 mph, whereas on-site passenger vehicles would actually travel at speeds of 15 to 25 mph. The levels used for light vehicle noise levels in the Environmental Noise Assessment are based on measured and modeled levels of low speed auto and light truck operations and these same levels have been used for the evaluation of noise impacts for many other winery projects within Sonoma County. Thus, Illingworth & Rodkin stands by its use of auto and light truck levels at 50 feet of 53-63 dBA.

Comment 1(c): We found the stated noise levels for winery equipment and operations to be generally reasonable. For crush activities, it is important to note that the peak noise levels of 70-80 dBA measured at 50 feet should be used to assess noise impacts under worst-case conditions (during crush activities).

---

[1] Using California Vehicle Noise Reference Energy Mean Emissions Levels (REMELS).

Response 1(c): As noted in the Environmental Noise Assessment crush activities typically result in relatively constant noise levels from hoppers, presses, de-stemmers, separators, crushers, air compressors, forklifts, conveyors, etc. interspersed with discrete maximum noise events. During maximum crush operations both of these types of noise occur, and are already analyzed accordingly in the Environmental Noise Assessment.

Comment 1(d): For maintenance and forklift operations, we note that backup alarm noise is both tonal and "repetitive and irritating by design", as stated by Illingworth & Rodkin in the Environmental Noise Assessment. Therefore, noise limits applied to forklift noise should be reduced by five dBA according to exception number 2 of the Noise Element of the Sonoma General Plan.

Response 1(d): The 5 dBA tonal noise penalty has generally not been applied to forklift operations since while they are repetitive and irritating they are not continuous tonal sounds, are not composed of speech or music, and are not impulsive in nature, thus forklift backup alarms do not meet the requirements of NE-1C exception 2. Additionally, there is no statement in exception 2 that it should be applied to required safety equipment. Furthermore, it should be noted that even if the 5 dBA penalty were applied, the resulting sound levels would still be over 15 dBA below the adjusted County standards - so the use of the tonal penalty would not alter to findings of the Environmental Noise Assessment.

Comment 1(e): Table 4 of the Environmental Noise Assessment shows typical noise source levels for promotional events. While the stated values in this chart seem reasonable, the Environmental Noise Assessment does not specify how large the events from which these values were derived are in terms of number of people. This is troublesome because the table of proposed events at the Ramey Winery show four events per year where up to 300 people are expected to attend. (Environmental Noise Assessment Table 1) Clearly, the noise level coming from conversations at an event largely depends on the number of people at the event. For a 300-person event, we find that the value of 65 dBA measured at 50 feet for "Raised Conversation" stated in Table 4 is unrealistically low.

Response 1(e): It is our experience that noise resulting from raised conversation at a distance of 50 feet from winery and other social gatherings are generally around 65 dBA due to increasing distance from individual speakers. We have also found that for events with less than 150 to 175 guests the levels due to raised conversation at 50 feet are less than 65 dBA, however for the sake of conducting a conservative impact analysis, the 65 dBA at 50 feet levels were used for all event sizes. Additionally, we understand that while 300 person industry events are part of the project description, non-industry related (private) 300 person events are no longer part of the project. Based on experience with industry related winery events for such events are “rolling” type events were the number of guests equal to the total event attendance would visit the winery, but this number of guests would not be on site at the same time. Because of this the noise produced by rolling industry events at any one time would not be equivalent to Private events where the entire guest count would be on site at the same time. Thus, noise from 300 person industry events can be considered equivalent to small-to-medium sized events.

2. Kimberling Comment 2 - Residence 4

Comment 2: The March 7, 2017 does not address Residence 4 in its assessment of the noise impact of the proposed winery. Since Residence 4 is significantly closer to the proposed winery than the other three residences, conclusions based on the impact to the other three residences cannot be applied to Residence 4.

Response 2: The Noise Addendum, dated August 16, 2017, addresses the impacts from the proposed winery on Residence 4.

3. Kimberling Comment 3 - Traffic, Parking Lot and Truck Noise

(Noise Impact 1 in the August 2017 Noise Addendum)

Comment 3(a): Here, and in several other sections, Illingworth & Rodkin characterize a noise-producing area such as a parking lot as if all of the sound is emitted from the geometric center of the area. In this section, they state: "Based on review of the current site plans the acoustic center of the 12 regular parking stalls in this area will be 75 feet from the property line of Residence 4." This methodology is not commonly used in acoustics because even if a number of noise sources are distributed evenly across an area, they would not act the same way as a point source located in the center of the area producing the same total energy. This "acoustic center" model underestimates the distance of sound sources to the receptor, and thus underestimates the noise level at the receptor.

Response 3(a): Contrary to Mr. Kimberling's statements, the use of an equivalent acoustical center is an accepted and commonly used calculation method to model the overall impacts of dispersed outdoor environmental noise sources[2]. Additionally, in our analysis we did <u>not</u> "characterize a noise-producing area such as a parking lot as if all of the sound is emitted from the geometric center of the area" as stated by Mr. Kimberling, but instead considered parking lot noise from the "acoustic center" of the 12 regular parking stalls closest to the property line (see the plan view of acoustical center calculations in Attachment C). If we had considered parking lot noise from the true acoustic center of either just the regular parking spaces or all parking spaces (including overflow spaces) the distance to the property line would have been greater and the potential for noise impacts lower. Since the regular parking stalls closest to the entry drive and public entrance to the winery, which are furthest from the property line, would naturally be used more often than those further from the entrance, we find our approach to be a worst-case analysis of overall parking lot noise at the proposed winery in relation to Residence 4.

Comment 3(b): Illingworth & Rodkin state that automobile and light vehicle noise would be between 49 and 59 dBA at the property line of Residence 4. They state that "given the expected visitor and employee use, these activities are expected to occur for less than five minutes out of an hour on a typical day and fall in the L02 NE-2 daytime category of 65 dBA." The use of the L02 metric for activity that is "expected to occur for less than five minutes" is a misapplication of the Noise Element of the Sonoma General Plan. The L02 metric is to be used when the noise level is exceeded for less than one minute and twelve seconds per hour. For an activity which may occur for up to five minutes out of a typical hour, the correct metric is the L08, which gives a noise limit of 60 dBA according to table

---

[2] Hoover & Keith, 1996, *Noise Control for Buildings, Manufacturing Plants, Equipment and Products,* Lecture notes, first published 1981, Houston TX; Hoover & Keith, Inc. pp.6-21 to 6-23.

NE-2. The effect of this incorrect interpretation is that The Addendum uses a noise limit for light vehicle traffic which is 5 dBA higher than the actual limit, and the projected vehicle noise of 49-59 dBA falls barely within the correct daytime limit of 60 dBA.

Response 3(b): As stated above, this comment is based on a misreading and misapplication of the Sonoma County NE-2 standards. Per the clear text of the General Plan noise table, the L_{02} metric is applicable to noise levels which occur for 1 minute (and twelve seconds to be precise) per hour, up to the next level, or four minutes and 48 seconds per hour. Then, the L_{08} metric is applicable to noise levels which occur for 4 minutes 48 seconds per hour up to 15 minutes, the L_{25} metric is applicable to noise levels which occur for 15 minutes per hour up to 30 minutes, and the $L_{50\,\text{metric}}$ is applicable to noise levels which occur for 30 minutes or more per hour. It follows then that noise levels which occur for less than 1 minute (and 12 seconds) per hour are not regulated by NE-2 standards, noise levels which occur for more than 1 minute but less than 5 minutes per hour are regulated by the L_{02} NE-2 noise standard, noise levels which occur for more than 5 minutes but less than 15 minutes per hour are regulated by the L_{08} NE-2 noise standard, noise levels which occur for more than 15 minutes by less than 30 minutes per hour are regulated by the L_{25} NE-2 noise standard, and noise levels which occur for more than 30 minutes per hour are regulated by the L_{50} NE-2 noise standard. This understanding and interpretation of the County NE-2 noise standards has been confirmed by County Staff and used in numerous winery noise studies prepared by Illingworth & Rodkin. *It should also be noted that in two prior peer reviews of our winery studies by Vibro-Acoustic Consultants*[3]*, this correct interpretation of Table NE-2 standards was used and no comments were made by Vibro-Acoustic Consultants as the proper application of these standards.*

Comment 3(c): Furthermore, Illingworth & Rodkin state that "during events or on busy weekends, such activities may occur more frequently and fall in the L08 daytime category." It is reasonable to assume that this activity would last for longer than five minutes per hour during events and busy weekends. Therefore, the appropriate metric to be used is the L25 metric which gives a noise limit of 55 dBA. Again, this incorrect interpretation of the Noise Element of the Sonoma General Plan results in the use of a noise limit which is 5 dBA higher than the appropriate noise limit, and the projected vehicle noise of 49-59 dBA will exceed the correct daytime limit of 55 dBA.

Response 3(c): This comment is likewise based on a misreading and misapplication of the Sonoma County NE-2 standards. Maximum noise levels from light vehicle traffic during events or on busy weekends that are expected to last for longer than five minutes per hour but less than 15 minutes per hour would be properly regulated by the Sonoma County L_{08} NE-2 standard.

Comment 3(d): This incorrect interpretation of the Noise Element of the Sonoma General Plan is also applied to heavy truck noise. Illingworth & Rodkin state that "truck operations are expected to occur during daytime hours only and on a basis of one to five minutes per hour ... thus, truck operations would fall into the L02 NE-2 category of 65 dBA." The

---

[3] These were review letters of Illingworth & Rodkin's Environmental Noise Assessment of the proposed Hunt Ryd Winery (VACC letter dated 10 December 2014) and our Environmental Noise Assessment of the Hop Kiln Winery (VACC letter dated 6 March 2015).

correct metric to be used is the L08 metric of 60 dBA. This incorrect interpretation results in the use of a noise limit which is 5 dBA higher than the appropriate noise limit when applied to heavy truck noise, and the projected truck noise of 65-70 dBA will exceed the correct daytime limit of 60 dBA.

Response 3(d): This comment is likewise based on a misreading and misapplication of the Sonoma County NE-2 standards. Truck operations which occur during daytime hours only and on a basis of one to five minutes per hour would be properly governed by the Sonoma County L_{02} NE-2 standard.

Comment 3(e): Based on the incorrect noise limits, The Addendum notes that heavy truck noise would be 5 dB above the limit. The mitigation measure proposed is to extend a 6-foot retaining wall and to use the extension as a 6-foot sound barrier. Based on the correct noise limit, this barrier wall would need to provide a minimum of 10 dB of attenuation. There is no evidence presented in The Addendum as to how the barrier would provide this attenuation.

Response 3(e): This comment is irrelevant because the use of the Sonoma County L_{02} NE-2 standard is correctly applied in the Environmental Noise Assessment and the Addendum. Thus, a 6-foot high noise barrier only needs to provide a 5-dB noise reduction, not a 10-dB reduction as implied by the comment. Our calculations (see Attachment D) indicate that the proposed 6-foot retaining wall extension barrier in the Addendum would achieve the more than the needed 5-dB reduction. The location of the proposed retaining wall extension and stand-alone barrier and an illustration of the ability of the 6-foot high retaining wall extension to block the line-of-sight to trucks, and thus noise, from winery trucks is shown in Addendum Figure 2 (see Attachment E).

Comment 3(f): The predicted noise level at the property line due to heavy truck noise is also based on questionably low source levels, as noted earlier in this report. This means that the 6-foot barrier wall proposed as a mitigation measure would likely need to provide significantly more than 10 dB of attenuation to heavy truck noise. We could not analyze the effectiveness of a 6-foot wall as a sound barrier in this situation because there was very little detail in The Addendum as to the location of the proposed wall.

Response 3(f): Refer to response 1a. This comment is irrelevant considering that the heavy truck noise levels used in the Environmental Noise Assessment analysis are correct. Additionally Figure 2 in the Addendum (see Attachment E) clearly calls out the 6 foot high wall as extending 100 feet in-line with the retaining wall, and the text states that the height should be measured above the existing ground level and specifies the acceptable solidity and surface weight of the wall. Such specification is sufficient to analyze the effectiveness of the sound barrier.

4. Kimberling Comment 4 - Mechanical Equipment Noise

Comment 4: The problem in this section is that the structural attenuation of the mechanical room walls was essentially double-counted. Originally, the mechanical room was planned to be a semi-open area. As a mitigation measure, Illingworth & Rodkin proposed that the mechanical room have solid walls on the southern side, between the equipment and

Residence 4. The issue is that the predicted noise levels at the property line were reduced based on 6 dB of structural attenuation due to the semi-open mechanical room. Since the mitigation measure is to change the walls of this room from semi-open to solid, this 6 dB of attenuation cannot be added onto whatever level of attenuation the solid walls are expected to provide. This means that the solid walls need to provide 6 dB more attenuation in addition to the 23-28 dB. The solid walls between the mechanical room and Residence 4 would need to provide 34 dB of attenuation in order to ensure that noise from the mechanical room measured at the property line of Residence 4 does not exceed Sonoma County noise limits. The Addendum did not specify how much attenuation the solid wall would need to provide.

Response 4: The analysis of the Addendum's mechanical noise mitigation measure did not double-count the structural attenuation of the mechanical room walls. While the commenter is correct that we also did not specify the attenuation of the solid wall, and the details of the solid wall to be used are not available, any typical non-glazed (i.e. solid) wood or steel framed wall with exterior siding and interior plywood or gypsum board facing is typically capable of attenuating interior to exterior by 35 dBA or more. Attachment F shows the typical sound isolation ratings provided by such solid walls as extracted from the Catalog of STC and IIC Ratings for the Wall and Floor/Ceiling Assemblies published by the California Office of Noise Control for example wood and steel framed walls with gypsum board on each stud face. While not directly equivalent, the STC rating of a wall roughly equals the decibel (dBA) noise reduction from one side of a wall to the other. It can be noted that the use of any siding materials over exterior gypsum sheathing would increase the sound isolation rating of the wall). Thus, the sound reduction of a given wall rated at STC-37 equals 37 dBA ±1 to 2 dBA. So, it clearly follows that use of solid mechanical room walls would reduce the sound level from the interior to the exterior of the mechanical room by 35 dBA or more. Thus, special sound rated construction was not needed and specifying the walls as solid was considered sufficient for the project.

5. Kimberling Comment 5 - Crush-Related Noise

Comment 5(a): As with the first impact/mitigation section, Illingworth & Rodkin make the assumption that sound coming from multiple sources in an area acts like a single point source in the center of the area producing the same sound levels. We reiterate that this is not a reasonable assumption to make and is not common practice in acoustics.

Response 5(a): Again, contrary to the review statements, the use of an acoustic center is an accepted and commonly used calculation method to model the overall impacts of dispersed outdoor environmental noise sources and I&R has used this approach in many analysis' of winery noise impacts in the past.

Comment 5(b): According to the predicted noise levels in The Addendum, the noise from the bottling area measured at the property line would exceed the daytime noise limit by 3 dB and the nighttime limit by 6 dB. The mitigation measure proposed is to use the same 6-foot retaining wall extension described in the first impact/mitigation section as a sound barrier for the bottling noise. As with the first section, Illingworth & Rodkin do not provide any evidence of the efficacy of this wall in providing the needed attenuation.

Response 5(b): As discussed in Response 3(e), the top of the 6-foot high retailing wall extension and 6-foot high ground level wall extension would also break the line of sight from bottling operations to the property line and thus also reduce bottling noise levels. As discussed in Response 3(e), this noise level reduction would be more than 3 dB allowing the County NE-2 standards to be met.

6. Kimberling Comment 6 - Maintenance and Forklift Noise

Comment 6(a): In this section, the L08 metric is used as the noise limit for forklift and maintenance operations. There is no justification given for why this metric was chosen, and it is not reasonable to assume that maintenance and forklift noise would only occur for less than five minutes in a typical hour.

Response 6(a): This comment is likewise based on a misreading and misapplication of the Sonoma County NE-2 standards. Maximum noise levels from forklift and maintenance operations are reasonably assumed to occur for more than 5 minutes but less than 15 minutes per hour and are thus regulated by the Sonoma County L_{08} NE-2 standard.

Comment 6(b): Once again, Illingworth & Rodkin make the questionable assumption that sound coming from multiple sources in an area acts like a single point source in the center of the area producing the same sound levels.

Response 6(b): See responses 3a and 5a. Again, the use of the acoustic center of multiple, dispersed noise sources is an accepted and commonly used calculation method to model the overall impacts of outdoor environmental noise sources and I&R has used this approach in many analysis' of winery noise impacts in the past.

Comment 6(c): As mentioned in our analysis of the March 7 Environmental Noise Assessment, forklift backup alarms are tonal and annoying by design, and would be subject to a reduction of the noise limit by 5 dB, per exception 2 of the Noise Element of the Sonoma General Plan. This is not addressed in The Addendum.

Response 6(c): Forklift noise was addressed in our Addendum. As discussed in Response 1d forklift backup alarms do not meet the requirements of NE-1C exception 2. Additionally, even if a 5 dBA penalty were applied, the additional noise reduction supplied by the 6-foot high retaining wall extension and 6-foot high ground level wall extension would provide the additional 5 dBA of noise reduction needed to reduce noise levels from the worst case conditions with outdoor forklift and maintenance operations in the truck loading area. See calculations in Attachment D.

Comment 6(d): In the calculations for the predicted forklift/maintenance noise levels at the property line, Illingworth & Rodkin state that the 6-foot retaining wall extension would provide 6 dB of attenuation. This attenuation level of 6 dB is not mentioned in any of the other sections where the retaining wall and/or the extension of the retaining wall were discussed, and no evidence is provided to support the claim that this wall would provide 6 dB of attenuation.

Response 6(d): This comment is addressed in Response 6(c), above.

Comment 6(e): The predicted forklift/maintenance noise level measured at the property line is exactly at the L08 daytime limit of 60 dB. Considering that questionable assumptions were made, the fact that the 60 dB L08 limit is used without justification, and the fact that the predicted noise level is exactly at the limit, we are not convinced by the claim that no mitigation is needed for forklift/maintenance noise.

Response 6(e): Based on calculations shown in Appendix A, the level will likely be lower than 60 dBA. The 60 dBA level was just reported in the Addendum to confirm that this source would not exceed County Standards.

7. **Kimberling Comment 7 – Event Noise**

Comment 7(a): The noise source levels used in this section are based on Table 4 of the Environmental Noise Assessment, which provides typical noise source levels for promotional events. While these levels seem reasonable for small-to-medium sized events, they do not address the four 300-person events per year planned at the winery, which will inevitably produce a higher noise level.

Response 7(a): In general, we have found that the noise source levels used in this section are based on Table 4 of the Environmental Noise Assessment are also applicable to larger winery events. It terms of the noted 300-person events as in Response 1e, because non-industry 300-person events are no longer part of the project the noise produced by rolling industry events at any one tome would not be equivalent to Private events where the entire guest count would be on site at the same time and thus noise from 300 person industry events can be considered equivalent to small-to-medium sized events.

Comment 7(b): The noise impact of the automobile traffic due to a 300-person event is also not addressed. While impact/mitigation section 1 does mention "events and busy weekends," it uses the L08 metric for these "busy" times. We noted earlier that the L25 metric would be more appropriate, since *it* is not reasonable to assume that traffic noise during "busy" times would only be present for less than five minutes in a typical hour. For 300-person events, we believe that the L50 is the only appropriate metric, since the traffic noise of 300 people showing up to an event cannot reasonably be expected to last for less than 15 minutes in an hour. Using the L50 metric, the predicted automobile and light vehicle noise levels at the property line would exceed the noise limit by up to 9 dB, based on the light vehicle noise levels used by Illingworth & Rodkin. We also note that these light vehicle noise levels of 49 to 59 dB measured at the property line (75 feet from the parking lot) are questionably low, especially for the number of vehicles expected for such a large event.

Response 7(b): The L_{08} metric, which governs maximum noise levels from light vehicle traffic which lasts longer than five minutes per hour but less than 15 minutes per hour is appropriate for these "busy" times.

Comment 7(c): The mitigation measures proposed in this section address amplified speech, amplified music, and non-amplified music, and are as follows:

1) "Indoor events with amplifies speech or non-amplifies music should only occur within the baling barn or tasting room buildings with closed windows and doors."

2) "Amplified music within the baling barn or tasting room should be maintained at normal, not peak amplification levels, such that the L50 level of the amplified music not exceed 72 dBA at a distance of 50 feet."

These two mitigation measures do not address the heightened automobile and light vehicle noise likely to occur during the large events.

Response 7(c): Parking and vehicular noise impacts are addressed separately from event impacts because they do not generally occur at the same time - event noise occurs after the guests arrive and before they leave and thus the impacts are not additive. However, when the winery holds a "rolling" event, with the number of guests equal to the total attendance and with people coming and going at different times, the number of guests in attendance while traffic from others arriving or leaving would be lower. Thus, any additive noise from event and traffic activities would not be expected to result in a noise impact.

D. Illingworth & Rodkin Experience; Consultation with County Experts

Two other points should be considered in evaluating the Illingworth & Rodkin noise reports, the Kimberling comments and these responses. The first point is the substantial experience and expertise of the Illingworth & Rodkin experts in noise assessments of wineries in Sonoma County. The second point is the Illingworth & Rodkin's consultation with the County in the preparation of the noise reports.

On the first point, Illingworth & Rodkin has prepared noise evaluations related to 89 wineries in Sonoma County, and as a result has substantial experience working with County staff and applying County noise standards. A list of wineries in Sonoma County for which Illingworth & Rodkin has evaluated noise issues is attached to this letter (Attachment G).

I hold degrees in both architecture and engineering and have 23 years of experience in acoustical matters. My resume is attached (Attachment I) to this letter as is an overall a description of our firm (Attachment H). The other engineer that worked on this project, Carrie Janello, has two degrees in mechanical engineering and 14 years of work experience in the field. Her resume is also attached to this letter (Attachment J). We both have experience in evaluating noise related to wineries. Between us, we have evaluated noise related to at least 34 wineries in Sonoma County alone.

On the second point, during the analysis and development of the Environmental Noise Assessment and supplemental Addendum Reports, Illingworth & Rodkin consulted with Becky Vermeer at County Environmental Health and County Planning Staff to ensure that the noise criteria and impact analysis met with accepted County Standards.

This concludes Illingworth& Rodkin's responses to the Mr. Kimberling's comments on our Environmental Noise Assessment, and Noise Addendum of the Ramey Winery at 7097 Westside Road from Vibro-Acoustics Consultants dated August 7, 2018.

Sincerely yours,

Fred M. Svinth, INCE, Assoc., AIA
Senior Consultant, Principal
Illingworth & Rodkin, Inc.

Attachment A: Prior (1998) General Plan NE-2 Standards

3.0 NOISE ISSUES, POLICIES AND STANDARDS

3.1 LAND USE COMPATIBILITY AND PROJECT REVIEW

Noise level performance standards in Table NE-2 below are to be applied as performance standards for noise producing land uses which may affect noise sensitive land uses and vice versa.

Infrequent single events such as passage of a train, truck, or airplane may interfere with adjacent uses even though the cumulative noise exposure is within acceptable limits. These events call for a single event noise standard. The potential for sleep disturbance is often the main concern in these cases.

GOAL NE-1: Protect people from the harmful effects of exposure to excessive noise and to achieve an environment in which people and land uses may function without impairment from noise.

Objective NE-1.1: Provide noise exposure information so that noise impacts may be effectively evaluated in land use planning and project review.

Table NE-2 Noise Level Performance Standards

	Maximum Exterior Noise Level Standards, dBA		
Category	Cumulative Duration of Noise Event in any one-hour period	Daytime 7 a.m. to 10 p.m.	Nighttime 10 p.m. to 7 a.m.
1	30-60 Minutes	50	45
2	15-30 "	55	50
3	5-15 "	60	55
4	1-5 "	65	60
5	0-1 "	70	65

Objective NE-1.2: Develop and implement measures to avoid exposure of people to excessive noise levels.

Objective NE-1.3: Protect the present noise environment and prevent intrusion of new noise sources which would substantially alter the noise environment.

Objective NE-1.4: Mitigate noise from recreational and tourist serving uses.

Attachment B: Sonoma County Truck Sizes

SONOMA

County of Sonoma
Permit & Resource Management Department

MEMO

DATE: **August 22, 2017**

TO: **Traci Tesconi, Supervising Planner**

FROM: **Becky VerMeer, Environmental Health Specialist-Project Review**

SUBJECT: **Truck Sizes as defined by the Transportation's Federal Highway Administration**

Trucks as defined by (empty) weight in categories of Light, Medium and Heavy and by the Dept. of Transportation's Federal Highway Administration (FHWA) classifications:

Light Trucks: Passenger cars and small trucks

Up to 14,000 lbs

FHWA classes 1-3

5 lug wheel hub (depending on the year of the vehicle, more hubs =heavier duty suspension and load capacity)

Medium Trucks: Box truck, Van, Flatbed truck, Fire truck (may be Heavy Trucks too), RV, Ford F-650 Medium Duty, Delivery truck, Cutaway van chassis, Bottler

14,001 lbs -26,000 lbs.

FHWA classes 4-6

6-8 lug wheel hubs

Heavy Trucks:

26,001- 33,000 lbs. Garbage trucks, Dump trucks, Tank Truck, Tractor Unit, Mobile Crane, Cement Mixer Truck, Ford F-750, Semi trucks, 18 wheelers,

FHWA classes 7-8

Requires a Class B Commercial Driver's License for non-combo vehicles or Class A Commercial Driver License for combo vehicles (tractor-trailers)

Typically have 3 or more axles

Super Heavy Trucks:

- 33,000 lbs+
- Requires escorts and special permits for Highway use
- Usually for Off Highway vocations like logging, mining, etc.

ILLINGWORTH & RODKIN, INC. (I&R) FIRM DESCRIPTION AND PROFESSIONAL SERVICES

Illingworth & Rodkin, Inc. was founded in 1987 and provides a complete range of consulting services in acoustics, hydroacoustics, vibration, and air quality (including greenhouse gases) to governmental agencies, private sector clients, and other environmental and design professionals. We have completed over 5,000 projects over 30 years in architectural acoustics, community noise and vibration, industrial noise and vibration control, hydroacoustics, tire/pavement noise research, transportation noise, and air quality/GHG studies. Our goal is to provide our clients with the benefit of our expertise and experience with an emphasis on objective and thorough analyses of issues, timeliness, teamwork, and practical solutions. I&R's main office is located in Petaluma, CA, with satellite offices in Marysville, CA, Denver, CO, and Ridgefield, WA, and is Colorado ESB certified. Our services include:

Environmental Studies
- Noise and air quality assessments for environmental studies (EIR, IS, EIS, EA)
- Noise and air quality technical studies for transportation projects
- Noise studies for new residential developments
- Underwater noise (hydroacoustic) monitoring and analysis
- Tire/pavement noise research
- Community noise control plans and ordinances
- Noise Ordinance compliance
- Air quality conformity determinations

Architectural Acoustics
- Designs for interiors
- Control of noise transmission between spaces
- Sound Isolation and Room Reverberation Testing
- Isolation from exterior noise
- Code compliance

Noise Control Engineering
- Designs and specifications for mechanical and electrical equipment
- Solutions for existing noise and vibration problems in buildings and industry

Computer Modeling
- Traffic noise using TNM, SOUND32 and LEQV2
- Noise sources using SoundPLAN and ENM
- Air Pollutant emissions estimation using URBEMIS, CalEEMod, EMFAC, OFFROAD, MOVES, AP-42
- Microscale air quality traffic modeling using CALINE4, CAL3QHC
- Stationary air pollution source modeling using EPA-approved models (e.g., ISCST, AERMOD)

Field Monitoring
- Environmental noise and vibration
- Sound isolation, impact insulation and reverberation time in buildings
- Mechanical and electrical equipment noise and vibration
- Noise from industrial plants
- Meteorological conditions
- Aerometrics and Air toxics

Expert Testimony
- Lawsuits
- Presentations to government bodies

FREDERICK M. SVINTH, INCE, Assoc. AIA

Mr. Svinth holds degrees in both architecture and engineering. With this background he has focused his professional interests and experience in room acoustics and the control of noise and vibration within the built environment. In addition to experience working as a power plant field engineer and an architectural designer, he has over 23 years of experience consulting in the U.S. and internationally on various aspects of acoustics and vibration. He has consulted on a large number of projects for public, private and government clients, ranging from the study of environmental noise and vibration related to land-use compatibility to acoustic design within and without all types of residential structures, entertainment venues, religious facilities, and industrial buildings.

Mr. Svinth's unique educational background and professional experience in architecture and engineering enables the firm to develop complete solutions for projects with acoustic and vibration requirements. Fred's focus and technical specialties are involved in architectural acoustics and encompass the design and detailing of all types of new and renovated buildings, the control of noise and vibration for mechanical systems, transportation facilities, and entertainment venues within the built environment, conventional and alternative energy power generation noise control, and noise & land-use compatibility planning.

Mr. Svinth's skills include freehand and computer aided drafting (AutoCAD), heliport and airport noise modeling (HNM & INM), and the use of commercial and in-house software tools for architectural acoustics design and the development of noise control treatment options.

PROFESSIONAL EXPERIENCE

2009 to Present: Principal & Sr. Consultant January 2000 to 2009: Senior Consultant & Sept. 1990 to Aug. 1992: Staff Consultant	Illingworth & Rodkin, Inc. Petaluma, California
August. 1997 to January 2000 Senior Acoustical Consultant	Jack Evans & Associates, Inc. Austin, Texas
August 1996 to August 1997 Architectural Designer/Project Manager	Chiles Architects, Inc. Austin, Texas
March 1996 to August 1996 Architectural Designer	Madison Graham Architects, Inc. Austin, Texas

CARRIE J. JANELLO

Ms. Janello joined at Illingworth & Rodkin as a consultant in 2008. Since then, she has applied her expertise to projects related to highway tire/pavement and environmental noise impact assessment. Her highway related work has included acquiring and analyzing tire/pavement noise using the on-board sound intensity (OBSI) technique for both the California Department of Transportation (Caltrans) and the Arizona Department of Transportation (ADOT). Specific Caltrans projects include the on-going performance evaluation of test pavements on the LA 138 and the PCC texture pavements study on the SR 58 Mojave Bypass utilizing the sound intensity technique. For her work with ADOT, Ms. Janello has been involved in OBSI and wayside measurements contributing to the Quiet Pavement Pilot Project. She also contributed to three recent research projects completed for the National Cooperative Highway Research Program. Ms. Janello has also completed a variety of environmental noise impact assessment projects in Northern California that have included wineries, car washes, and highway expansion.

Ms. Janello earned her BS and MS degrees in Mechanical Engineering from the Ohio State University in 2004 and 2005, respectively. The focus of her studies and education in graduate school included acoustics, vibrations, digital signal processing, systems dynamics, and overall automotive noise, vibration, and harshness (NVH). In conjunction with Dr. Crowther and Dr. Singh from Ohio State, Ms. Janello's research was published in the *Journal of Sound and Vibration* in 2007.

Ms. Janello has also worked for Ford Motor Company in the Powertrain NVH department where she developed procedures for measuring and quantifying "unique" NVH issues, determined target level thresholds for qualifying customer satisfaction, and contributed to overall sound packaging improvements for production vehicles.

Response to Caltrans Comments on the "Traffic Study for the Ramey Winery"

Dear Mr. Ramey;

We are in receipt of comments from Caltrans on the traffic analysis prepared for the Ramey Winery project (UPE14-0008) as contained in a letter dated September 14, 2017 to Ms. Traci Tesconi from Ms. Patricia Maurice. As requested by Ms. Tesconi, the following information is provided in response to these comments. The Caltrans headings are provided along with a summary of comment for ease of review.

Operations Analysis

Caltrans indicated a concern about conflicts at the Westside Road interchange with US 101, and requests a traffic study that includes the trip generation and distribution. This information is available in the March 10, 2016, traffic study prepared for the project. Because the project generates fewer than 20 peak hour trips, analysis would only be required if the project affects a State facility that operates at LOS E or F. The section of US 101 north of Windsor is expected to operate acceptably under long-term future volumes in its current configuration according to the *Sonoma County GP 2020 Draft EIR*, therefore analysis of the project's potential impacts on this segment of the freeway is not warranted.

Travel Demand Analysis

Caltrans recommended that a VMT analysis be provided. However, the County has not yet established guidance for preparing a VMT analysis, nor have standards been adopted against which findings could be measured. Further, the guidance provided by the Office of Planning and Research is insufficient to address the trips generated by a winery. It is therefore premature to prepare a VMT analysis. It is noted that the potential safety issues as well as adequacy of facilities for pedestrians and bicyclists are addressed in the traffic study, as discussed in the final two bullets of this section of the comment letter.

Vehicle Trip Reduction

While the project is of insufficient size to establish a robust program for managing transportation demand, the applicant will be providing bicycle parking, which is one of the potential trip-reducing measures. Given the rural nature of the project and limited number of employees, implementation of any of the other typical Transportation Demand Management measures is infeasible.

Multimodal Planning

The project will have a driveway on Westside Road, which provides a connection to the proposed Class III bike route. No additional facilities are planned or proposed.

ATTACHMENT P

Traffic Impact Fees

The County has an established fee to mitigate traffic impacts by private development that it is assumed will be collected from the applicant.

Transportation Permit

Should there be a need for an oversized or excessive load vehicle to travel to the site, the appropriate permit will be required of the shipper.

We hope this information is adequate to address the Caltrans comments. Please feel free to contact me if there are any questions regarding this information or our conclusions. Thank you for giving us the opportunity to provide these services.

Sincerely,

Dalene J Whitlock

Dear Traci,   10-16-2014

On behalf of the members of the Sonoma County Bicycle and Pedestrian Advisory Committee (SCBPAC), thank you for the opportunity to review the proposed winery and public tasting room to be located at 7097 Westside Road in Healdsburg, project # UPE14-0008. Please accept the following comments on behalf of the SCBPAC.

As a condition of project approval, please require the installation of adequate bicycle racks near the entrance to the proposed public tasting rooms. Please reference the bicycle parking standards provided on pages 19 and 20 of the 2010 Sonoma County Bicycle and Pedestrian Plan, which can be found via the following link; http://www.sonoma-county.org/prmd/docs/misc/bikeplandraft.pdf. Additional bicycle parking guidelines are also provided by the Association of Pedestrian and Bicycle Professionals (APBP), which can be found online at the following website; http://www.apbp.org/resource/resmgr/publications/bicycle_parking_guidelines.pdf. Please note that the SCBPAC recommends the installation of inverted-U style bicycle racks.

Thanks again for the opportunity to comment on this project. I can be reached at 585-7516 should you have any questions.

Sincerely,

Steven Schmitz
SCBPAC Staff

Subject: 7097 Westside Rd

Follow Up Flag: Follow up
Flag Status: Flagged

I am in full support of people developing their land and using as they chose, and welcome this development of a historic building. However from a safety standpoint: I Strongly object to any events where there might be stopped cars on the road: THERE CAN BE NO BACK UP, OR STOPPED CARS ON WESTSIDE. The access point sits between multiple sharp curves with no visibility in either direction for stopped cars. Additionally the new law regarding passing a bicycle of 3' makes all (except for 2 short sections of dotted yellow) illegal , one must pass within 3' or cross the double yellow, both illegal.

While writing this I spoke with Claire Ramey, who seems to understand my concerns .

Best,

--

To:	Traci Tesconi; Shirlee Zane; Lynda Hopkins; James Gore
Cc:	fsonoma@sbcglobal.net; dawn darien
Subject:	Support Ramey Winery Use Permit
Importance:	High

Dear Ms. Tesconi, and Supervisors Gore, Hopkins, Zane, Rabbit and Gorin-

I am writing you in support of the Ramey Winery use permit approval, and to deny this appeal.

Twenty years ago, I worked with the first Board of Directors, and helped organize and formulate the Russian River Valley Winegrowers, whose membership includes growers and wineries. AVA groups like the RRVW require good stewards of the land, responsible viticulture leaders and wineries that can provide extraordinary brands, honest neighborhood respect and strong consumer relations.

I am vowing that you can trust the Ramey organization to build a responsible and positive facility. The outstanding wines and acclaim garnered by the Ramey winery may seem very similar to the "marketing noise" you here about many wineries, but believe me this is a company whose results and accomplishments are extremely rare. You should expect no less in this new operation and business endeavor.

Although I am not a traffic engineer, I drive Westside Road on a regular basis, and find this southern end towards the Wohler Bridge to be quite often nearly devoid of what I would describe as "heavy" traffic. I seriously estimate except for less than perhaps 5 weekends a month, even the tasting room traffic is very, very minimal.....you would be surprised, almost unnoticeable.

And, certainly nothing even approaching the backed up traffic, and parking issues, etc., when I used to take my children out to the old Westside Farms in the Fall around Halloween.

Sincerely, Frank & Dawn Darien

Frank Darien

fsonoma@sbcglobal.net

Dear Jennifer Barrett

It was nice to meet you yesterday. I wish to respond to the several pending applications for development along Westside road between Mill Creek Road and the Wohler bridge. I am a homeowner at 6495 Westside Rd. for the last 22 years. There are a number of destination wineries with tasting rooms already on this stretch of the road, and there are applications for at least two additional properties to become not just destination wineries but have event and perhaps lodging capability.

I am specifically concerned about safe travel and the capacity Westside Road to handle the additional traffic. Westside Road is for it's entire length a minimally developed two lane country road. With only two short exceptions, it has a solid yellow line and no passing is permitted. There is no bicycle lane. There is no shoulder for the entire length of West Side Road. In fact, the edge of pavement often ends into deep unimproved ditches. Coming off the roadway even a few inches spells catastrophe for both cars and bicycles.

The county plan calls for the area to be “Intensive Agriculture”. By having permitted multiple destination wineries with expanded functions such as weddings, retreats, restaurants and events beyond the agricultural fundamentals, there has been a gradual conversion of Westside Road into a commercial area. Further permits for commercial development need to be concordant with the County General Plan.

Westside Road is a “Proposed Class III” bicycle route, but presently does not meet criteria for even a Class III designation. I have almost never driven on Westside Road without having to take care to pass bicyclists. It is an extremely popular route for multiple commercial bicycle touring companies, many charity rides and competitive races, on top of everyday cyclists. During crush, travel on the road is especially fraught. Any large truck already takes up all of one lane and more.

I feel that until Westside Road is improved to safely accommodate even the current traffic, and make additional improvements for increased traffic and bicycle safety, the proposed developments should be delayed.

Ward Flad, MD
6495 Westside Rd.

Ramey Winery Project Mitigated Negative Declaration Comments 11-1-18

I am submitting the following comments on behalf of California River Watch (CRW), an Internal Revenue Service Code § 501(c)(3) non-profit, public benefit corporation organized under the laws of the State of California. Its headquarters and main office are located in Sebastopol. Its mailing address is 708 Gravenstein Hwy North, Suite 407, Sebastopol, CA 95472.

CRW has the following concerns regarding the Ramey Winery Project Mitigated Negative Declaration ("MND") :

1.<u>Failure To Provide an Accurate Assessment Of Greenhouse Gas ("GHG") Emissions That Would Be Generated By The Project</u>

The MND defines the scope of GHG emissions that would be generated by the project as follows:

"The primary source of GHG emissions associated with the project would be from traffic generated by the proposed project. Other sources would include direct emissions from natural gas usage and indirect emissions from electricity usage. Winemaking, occurring on-site, generates emissions of CO2 through the fermentation process that are considered biogenic emissions." (MND p. 54-Environmental Checklist, 7.a)

Based on the above defined scope of emissions, the MND refers to a GHG analysis which used Estimator Model, Version 2013.2.2 (CalEEMod) to predict operational period emissions, and mobile emission factors from the California Air Resources Board's EMFAC2011 model. CRW is objecting to limiting the scope of transportation induced emissions to local traffic and trip generation, while failing to consider emissions from wine distribution to regional, United States and global destinations.

The Project includes a new winery building with a maximum annual case production of 60,000 cases, (MND p.1). Sonoma County wines are exported to multiple destinations globally, by sea and air. The global distribution of Sonoma County wines results in thousands of metric tons of GHG emissions annually. There is no analysis in the MND of what percent of the annual 60,000 case wine production would be shipped globally or domestically, contributing to the yearly GHG emissions from wine distribution.

The GHG emissions from the global distribution of wine produced as a result of the Project are a clearly foreseeable, intended consequence of the Project's operation. It is the commercial purpose of the Project to produce wine for global as well as regional patronage. It is standard practice for visitors to local wineries to order cases of wine for distribution to distant locations. The CEQA Guidelines and case law are clear that such readily foreseeable indirect consequences of a project must be accounted for and mitigated if significant.

When preparing the EIR (or MND) for a project, the EIR must consider all sources of GHG emissions resulting from the activities associated with the project. GHG emissions that must be acknowledged, addressed and mitigated include indirect, long-term and long-range emissions such as wine export. These emissions are part of the Ramey Winery Project the MND is analyzing and are appropriate for inclusion in the MND. Under CEQA, a "project" is defined as "the whole of an action, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment . . . ." (Tuolumne County Citizens for Responsible Growth, Inc. v. City of Sonora (2007) 155 Cal.App.4th 1214, 1222 (citing CEQA Guidelines § 15378, subd. (a).)

"An agency shall consider both primary or direct and secondary or indirect consequences. Secondary consequences may be several steps removed from the project in a chain of cause and effect." Cal. Code Regs. Tit. 14, § 15064(d).

"An indirect physical change in the environment is a physical change in the environment which is not immediately related to the project, but which is caused indirectly by the project." Cal. Code Regs. Tit. 14, § 15064(d)(2).

The Court in *California River Watch v. Sonoma County Et Al.* , Case No. SCV-259242, Sonoma County Superior Court (7-20-17),concluded that the record showed the Sonoma County Regional Climate Protection Authority had a feasible ability to include, in a GHG Inventory for its Climate Action Plan (CAP), cross-boundary, transportation induced emissions generated by wine production and tourism in Sonoma County. The failure to include that scale of emissions was determined by the Court to be a prejudicial abuse of discretion in the preparation of the Programmatic EIR. It was a failure to provide sufficient information for informed decision making and public participation. The Court's reasoning is equally applicable here regarding the MND for a winery project which will generate thousands of tons of transportation induced GHG emissions from wine export over multiple years.

2. Failure To Propose Enforceable Mitigation Measures With Clearly Defined Performance Standards

Mitigation measures must be definite and defined so that their effectiveness is ascertainable. See, *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal. App. 4th 70.

2.a: Storm Water Pollution Control

The MND, at page 61, refers to a Preliminary Storm Water Mitigation Plan (Plan) which identifies sources and pollutants of concern which include landscape and planting areas which could result in sediment, nutrients, pesticides, pathogens, trash and debris. Parking lots and driveways could result in sediments, metals, total petroleum hydrocarbons and trash. All of these pollutants of concern have potential to discharge at harmful levels into the adjacent Russian River in storm water runoff from the Project.

As explained in the MND, the Plan relies heavily on directing storm water flows to the on-site vegetated buffer areas to allow for treatment as a Best Management

Practice (BMP) to prevent the discharge of polluted runoff from the Project. The MND claims "These BMPs have been designed to meet Sonoma County Low Impact Development (LID) Manual requirements.". There is no mention of a sampling program to verify the effectiveness of these measures. The Plan provides for a BMP Maintenance and Monitoring plan to be prepared by the property owner post Project approval. "At minimum, the maintenance plan shall include: the scope and frequency for inspection and scheduled maintenance, provisions for unscheduled maintenance, estimated design life including replacement." Conditions of approval require access for inspection by responsible agencies." If remediation of problems is required because maintenance is inadequate, County staff may enter the property and take necessary steps to restore the BMPs to good working order. The property owner shall be responsible for reimbursing the County for expenditures associated with restoring the BMPs to good working order." (MND p. 61)

The above description of storm water pollution mitigation is a classic example of mitigation measures lacking clearly defined performance standards to ensure their effectiveness and of deferred mitigation, both in violation of CEQA.

2.b. Traffic Congestion And Public Safety

The MND offers the following measure to avoid the impacts of multiple events from the over concentration of hospitality facilities on Westside Road:

"To avoid the potential for multiple large events occurring simultaneously, PRMD has encouraged wineries to coordinate event schedules amongst each other. The applicant is willing to do implement such coordination. For this project, a condition of approval requires the Permit Holder to coordinate with the two existing wineries (Williams-Selyem and Arista) closest to the project site." (MND p.98)

Here there is no effort to define what would constitute adequate "coordination" to satisfy this condition of permit approval. Would it require no two wineries to schedule events on the same day? Would it only apply to events expected to attract some set minimum number of guests? Again, there are no clear standards to ensure effective mitigation.

3. <u>General Plan Factors For Denial</u>

CRW concurs with the comment from the Maacama Watershed Alliance that the Project meets all three General Plan factors for denial; 1)Commercialization of agricultural lands, 2) A threat to public safety, 3) A detrimental concentration of commercial facilities in the 6000 to 7000 block of Westside Road.

In light of the above concerns, California River Watch requests that the County not approve a discretionary use permit for the Ramey Winery Project and decline to adopt the associated Mitigated Negative Declaration.

Respectfully submitted on behalf of California River Watch,

Jerry Bernhaut, Esq.

Revised- Recirculated
Mitigated Negative Declaration

Sonoma County Permit and Resource Management Department
2550 Ventura Avenue, Santa Rosa, CA 95403
(707) 565-1900 FAX (707) 565-1103

Publication Date: November 11, 2018
Adoption Date: December 11, 2018
State Clearinghouse: November 9, 2018
Public Hearing Notice: November 9, 2018
Revision Date: October 15, 2018

SCH #: 2017-082052

Pursuant to Section 15073.5 of the State CEQA Guidelines, the original Mitigated Negative Declaration and attached initial study checklist were revised on October 23, 2018 and on November 9, 2018, recirculated through the State Clearinghouse. The Recirculated Mitigated Negative Declaration modifies the original Mitigated Negative Declaration, dated August 2017, to provide additional information on the proposed wine cave construction for the project and additional information under the following Environmental Factors: Aesthetics, Air Quality, Geology & Soils, and Hydrology & Water Quality.

In addition, pursuant to Section 15073.5 (a) & (b) - (1) of the State CEQA Guidelines, the Recirculated Mitigated Negative Declaration was recirculated to discuss and incorporate an additional mitigation measure and monitoring under Environmental Factor 1, Aesthetics, Mitigation Measure and Monitoring 1.a. (3) was incorporated into the project to require the spoils from the wine cave excavation be located outside of the Scenic Highway Corridor setback and be screened from the public road by existing structures and existing or proposed landscaping to the extent feasible. Under Environmental Factor 3, Air Quality. Mitigation Measure and Monitoring under 3.b. (2) was incorporated into the project to require prior to any construction or grading, that further sampling of soil shall be conducted to verify whether naturally occurring asbestos is present. If naturally occurring asbestos is encountered, the project applicant shall prepare an asbestos dust mitigation plan that complies with the California Air Resources Board (CARB) Airborne Toxic Control Measure 93105, and the provisions of the BAAQMD naturally occurring asbestos program. These provisions require, but not limited to, such measures as limiting construction vehicle speeds to 15 miles per hour, wetting the site prior to and during grading, wetting or covering stockpiles, and washing equipment.

It is recognized that the project site is located in the Northern Sonoma County Air Pollution Control District (NSCAPCD), however, this District does not have its own program, therefore, the provisions under the local BAAQMND's program is required.

In addition, under Environmental Factor 9 Hydrology & Water Quality, Mitigation Measure and Monitoring under 9 (c) 1, was incorporated into the project to require that prior to grading or building permit issuance, construction details for all storm water best management practices (BMPs) shall be submitted for review and approved by the Engineering Section of Permit Sonoma. The construction plans shall be in substantial conformance with the conceptual plan reviewed and approved at the planning permit stage. The applicant shall submit an Erosion and Sediment Control Plan prepared by a registered professional engineer as an integral part of the planning and permitting process, including cave excavation. The Erosion and Sediment Control Plan shall be subject to review and approval by Permit Sonoma prior to the issuance of a grading permit. The Plan shall clearly show limits of disturbed areas, vegetated areas to be preserved, cave spoils storage and fill placement areas, pertinent details, notes, and specifications to prevent damage and minimize adverse impacts to the environment.

Furthermore, Mitigation Measure and Monitoring under 9(c) 2 was incorporated into the project to require that excavation, handling, transport and/or any deposit of fill that involves soil or material containing naturally-occurring asbestos (serpentine) shall comply with all applicable State [and BAAQMD program] regulations, including but not limited to 17 CCR §93105.

The project applicant has agreed to all mitigation measures and monitoring contained in in the attached initial study checklist.

This statement and attachments constitute the Revised-Recirculated Mitigated Negative Declaration as proposed for adoption by the Sonoma County Board of Supervisors, the decision-making body for the project described below.

Project Title:	Ramey Winery
PRMD file#:	UPE14-0008
Project Location Address:	7097 Westside Road, Healdsburg, CA.
APN:	110-240-031, -032, and -040
Lead Agency:	Sonoma County Permit and Resource Management Department
Decision Making Body:	Board of Zoning Adjustments
Project Applicant:	David and Carla Ramey

Project Description: Request for a Use Permit to construct a new winery building (two story, approx. 32,210 square feet) with a maximum annual case production of 60,000 cases, a new wine cave (approx. 20,720 square feet), a conversion of an existing hop kiln building to a public tasting room open from 10 am to 5 pm, 7 days a week, and a conversion of an existing hop baling barn to a private tasting room with a two-guest room marketing accommodation unit on the upper floor. The request includes 22 agricultural promotional events per year with a range of maximum guests (10 events with 30 guests, 5 events with 60 guests, 5 events with 120 guests, & 2 events with 300 guests), and participation an industry wide events totaling two event days with a maximum of 300 guests on a parcel 75 acres in size. On the west side of the project site, agricultural promotional events will be limited to a maximum of 30 guests and industry wide events will not occur on this side of the project site. A four- year Use Permit with a one year extension of time is requested under Section 26-92-130 of the Zoning Code. No weddings, receptions, or concerts are proposed. The parcel is under a prime Land Conservation Contract. No vines will be removed to accommodate the winery facility or site infrastructure.

Zoning: LIA B6-60; F1, F2, RC200/100, SR, VOH (Land Intensive Agriculture; 60 acres per dwelling unit, Flood Plain; Riparian Corridor 200/100; Scenic Resources; Valley Oak Habitat Combing Districts – east of Westside Road); and LIA B6-60; SR (Land Intensive Agriculture; 60 acres per dwelling unit; Scenic Resources – west of Westside Road).

The parcel is not currently zoned HD (Historic Combining District). All project development, including the new construction, existing buildings, driveways, septic systems, wastewater system, parking and landscape areas are located outside of the Riparian Corridor setback and outside of the F1 (Floodway) and F2 (Floodplain).

The project site is one legal separate parcel bisected by Westside Road and due to this has different APN numbers. A road does not in of itself create legal separate parcels. The 75- acre project site cannot not be divided or sold separately.

General Plan Land Use Designation: Land Intensive Agriculture 60 acre density (east of Westside Road) and Land Intensive Agriculture 100 acre density (west of Westside Road).

Environmental Finding: Basis on the attached revised Initial Study, the project described above will not have a substantial adverse impact on the environment, provided that the mitigation measures identified in the Initial Study are included in the project.

Revised Initial Study: See attached.

Revised Mitigation Measures: Included in attached Initial Study. The project applicant has agreed to implement all mitigation measures.

This report is the Initial Study required by the California Environmental Quality Act (CEQA). The report was prepared by Traci Tesconi, Project Planner with the Sonoma County Permit and Resource Management Department, Project Review Division. Information on the project was provided by the applicant. Additional information was provided by various consultants as identified in this Initial Study. Technical studies referred to in this document are available for review at the Permit and Resource Management Department.

SETTING: Surrounding Land Use and Zoning:

Land use in the project vicinity is primarily vineyard, wineries, tasting rooms, small family farms, and single family residences. The zoning designation in the project vicinity is LIA (Land Intensive Agriculture) due to its rich farming soils. The project site is located on both sides of Westside Road. Westside Road runs approximately 12 miles from Hacienda Bridge in Forestville to Highway 101 in Healdsburg. The closest wineries and tasting rooms within one-half mile of the project site are:

1) Williams- Selyem Winery to the south- approximately 725 feet
2) Arista Winery to the north –approximately 830 feet
3) Gracianna Tasting Room to the north – approximately 1,093 feet (no events)
4) Allen Family Vineyard and Winery (no tasting room or events)

Lands surrounding the subject property are residential and agricultural with vineyards and wineries. To the east is the Russian River, which includes riparian habitat and oak woodland along with vineyards. On the other side of the Russian River is Riverfront Regional Park.

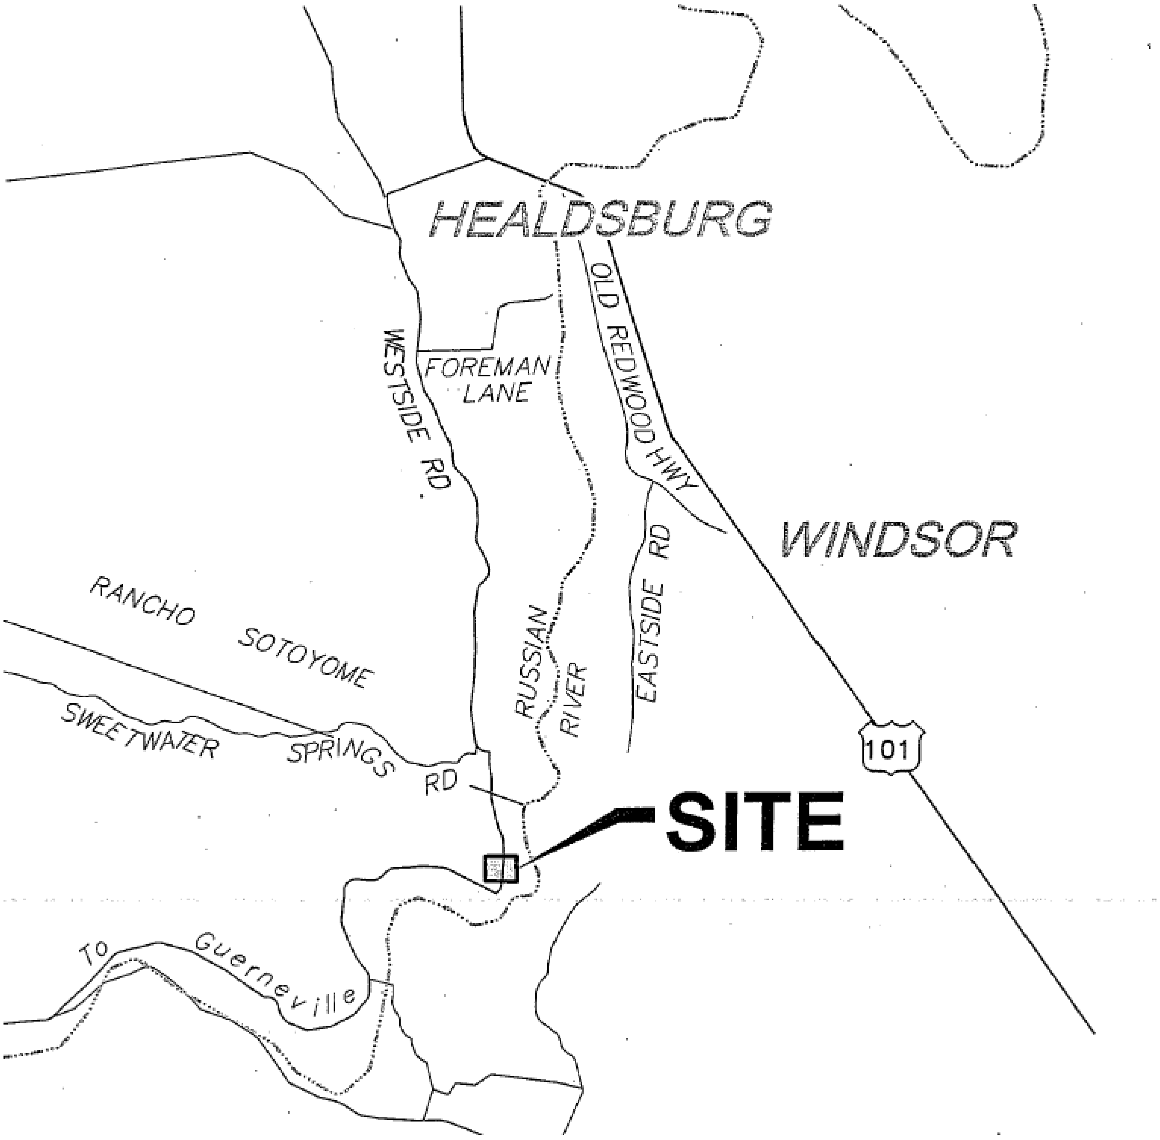
The project site is located outside of the Dry Creek Valley Citizens Advisory Committee referral area. The project referral was sent public interest groups: Westside Community Association (WSA) and Westside Association to Save Agriculture (WASA).

OTHER PROPOSED PROJECTS ON WESTSIDE RD:
As of January 1, 2014 to February 21, 2017, there are three other winery related projects filed with PRMD besides this proposed project:

- PLP14-0031; 4603 Westside Rd, 10,000 case winery, public tasting room, and 12 promotional event days with a maximum of 180 people and 13 industry-wide event days, plus winemaker meals not proposed as events. No weddings are proposed. North of proposed project. Located approximately 2.5 miles from this project site. In July 2017, the Board of Zoning Adjustments denied the request. The applicant filed an appeal to the Board of Supervisors. (Appeal hearing pending).

- PLP15-0032; 4075 Westside Rd, Stand-alone tasting room. (Withdrawn) No special events, including agricultural events, promotional events, industry-wide events and/or tours, are proposed. North of proposed project. Located approximately 3 miles from this project site. The public hearing was held on August 17, 2017, it was denied by the Board of Zoning Adjustments. The applicant filed an appeal to the Board of Supervisors. On February 12, 2018, the applicant withdrew the appeal and Planning application filed under (PLP15-0032).

- UPE16-0102; 6677 Westside Rd, 492 case winery, public tasting, tours, appointment only food and wine tasting service, and annual agricultural promotional events (four w/ 100 guests, and 14 w/ 50 guests with no outdoor amplified music. Adjacent parcel to the north of proposed project. Located approximately .40 miles from the project site. (Incomplete/Pending).



PROJECT DESCRIPTION

A Use Permit for:

- A new winery building (two story, approx. 32,210 square feet) with a maximum annual case production of 60,000 cases. The winery building would be built into the hillside meadow in front of the wine caves, using a cut-and-fill, low-profile design. Grapes will be locally sourced, primarily on-site and from Sonoma County, as well as from bordering counties. All processing, aging, bottling, and storage of wine will be done indoors. Features include processing area, bottling area, wine storage and tank areas, administrative offices, employee kitchen/breakroom, employee shower and locker room, technical tasting rooms, a wine library, a commercial kitchen, employee and public restrooms.

- Wine cave (approx. 20,720 square feet) for wine vault storage (long-term aging of wine in barrels). The wine cave will be a Class II wine cave not open to the general public. The proposed wine cave will be 36 feet wide and 16 feet high. The wine cave will be located on the east side of the project site, on a hillside on the project site sloping to the northeast from an existing vineyard down to the pond and existing buildings. The ground surface inclination is approximately 12 horizontal to 1 vertical (12:1). The wine cave will have three portals. It will be constructed by cut-and-cover grading; the area will be excavated, the structure for the cave will be erected, and then excavated soil will be filled in above and around the structure. The portals will be located along the new winery building wall approximately 260 feet in length. The wine cave area excavation will require cuts up to 22 feet deep, which will be temporarily shored during construction. The wine cave structure will include cast-in-place foundations, stem walls and concrete slabs, and pre-cast tunnel arch segments. Soil material from the cave area will be used to fill over the top of the cut and cover cave. All of the soil generated from this excavation, as well as from other grading for the winery, would be placed in temporary stockpiles only on the west side of the project site. These stockpiles are anticipated to total 15,843 cubic yards of material, of which 9,575 cubic yards will be from the cut-and-cover grading operation. The soils will then be used to backfill around the wine cave structure, and for grading and landscaping around the new winery building. Any stockpiling of cave spoils shall be located outside of the scenic corridor setback and maintain a 50-foot setback from the on-site reservoir.

- Conversion of hop kiln building to public tasting building with two rooms with wine tasting bars, a commercial kitchen, public restrooms, case-good storage, general storage, and office supply storage room. Includes an elevator.

- Conversion of a hop baling barn to a private tasting room with wine bar, a commercial kitchen, and VIP lounge area on middle floor. A two-guest room marketing accommodation with full bathrooms and lounge area on upper floor. A general storage on lower floor. Includes an elevator.

- Food and wine pairing is proposed in the public and private tasting rooms.

- New parking areas added to east and west side of project site. East side includes: 20 standard spaces, 4 handicap accessible spaces, and 58 overflow parking spaces (unmarked gravel area). West side includes: 13 standard spaces, 2 handicap accessible spaces, and 21 overflow parking spaces (unmarked).

- New winery wastewater disposal system with pre-treatment system and disposal via on-site vineyard irrigation system. The process waste will be pre-screened at collection points in the facility and directed to an aerobic treatment unit (manufacturer to be determined). The treatment unit will reduce waste strength and suspended solids to levels approved by the State Water Quality Control Board for surface irrigation. The treated wastewater will be directed to storage until discharged to irrigation. Treated wastewater will be pumped to a point of connection to the vineyard irrigation system. The process system will be subject to a Waste Discharge Permit issued by the State Water Quality Control Board, North Coast Region.

- New domestic septic systems on east and west side of project site to serve all employee and guest restrooms. The septic systems will be subject to a Septic Permit and Plans issued by the Well and Septic Section of PRMD.

- Two new driveway improvements on east and west side of project site. Sight distance improvements by removing vegetation and terracing west side of project site along Westside Road. Driveway and sight distance improvements will be subject to an Encroachment Permit issued by the Engineering Section of PRMD.

- Existing on-site wells to be used for all winery and domestic uses.

- None of the existing vineyard will be removed to accommodate the proposed use or infrastructure.

- The 42 acre on-site vineyard consisting of Chardonnay (32 acres) and Pinot Noir (10.5 acres) grapes. The Project Proposal Statement explains the on-site vineyard produces 250 tons of grapes. The Chardonnay grapes will be processed on site in the proposed winery. The Pinot Noir grapes are leased to another winery on a long term basis. The former Chardonnay grape contracts expired at the end of the 2016 harvest. The Winery Trip Generation Form prepared by W-Trans, states approximately 720 tons of grapes would be imported to the project site from local areas in order to reach the maximum annual production capacity of 60,000 cases. This calculates to approximately 62 cases/ton, which is consistent with industry standards which range between 58 to 65 cases/ton based on grape variety and processing operations.

Hours of operation:

- Winery operations: Monday through Friday, 7:00 a.m. to 6:00 p.m. Non-Harvest Season. Monday through Friday, 6:00 a.m. to 10:00 p.m. Harvest Season
- Tasting Room hours: 10:00 a.m. to 5:00 p.m., 7 days a week
- Industry- Wide events: 11:00 a.m. to 5:00 p.m. , two event days per year
- Agricultural Promotional Events: Varies. 11 a.m. to 3 p.m., 9 a.m. to 9 p.m., or 6 p.m. to 9 p.m.

The following Table provides the proposed events and locations on the project site:

Ramey Wine Cellars Proposed Ag Promotional Events
UPE14-0008

Industry-wide Event	Total of 2 event days per year	10 am - 5 pm (*)	300	Tasting rooms, and outdoor walnut grove

New wine release tastings – by invitation only	2	9 am - 9 pm	300	Tasting rooms, and outdoor walnut grove
Private tastings	5	9 am - 9 pm	120	Tasting rooms, and outdoor walnut grove
Private tastings	5	11 am - 3 pm; or 6 pm - 9 pm	60	Tasting rooms, and outdoor walnut grove
Winemaker lunches or dinners with on-site food preparation, and food and wine pairings	10	11 am - 3 pm; or 6 pm - 9 pm	30	Baling barn, outdoor walnut grove, and winery

(*) Industry wide events must occur during the public tasting room hours.

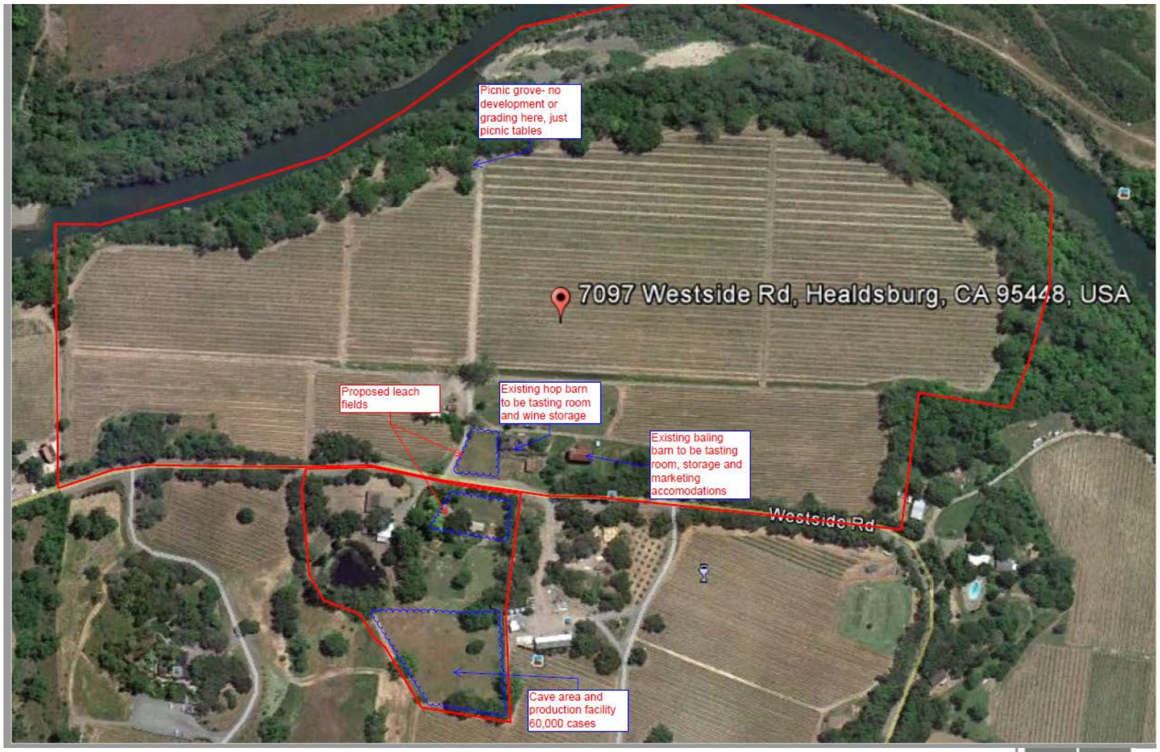
East Portion of Project Site:
The improvements on the eastern portion of the property will include refurbishing the hop kiln building into a public tasting room, leaving the exterior similar to its current appearance while maintaining the furnace and duct work in the south side of the building intact to demonstrate the building's original use. The 3-story baling barn would also be refurbished as a private, invitation only tasting room, which would include equipment storage on the ground level; a kitchen and meeting area for private tastings and meals on the midlevel; and two bedrooms as marketing accommodations on the top (third) level, with two work stations. These guest rooms are to be used solely as marketing and industry related accommodations with no fee charged and not for commercial purposes. These two buildings are to be connected by an elevated walkway utilizing a railcar trestle which historically was used during hop harvests to carry dried hops from the kiln to the baling barn. The baling barn will also be refurbished to maintain its current appearance. An existing 1,250 sq. ft. residence is to be removed in order to accommodate the associated parking, driveway and landscaping improvements. The project would provide for all on-site parking for tasting room and event activity. The parking area is to be landscaped providing a separation between primary parking field and overflow parking. The entrance to the property is to be improved with an asphalt driveway that would transition to chip seal base for the primary parking area, gravel for the overflow parking and for the vineyard access road. A new gate will be installed at the entrance to the east side of the property.

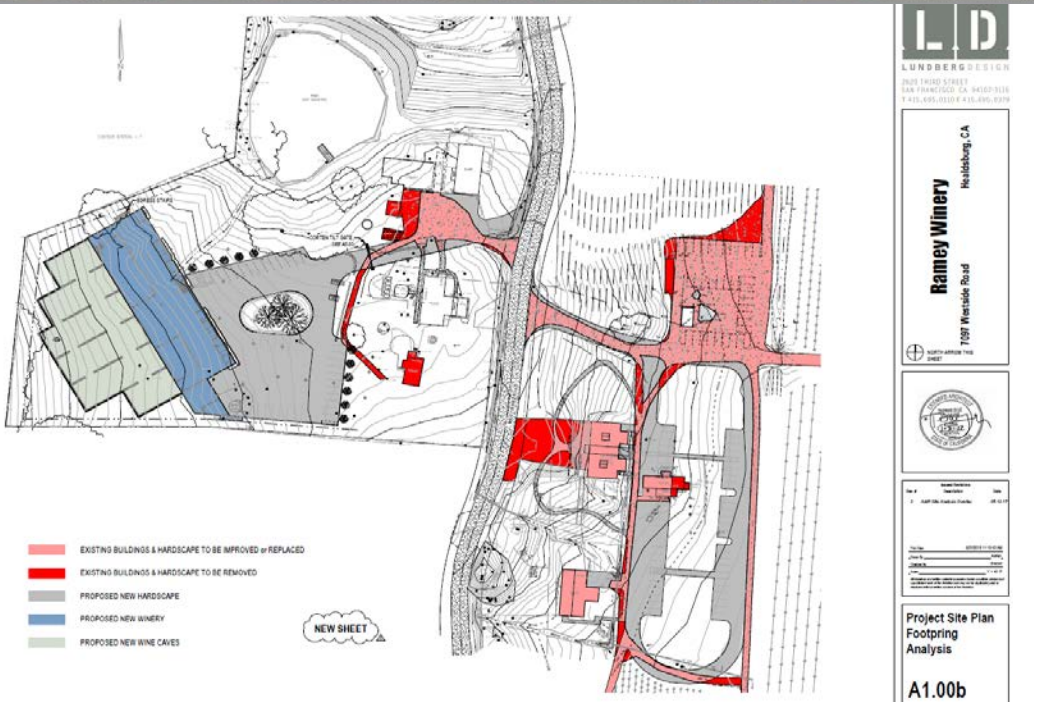
West Portion of Project Site:
The west side of the property is to be developed with a two-story winery in front of the wine caves. The winery will use a cut-and-fill, low-profile built into the hillside meadow to reduce visible impacts from Westside Road. Grapes will be locally sourced, primarily on-site and from Sonoma County, as well as from bordering counties. The 32,210 sq. ft. winery building will include all indoor processing, bottling, aging, and storage of wine. Features consist of tank rooms, offices, technical tasting rooms, a wine library, laboratory, case good storage, mechanical room, an employee breakroom/kitchen, and a commercial kitchen. Behind the winery is a 20,720 sq. ft. wine cave constructed below grade that will serve vault storage (long term aging of wine in barrels) of the wine processed on the site. Associated landscaping improvements will be done around the parking areas. One 300 sq. ft. shed and a 925 sq. ft. residence would be removed, while all other existing structures would remain (2,000 sq. ft. residence; 1,800 sq. ft. barn; and

1,800 sq. ft. shed) with no development occurring near the existing 3 ½ acre reservoir.

The proposed facility (winery and tasting facility) would employ a total of 15 fulltime; 3 part time; and 6 seasonal employees for a total of 24 employees. There will be no weddings, no wedding receptions, or rental of any of the facilities to outside parties.

Overall Site and Aerial Plan for Ramey Winery:





SITE CHARACTERISTICS

The parcel is located approximately 7.2 miles southwest of the City of Healdsburg, along both sides of Westside Road, within Section 21, Township 8 North; Range 9 West, MDBM. The property is known as Westside Farms and is comprised of one legal parcel of record, under three Assessor's Parcel Numbers (110-240-031; 110-240-032; and 110-240-040) totaling 75 acres in area. The subject property is bisected by Westside Road, with approximately 6.5 acres situated to the west of Westside Road and 68.5 acres lying on the east side of Westside Road. The western 6.5 acres is currently developed with two single family residences, a barn, a pole barn two out buildings and a 3 ½ acre-foot reservoir. The eastern 68.5 acres is planted with approximately 42 acres of vineyard (Chardonnay and Pinot Noir grapes) and contains an existing hop kiln structure (6,850 sq. ft.) and hop baling barn (5,290 sq. ft.) constructed sometime between 1915 and 1930, and are in a state of disrepair. These structures are to be refurbished as part of the proposal. There is also currently a 350 sq. ft. pump station, a 1,250 sq. ft. home that is to be removed located east of the hop kiln and baling barn. The eastern portion of the property gently slopes downward and eastward toward the Russian River to the east. The existing 42 acre vineyard extends from the western end of Westside road easterly to the tree line adjacent to the Russian River.

The vineyard is accessed and bordered by an existing dirt/gravel access roadway that forms a perimeter around the vineyard that provides access for maintenance. The Russian River forms the eastern boundary of the site and can be accessed by an existing access road located at the eastern end of the property. Also located near the eastern end of the site is an elevated electrical utility box above the floodplain for the well pumps that serve the vineyard. The hop kiln and baling barn tasting rooms are located approximately 950 feet west of the Russian River. Additionally, on the eastern end of the property near the Russian River is a grove of walnut trees. This area is not proposed for development but, will be used for outdoor agricultural promotional events. The property in general (both east and west sides) also contains oak woodland, ruderal non-native grassland and landscaped areas.

The western portion of the property also gently slopes from west to east down toward Westside Road and is currently developed with an existing 925 sq. ft. home (to be removed); an existing 2,000 sq. ft. home (to remain); an existing 1,800 sq. ft. barn (to remain); an existing 1,800 sq. ft. shed (to remain); a 300 sq. ft. shed (to be removed); and a 3 ½ acre-foot reservoir. The existing reservoir does appear to support some willow and other riparian vegetation. As noted above, the western portion of the property is to be developed with the new winery and the wine caves.

Since the 1800's the property has been used for agriculture, including fruit orchards, hops and currently is planted in grapes. In 1988, the project site was known as Westside Farms, a vegetable farm and pumpkin patch with hay rides starting in 1989 and continuing until 2000. The project proposal statement and traffic study prepared for the proposed project states that in 1988 Westside Farms operated as a diversified agricultural operation with a pumpkin patch and farm store with hay rides starting in 1989. Initially, during the mid-1990's Westside Farms was open five to six days each week from May through November. After that they were open to the public seven days a week during the month of October. Weekdays were focused on school groups totaling 200-400 children arriving in school buses and car pools, with an additional 100-200 children arriving after school. Weekends would see 300 to 1000 cars arriving over the course of a day with 400-600 maximum people on site at any one time. At any given moment, 200-300 cars might have been parked on site. In 1990, 32 acres of Chardonnay grapes and 10 acres of Pinot Noir grapes were planted.

Access to the property is from Westside Road, via two existing 20-ft wide driveways (each serving both sides of the property east/west). The property is currently served by on-site well water and septic. The site is within a Type I Williamson Act Contract.

RESPONSIBLE AND TRUSTEE AGENCIES

The Regional Water Quality Control Board (RWQCB) must approve a Waste Discharge Requirements/permit or waiver thereof prior to PRMD's issuance of a building permit construct the winery and associated improvements. In addition, the State of California, State Drinking Water Program will be required to issue a permit for an on-site water supply prior to issuance of a building permit that the facility is able to meet minimum water quality requirements for drinking water.

The permitting for the winery building, the wine cave construction (cut and cover excavation), and the restoration of the two hop kiln buildings will require Building permits, Fire approval, Grading and Septic permit approvals under the authority of the Sonoma County Permit and Resource Management Department.

ISSUES RAISED BY THE PUBLIC OR AGENCIES

A referral packet was sent to the appropriate local, State, and Federal agencies, and special interest groups anticipated to take interest in the project. The following issues were raised:

- Overconcentration of wineries, tasting rooms, and events on Westside Road
- Existing buildings located within the scenic corridor
- Re-use/re-construction of historical hop kiln buildings
- Proposed project's compliance with the Land Conservation Act (Williamson Act) and the local Uniform Rules for Agricultural Preserves
- Potential traffic impacts
- Potential noise impacts
- Potential groundwater impacts

INITIAL STUDY CHECKLIST

This checklist is based on Appendix G of the State CEQA Guidelines. For each item, one of four responses is given:

> **No Impact: The project would not have the impact described.** The project may have a beneficial effect, but there is no potential for the project to create or add increment to the impact described.
>
> **Less Than Significant Impact**: The project would have the impact described, but the impact would not be significant. Mitigation is not required, although the project applicant may choose to modify the project to avoid the impacts.
>
> **Potentially Significant Unless Mitigated:** The project would have the impact described, and the impact could be significant. One or more mitigation measures have been identified that will reduce the impact to a less than significant level.
>
> **Potentially Significant Impact:** The project would have the impact described, and the impact could be significant. The impact cannot be reduced to less than significant by incorporating mitigation measures. An environmental impact report must be prepared for this project.

Each question on the checklist was answered by evaluating the project as proposed, that is, without considering the effect of any added mitigation measures. The checklist includes a discussion of the impacts and mitigation measures that have been identified. Sources used in this Initial Study are numbered and listed on page 10, 11, and 106. Following the discussion of each checklist item one or more sources used are noted in parentheses.

The applicant has agreed to accept all mitigation measures listed in this checklist as conditions of approval of the proposed project and to obtain all necessary permits.

ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED:
The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a “Potentially Significant Impact” or “Less than Significant with Mitigation” as indicated by the checklist on the following pages.

Table of CEQA topics identified as having “Potentially Significant Impact” or “Less than Significant with Mitigation”

CEQA Topic	Yes	No
Aesthetics	Yes	
Agricultural & Forest Resources	Yes	
Air Quality	Yes	
Biological Resources	Yes	
Cultural Resources	Yes	
Geology and Soils	Yes	
Greenhouse Gas Emission		No
Hazards and Hazardous Materials		No
Hydrology and Water Quality	Yes	
Land Use and Planning	Yes	
Mineral Resources		No

Noise	Yes	
Population and Housing		No
Public Services		No
Recreation		No
Transportation and Traffic	Yes	
Utility and Service Systems		No
Mandatory Findings of Significance	Yes	

Incorporated Source Documents

In preparation of the Initial Study checklist, the following documents were referenced/developed, and are hereby incorporated as part of the Initial Study. All documents are available in the project file or for reference at the Permit and Resource Management Department.

_X_ Project Application and Description
___ Initial Data Sheet
_X_ County Planning Department's Sources and Criteria Manual
_X_ Sonoma County General Plan and Associated EIR
___ Specific or Area Plan: none

1. AESTHETICS – Would the project:

a) Have a substantial adverse effect on a scenic vista?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
		X		

Comment:
1.a and 1.b Less Than Significant with Mitigation Incorporated:

Scenic Corridor:
Westside Road is designated as a Scenic Resource (Scenic Corridor) by the Sonoma County General Plan (Figure OSRC-1). However, the site itself is not designated as a Scenic Landscape Unit in the Open Space and Resource Conservation Element of the General Plan. These areas are identified under General Plan Objective OSRC-3.1, for scenic corridors along "…roadways that cross highly scenic areas, provide visual links to major recreation areas, give access to historic areas, or serve as scenic entranceways to cities." New development, other than barns and similar agricultural support buildings, are generally prohibited within an area equal to 30 percent of lot depth, to a maximum of 200 feet, measured from centerline of a Scenic Corridor.

The proposed winery building and wine cave are located approximately 240 to 260 feet from the front property line, 10-feet from the side property lines, and 20-feet from the rear property line, and located outside of the 200-foot from the centerline of Westside Road, conforming to the

Scenic Corridor setback and all other LIA zoning district setback requirements. Spoils from the wine cave excavation are also required to be placed outside of the Scenic Corridor setback and on the west side of the project site.

As discussed below under the Item 11. Noise section, to reduce noise associated with heavy trucks and winery activity noise, a noise barrier/retaining wall is required. This noise barrier/retaining wall will be located on the south side of the winery building and located outside of the 200-foot Scenic Corridor setback along Westside Road. In this same location, to reduce winery operation noise, a 6-foot high solid wood fence would be installed at the southerly property line extended for 100 feet parallel along the southerly property line. The wood fence would encroach into the scenic corridor setback, but, would be shielded by existing the existing residence and existing landscaping in the site frontage. The wood fence design would be typical fence design see on agricultural or residential properties.

The existing hop kiln building and bale barn are located within the Scenic Corridor 200-foot setback. Under Section 26-64-030 (a) -3 it states, in part, development within the setback shall be prohibited with the following exceptions, where such uses are allowed by the base district with which this district is combined:

(3) Maintenance, restoration, reconstruction or minor expansion of existing structures;

<u>Design Review Committee/Sonoma County Landmarks Commission Meetings</u>:

On December 2, 2014, the proposed project went before a joint review with the Design Review Committee and the Sonoma County Landmarks Commission to review the project proposal and project plans. On December 2, 2014 for following actions were taken:

DRC: Unanimously voted to approve:
- The existing height of the Hop Kiln and Bale Barn buildings which exceeds 35 feet.
- Maintaining the two structures (Hop Kiln and Bale Barn buildings) in their current footprint within the Scenic Corridor setback.

Landmarks Commission/ DRC decided to require:
- Final review of the project to be jointly done by the Landmarks and DRC Committees, after a final decision is made on the project.
- The HD (Historic Combining District) be added to the entire property.

At the applicant's request, on July 7, 2015, the project went back to the Sonoma County Landmarks Commission. The applicant requested that the HD overlay zone on the west side of the project site not be required since this side does not contain any existing structures that appear to be eligible to the California Register. To support the applicant's request, a Supplemental Historical Resource Study prepared by Knapp Architects, dated March 2015, was provided to the Landmarks Commission. The Knapp report concludes that although the Main House and Barn are definitely very old, neither they nor the rest of the subject property appear eligible to the California Register.

At the July 7, 2015, Landmarks Commission meeting, the Commission voted unanimously to:

- Recommend addition of the HD Combining Zone and Landmark Designation on APN 110-240-031 in its entirety (east side of Westside Road). Landmarks Commission recommended not adding the HD combining zone on APN 110-240-040 (west side of Westside Road). Their decision was based on findings that the historic resources on the east side of Westside Road met the eligibility and integrity criteria for State and Local

County designation and the HD Combining Zone; while the structures on the west side of Westside Road had changed over time to the extent that they no longer retained historic integrity that met eligibility criteria.

The Use Permit shall be conditioned to require:

- Prior to issuance of any grading permits or building permits on APN 110-240-031, the applicant shall submit a complete application and current processing fee for Level 1 zone change to add the HD Combining Zone and Landmarks designation on APN 110-240-031 (east side of Westside Road). (Adding the HD combining district to the APN may be processed as a part of the Comprehensive Planning Division's semi-annual package of zone changes required as conditions of approval.)

The hop kiln buildings on the east side will remain intact, but will be refurbished with their original architecture remaining the same. A new bridge connecting the two structures will be introduced, but as noted this bridge was once part of the original architecture connecting the uses of the two hop buildings. A new parking area and overflow area will be introduced on the east side as well along with landscaping. These new parking areas are required to meet rural lighting standards. New landscaping will shield new asphalt and paving from Westside Road and should act to blend with the adjacent vineyard.

On the west side of Westside Road, the new winery building and wine caves will employ a cut and fill approach to result in a low profile building which will be further screened by the existing topography on the west side. The maximum height of the winery building will be 29-feet. Although there will be new lighting introduced as a result of the new winery facility, the proposed lighting is to be down cast type lighting which will minimize glare and spillage of light onto adjacent properties. There will be a total of 12 trees removed in order to accommodate the new winery, however, the landscape plan proposes new trees and ground cover that will serve to screen the building from the public right-of-way. Much of the vegetation between Westside Road and the new winery building will remain, with the trees only being removed where the new winery is to be located. Final design review is required prior to any grading or building permit issuance. Approval of a final lighting and landscaping plan that will maintain nighttime lighting levels at a minimum necessary to provide for security and safety. The light plan shall include a photometric lighting plan that illustrates that there will be no light spillage onto adjacent properties and onto Westside Road. The landscaping plan shall address and include appropriate tree and shrub species that will adequately screen the proposed structure from the public right-of-way.

As recommended with prior review, a joint review before the Design Review Committee and the Sonoma County Landmarks Commission is required. Therefore to ensure the proposed project does not have an adverse aesthetic effect on the rural or scenic setting of the area, the following Mitigation Measure has been incorporated into the project:

Mitigation Measure 1.a. (1). Prior to issuance of any grading permit for the winery or tasting room development project, a joint meeting shall be held by the Design Review Committee and Sonoma County Landmarks Commission to review and grant final approval on the site plan, building elevations, circulation, parking, landscaping, irrigation, signage, and exterior lighting plans to minimize any visual impact through design and landscaping improvements. The applicant shall comply with the recommendations listed on the joint DRC/Landmarks Commission Action Sheet, dated December 2, 2014, and any subsequent recommendations.

Mitigation Monitoring 1.a. (1): The Permit and Resource Management Department shall not issue any grading, building, or other development permit until the required plans have been given final approval from the Design Review Committee and Sonoma County Landmarks Commission. PRMD shall not issue temporary or final occupancy for any related building permit until a site inspection of the project site has been conducted by the Project Planner to verify exterior building colors, landscape improvements, signage, and exterior lighting have been installed in accordance with approved plans.

Mitigation Measure 1.a. (2): Prior to issuance of final occupancy on any related building permit, landscape planting and irrigation shall be installed in accordance with the plans approved by the Design Review Committee and Sonoma County Landmarks Commission. A site inspection by the Project Planner is required and a letter from the Landscape Architect or Contractor must be submitted verifying landscape and irrigation installation is in accordance with approved plans.

Mitigation Monitoring 1.a. (2): The Permit and Resource Management Department shall not issue final occupancy on any building related permit until it has been verified by a site inspection by the Project Planner and a letter from the Landscape Architect or Contractor that landscaping and irrigation have been installed in accordance with approved plans.

Mitigation Measure 1.a. (3): The spoils from the wine cave excavation shall be placed outside of the Scenic Highway Corridor and screened from the public road by existing structures and existing or proposed landscaping to the extent feasible.

Mitigation Monitoring 1.a. (3): If the Permit and Resource Management Department staff observes during the development of the project that spoils are located within the Scenic Corridor setback, or receives a complaint, the applicant will be required to remove and relocate the spoils or the Use Permit may be subject to modification or revocation.

With the implementation of these mitigation measures, the project effect on scenic vistas and scenic resources would be reduced to a less than significant impact. (Also see item 1.d, below, regarding mitigation for night lighting.)

b) Substantially damage scenic resources, including, but not limited to trees, rock outcroppings, and historic buildings within a state scenic highway?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
		X		

As noted above under item 1(a), the frontage road to the project site, Westside Road, is designated as a Scenic Resource (Scenic Corridor) by the Sonoma County General Plan, and as discussed above in item 1(a) with the inclusion of the mitigation measures, the project is consistent with scenic resources policies. Also refer to item 5 (a) in this initial study checklist for mitigation measure to require HD (Historic Combining District) on the eastern portion of the project site to protect the historic value of the existing Hop Kiln and Hop Bale Barn buildings.

Mitigation: Refer to Mitigation Measures under Item 1 (a) and Mitigation Measures under Item 5 (a) in this initial study checklist.

c) Substantially degrade the existing visual character or quality of the site and its surroundings?	Potentially Significant Impact	Less than Significant with	Less than Significant Impact	No impact

		Mitigation Incorporation		
		X	X	

Comment:
1.c. Less Than Significant with Mitigation Incorporated: (**Refer to Mitigation Measures and Monitoring Incorporated into the project under item 1.a. above).** As discussed above, under items 1.a and 1.b, and below, under item 1.d, the project would not be expected to result in a significant impact upon the visual character of the area or its surroundings. Nonetheless, mitigation measures have been incorporated into the project to require joint review by the Design Review Committee and Sonoma County Landmarks Commission after a final decision has been made on the Use Permit request. Implementation of the identified mitigation measures will ensure that potential project effects to visual character will be less than significant.

Mitigation: Refer to Mitigation Measures under Item 1 (a) above.

d) Create a new source of substantial light or glare which would adversely affect day or nighttime view in the area?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
		X		

Comment:
1.d. Less Than Significant With Mitigation Incorporated: The proposed project would create a new source of exterior lighting that may impact nighttime views as seen from Westside Road, the Russian River, wildlife corridors, and surrounding properties.

The Sonoma County General Plan Open Space and Resource Conservation Element contains goals and policies to preserve and maintain views of the night time skies and visual character of urban, rural and natural areas, while allowing for nighttime lighting levels appropriate to the use and location. Policies include:

<u>Policy OSRC-4a</u>: Require that all new development projects, County projects, and signage utilize light fixtures that shield the light source so that light is cast downward and that are no more than the minimum height and power necessary to adequately light the proposed use.

<u>Policy OSRC-4b</u>: Prohibit continuous all night exterior lighting in rural areas, unless it is demonstrated to the decision making body that such lighting is necessary for security or operational purposes or that it is necessary for agricultural production or processing on a seasonal basis. Where lighting is necessary for the above purposes, minimize glare onto adjacent properties and into the night sky.

The proposed winery and tasting room project will add new land uses to the site and thus will introduce permanent new sources of exterior lighting. The proposed exterior lighting plan (Sheets A5.00 & A5.01) prepared by Lundberg Designs, dated April 2015, indicates the new exterior lighting fixtures would be down-casted and will utilize wall mounted sconce fixtures where possible and parking area lighting would be low, bollards with down-casted fixtures. No flood lights are permitted.

The following mitigation measure will be added to the project to ensure that lighting is controlled according to PRMD standards and that impacts will be less than significant.

Mitigation Measure 1.d.: Prior to issuance of building permits for the winery and/or tasting room buildings, an exterior lighting plan shall be submitted to the Design Review Committee and Sonoma County Landmarks Commission for a joint-committee review and approval. Exterior lighting is required to be fully shielded from off-site views, and directed downward to prevent "wash out" onto adjacent properties or the night sky. Generally, fixtures should accept sodium vapor lamps and not be located at the periphery of the property. Flood lights are not allowed. The lighting shall be installed in accordance with the approved lighting plan during the construction phase.

Mitigation Monitoring 1.d.: The Permit and Resource Management Department shall not issue building permits for the winery and/or tasting room buildings until an exterior lighting plan has been reviewed and approved by the Design Review Committee and Sonoma County Landmarks Commission in a joint-committee review, consistent with the above mitigation measures and County standards. The Permit and Resource Management Department shall not sign off temporary or final occupancy on any related Building Permit for the winery or tasting room buildings until a site inspection of the property has been conducted that indicates all lighting improvements have been installed according to the approved plans and conditions. If light and glare complaints are received, the Permit and Resource Management Department shall conduct a site inspection and, if warranted, require that the property be brought into compliance or initiate procedures to revoke the permit.

With implementation of the foregoing mitigation, potential impacts due to new sources of exterior lighting and glare would be reduced to a level of insignificance.

2. AGRICULTURE AND FOREST RESOURCES – Would the project:

a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
				X

Comment:

2 (a). No Impact: The proposed project site contains a mix of designations on the Important Farmlands Map including: Prime farmland on the western side where the commercial vineyard exists, Farmland of Statewide Importance and Unique Farmland along the roadway frontages on both sides of Westside Road, and Grazing land on the eastern side where the new winery building is proposed. Of the 75 acre parcel, approximately 42 acres are currently planted in grapes, of the remaining 33 acres, 3.75 total acres comprises of existing and proposed development, comprising of 5 % of the total parcel size which is not significant as the majority of the total acreage remains in agricultural production (refer to Table 1 below). None of the existing vineyard will be removed to accommodate the proposed uses or site infrastructure.

Table 1: Square footage of surfaced area – 7097 Westside Road

Entrance Roadway (west)	7,660 (gravel)	
Roadway to winery and parking (west)		31,190
Winery Building (west)		19,100
Wine caves (west)		21,250
Entrance roadway (east)	5,595 (gravel)	2,735
Parking and building access (east)		
Chipseal		10,660
gravel	30,360	13,245
Hop kiln (east)	2,930	190
Baling barn (east)	2,090	20
Concrete walkways		920
Total	48,635	**99,310**

The proposed project includes a new winery and wine caves on the west side of Westside Road, and on the east side of Westside Road the re-purposing/refurbishing of two existing hop kiln buildings into tasting rooms and marketing accommodations. The project includes the construction of parking areas, driveways and the enlarging of the existing driveways to meet fire safe standards. The proposal also includes 22 agricultural promotional events with a range of guests (10 events and 30 guests, 5 events with 60 guests, 5 events with 120 guests, and 2 events with 300 guests) and participation in an industry-wide event totaling two (2) day events with a maximum of 300 guests for a total of 24 events. The winery and tasting room uses are considered agricultural related uses in support of the large commercial vineyard and local agricultural industry. The project site would remain devoted to agricultural uses and the project will not result in conversion of farmland or cultivated area to any non-agricultural use.

Mitigation: None required

b) Conflict with existing zoning for agricultural use, or Williamson Act Contract?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
		X		

Comment:

2.b. Less Than Significant Impact with Mitigation Incorporated: The project site is under a Land Conservation contract (Williamson Act contract) and in the LIA (Land Intensive Agriculture) land use and zoning designation. The General Plan policy for Land Intensive Agricultural states that agricultural production, agricultural support uses, and visitor serving uses, as provided in the Agricultural Resources Element of the General Plan, are permitted uses with a Use Permit approval. The project must be found consistent with the General Plan's Agricultural Element Goals, Objectives and Policies, which include the following:

General Plan

Goal AR-1: *"Promote a healthy and competitive agricultural industry whose products are recognized as being produced in Sonoma County."*

Objective AR-1.2: "*Permit marketing of products grown and/or processed in Sonoma County in all areas designated for agricultural use."*

"Policy AR-4a": *The primary use of any parcel within the three agricultural land use categories shall be agricultural production and related processing, support services, and visitor serving uses. Residential uses in these areas shall recognize that the primary use of the land may create traffic and agricultural nuisance situations, such as flies, noise, odors, and spraying of chemicals*."

Staff Analysis: The project site is within the Land Intensive Agriculture General Plan land use designation and the existing primary use of the project site will remain agriculture production with over 50 percent of the project site planted in vineyard. None of the existing vineyard will be removed to accommodate the proposed uses or site infrastructure. The project site is located within the Russian River appellation. To avoid conflicts with residences in the project vicinity, conditions have been incorporated into the proposed project to reduce potential land use conflicts such as exterior lighting, limit on frequency and hours of events, and noise. All exterior lighting shall be low mounted, downward casting and fully shielded to prevent glare. Noise generated by the proposed winery and event activities must be controlled by mitigation measures incorporated into the project under item 11 (Noise) in this initial study checklist in accordance with the standards set in the Noise Element of the General Plan.

"GOAL AR-5: *Facilitate agricultural production by allowing agriculture-related support uses, such as processing, storage, bottling, canning and packaging, and agricultural support services, to be conveniently and accessibly located in agricultural production areas when related to the primary agricultural production in the area*."

Staff Analysis: The project site is 75 acres with 42 acres of existing vineyard consisting of 32 acres planted in Chardonnay grapes and 10.5 acres in Pinot Noir grapes. The winery would process grapes grown on-site, from the local area, and from neighboring Counties. The Pinot Noir grapes are leased to another winery on a long term basis. The 32 acres of Chardonnay grapes will be processed on the site at the proposed winery. The former Chardonnay grape contracts expired by the end of the 2016 harvest. The Project Proposal Statement explains the on-site vineyard produces 250 tons of grapes. The Winery Trip Generation Form prepared by W-Trans, states approximately 720 tons of grapes would be imported to the project site from local areas in order to reach the maximum annual production capacity of 60,000 cases. This calculates to approximately 62 cases/ton, which is consistent with industry standards which range between 58 to 65 cases/ton based on grape variety and processing operations. Previous Use Permits have approved wineries that process grapes from neighboring Counties. In times of drought or other natural disasters (fire or flood), allowing importation of grapes from neighboring Counties is necessary for wineries to continue to operate.

"Objective AR-5.1: *Facilitate County agricultural production by allowing agricultural processing facilities and uses in all agricultural land use categories."*

Staff Analysis: The subject site is designated as Land Intensive Agriculture which is considered one of the primary agricultural land use designations. As discussed above, an on-site winery allows processing of grapes grown onsite, from the local area, and neighboring Counties.

“Policy AR-5a: *Provide for facilities that process agricultural products in all three agricultural land use categories only where processing supports and is proportional to agricultural production on site or in the local area*.”

Staff Analysis: The growing of grapes will continue to be the primary use of the site. Grapes would be processed from the grapes grown on site, from the local area, and from neighboring counties.

“Policy AR-5c: *Permit storage, bottling, canning, and packaging facilities for agricultural products either grown or processed on site provided that these facilities are sized to accommodate, but not exceed, the needs of the growing or processing operation. Establish additional standards in the Development Code that differentiate between storage facilities directly necessary for processing, and facilities to be utilized for the storage of finished product such as case storage of bottled wine. Such standards should require an applicant to demonstrate the need for such on-site storage.”*

Staff Analysis: The above policy relates to limiting the amount of finished product (case good storage) on agricultural zoned lands. The proposed project has case good storage approximately 843 square feet within the tasting room building. The winery and wine cave contain tank storage and barrel storage, respectively, for the aging of the wine which is considered a component of the processing operation. No vines will be removed to accommodate the proposed project.

The applicant expects the tasting room improvements to be completed sooner than the construction of the new winery building and wine cave. A condition will be placed on the project to require the winery building and wine cave be completed one year after the tasting rooms are in full operation to ensure the project site does not convert to stand-alone tasting rooms.

PRMD also requires that office and administration areas do not exceed 15 percent of the square footage of the winery’s production and aging areas to ensure these uses are incidental to the winery. The proposed administration/office area for the entire project is 14 percent of the total winery production facility, consistent with PRMD’s maximum threshold.

“***Policy AR-6a***”: *Permit visitor serving uses in agricultural categories that promote agricultural production in the County, such as tasting rooms, sales and promotion of products grown or processed in the County, educational activities and tours, incidental sales of items related to local area agricultural products, and promotional events that support and are secondary and incidental to local agricultural production*.”

Staff Analysis: Consistent with past approvals for similar projects, the events held at the winery facility would be considered agricultural promotional events. No weddings, receptions, or concerts are proposed. The purpose of the winery holding agricultural promotional events and participating in industry-wide events is to educate consumers on the wine-making process and to increase direct sales and wine club memberships for future wine purchases. Hosting on-site events is a proven marketing tool used for many wineries in a competitive market.

The majority of the site would remain planted in vineyard, no vines will be removed to accommodate the project, and the events would be limited in frequency and size to ensure they remain secondary and incidental to the on-site agricultural production and processing.

Consistent with past approvals, the proposed events would promote wine processed on the site. The LIA (Land Intensive Agriculture) zoning district allows for tasting rooms, subject to the minimum criteria of General Plan Policies AR-6d and AR-6g and approval of a Use Permit.

"***Policy AR-6d***: *Follow these guidelines for approval of visitor serving uses in agricultural areas*:

1. The use promotes and markets only agricultural products grown or processed in the local area."

Staff Analysis: The tasting room use will promote the wine processed on site.

"2. *The use is compatible with and secondary and incidental to agricultural production activities in the area*."

Staff Analysis: The winery and tasting rooms encompass a small portion of the overall project site and considered secondary to the primary use of the project site which is a large commercial vineyard. Of the 75 acre parcel, approximately 42 acres are currently planted in grapes, of the remaining 33 acres, new and existing development area consists of 3.75 acres using information on Table 1 below. No vines will be removed to accommodate the proposed winery building, tasting rooms, or site infrastructure. The existing 2,000 sq. ft. residence; 1,800 sq. ft. barn; 1,800 sq. ft. shed, and existing 3 ½ acre reservoir are existing permitted uses that will remain on the site. They are not part of the discretionary review or subject to CEQA.

"3. *The use will not require the extension of sewer and water*."

Staff Analysis: The use will be served by on-site septic system and water well and extension of sewer and water lines will not be required.

"4. *The use is compatible with existing uses in the area*."

Staff Analysis: There are other wineries, tasting rooms, large commercial vineyards, small family farms and residences in the project vicinity. The tasting room operating hours would be limited and agricultural promotional events are limited per year in size and frequency. Also, the use of amplified music/sound would be indoors only. Amplified sound, music, and the very loud musical instruments (such as horns, drums and cymbals) are not permitted outdoors. The quieter, non-amplified musical instruments (such as piano, stringed instruments, woodwinds, flute, etc) are allowed outdoors in the Picnic Grove, during daytime hours, when in compliance with the Adjusted Noise Element of the Sonoma County General Plan. Agricultural promotional events shall not include of weddings, receptions, or concerts, but shall consist of wine marketing events, wine pairing meals or events promoting a specific aspect of Sonoma County agriculture.

"5. *Hotels, motels, resorts, and similar lodging are not allowed*.'

Staff Analysis: The proposed project does include marketing accommodations which are not considered commercial lodging. Refer to Marketing Accommodation discussion below in the initial study.

"6. Activities that promote and market agricultural products such as tasting rooms, sales and promotion of products grown or processed in the County, educational activities and tours, incidental sales of items related to local area agricultural products are allowed."

Staff Analysis: The project includes public and private tasting rooms, retail sales, agricultural promotional events, and an industry wide event. The purpose for hosting events is to educate consumers on the wine-making process and to increase direct sales and wine club memberships for future wine purchases. Hosting on-site events is a proven marketing tool used for many wineries in a competitive market.

Determining concentration of uses is explained under General Plan Policy AR-5g which states: "*Local concentrations of any separate agricultural support uses, including processing, storage, bottling, canning and packaging, agricultural support services, and visitor-serving and recreational uses as provided in Policy AR-6f, even if related to surrounding agricultural activities, are detrimental to the primary use of the land for the production of food, fiber and plant materials and shall be avoided. In determining whether or not the approval of such uses would constitute a detrimental concentration of such uses, consider all the following factors*:

"1. *Whether the above uses would result in joint road access conflicts, or in traffic levels that exceed the Circulation and Transit Element's objectives for level of service on a site specific and cumulative basis*."

Staff Analysis: Based on the Traffic Analysis prepared by W-Trans, and the review and acceptance of the analysis by the Sonoma County Transportation and Public Works Department (DTPW), project generated traffic would not result in road access conflicts and would not exceed the level of service established in the Circulation and Transit Element's objectives (Refer to further discussion under item 16 Traffic Impacts below in this initial study checklist).

"2. Whether the above uses would draw water from the same aquifer and be located within the zone of influence of area wells".

Staff Analysis: A groundwater availability study was prepared for the project by EBA Engineering. EBA explains the project site is located within a Class1 water area, which is identified as representing a major groundwater basin that is typically characterized by robust groundwater yields.

EBA concludes the water supply characteristics of the underlying aquifer utilized by Wells #1 and #3 are more than adequate to accommodate the water demands associated with the proposed improvements and will not result in negative impacts to local groundwater or surface water resources. This conclusion is based on the following variables:

1) The site is located within a Class 1 water area, which is identified in the Sonoma County General Plan as a major groundwater basin;
2) The underlying aquifer is comprised of alluvial deposits associated with the Russian River, which is a managed water system that ensures perennial flow throughout the year and serves as a continuous source of recharge to the aquifer;
3) Well capacity test results for Well #1 demonstrated a sustainable yield of 45 GPM while only inducing 1.5 feet of drawdown. This is indicative of a highly prolific aquifer system;
4) Based on the yield characteristics of the on-site wells, the wells will only have to pump for less than two hours (Well #1) and six minutes (Well #3) per day to accommodate the peak water flow demands; and
5) The projected radius of influence characteristics induced by the pumping operations will not encroach onto neighboring properties. In addition, the proposed water use is projected to induce no measureable changes in surface water flows in the Russian River.

Further information can be found under Item 9 (b) below in this initial study checklist.

"3. Whether the above uses would be detrimental to the rural character of the area."

Staff Analysis: The project site is 75 acres with 42 acres of existing vineyard. The proposed winery building design and architecture has been reviewed in a joint meeting by the Design Review Committee and the Sonoma County Landmarks Commission with a majority who had no objection to the proposed project design. Existing and proposed landscaping on the site will help screen the building from the public road. The winery building would be setback from Westside Road outside of the scenic corridor and the wine cave is underground and not visible. The existing hop kiln buildings on the east side will remain intact, but will be refurbished with their original architecture remaining the same. A new bridge connecting the two structures will be introduced, but as noted this bridge was once part of the original architecture connecting the uses of the two hop buildings barns. A new parking area and overflow area will be introduced on the east side with new landscaping. This new parking areas are required to meet rural lighting standards. New landscaping will shield new asphalt and paving from Westside Road and should act to blend with the adjacent vineyard. Agricultural production appears to be the primary use of the project site. Other wineries and tasting rooms projects in the vicinity within one-half a mile of the project site are:

Table 1: Approvals in Project Vicinity (within ½ mile)

Winery Name/File					
Williams-Selyem Winery PLP04-0062	7227 Westside Rd APN:110-240-024	Modification 6/2007	35,000 cases	Tasting hours 10AM -5 PM	Yes. 24 annual ag promo events w/110 max. guests per event. Four wine pick weekends/year.
Arista Winery UPE04-0113B	7014 Westside Rd APN:110-240-039	Modification 10/2012	20,000 cases	10 AM – 5 PM	Yes. 15 annual ag promo events w/200 max. guests per event
Gracianna Wines Tasting room-(stand-alone) UPE10-0021	6914 Westside Rd APN: 110-240-011	Modification 3/2014	Not applicable	10 AM – 6 PM April 1 thru November 30th each year	No
Allen Family Vineyards UPE04-0018	6575 Westside Rd APN: 110-240-006	10/2004	16,000 cases Retails sales of wine by appt only	No	No

Gracianna is a stand-alone tasting room not approved for events. Allen Family Vineyards is a winery not approved for a tasting room or events.

*Distance from subject site is measured from existing project site driveway to winery driveway using Google driving directions. ½ mile distance is consistent with recent winery projects before the BZA.

Note: There are two winery related Use Permits on the northern segment of Westside Road, PLP14-0031 denied by the Board of Zoning Adjustments in July 2017 and on appeal to the Board of Supervisors. PLP15-0032, denied by the Board of Zoning Adjustments in August 2017. Both projects are more than five miles from the project site.

Zoning Ordinance:

The project site is zoned LIA (Land Intensive Agriculture). The purpose of LIA is stated as follows: “To enhance and protect lands best suited for permanent agricultural use and capable of relatively high production per acre of land; and to implement the provisions of the land intensive agriculture land use category of the General Plan and the policies of the agricultural resources element.” In the LIA (Land Intensive Agriculture) zoning district, Section 26-04-010(g); allows for processing and preparation of agricultural products. And, Section 26-04-010 (f); allows for:

“Tasting rooms and other temporary, seasonal or year-round sales and promotion of agricultural products grown or processed in the county subject to the minimum criteria of general plan Policies AR-6d and AR-6g. This subsection shall not be interpreted so as to require a use permit for uses allowed by Section 26-04-010(g)”;

Staff analysis: The County has historically found tasting rooms and agricultural promotional events consistent with the agricultural zoning districts, including the LIA zoning district, if the events promote agricultural products grown or processed on the site. In addition, such events can be found compatible with surrounding agricultural activities if the hours, size, and frequency of the events are limited and if there are no substantial noise or traffic impacts as a result of the activities. The project site is located directly off of Westside Road, a County maintained roadway. According to the Traffic Impact Study prepared by W-Trans, the traffic generated by the project would not cause traffic concerns. According to the project engineer, Adobe & Associates, a clear line of sight shall be provided on the west side of Westside Road by trimming trees and terracing/lowering the northwest hillside on the applicants' property along the frontage. In terms of noise, mitigation measures have been incorporated into the project. The tasting room operating hours would be limited and agricultural promotional events are limited per year in frequency, size, and hours. Also, the use of amplified music would be indoors only. Amplified sound, music, and the very loud musical instruments (such as horns, drums and cymbals) are not permitted outdoors. The quieter, non-amplified musical instruments (such as piano, stringed instruments, woodwinds, flute, etc) are allowed outdoors in the Picnic Grove, during daytime hours, when in compliance with the Adjusted Noise Element of the Sonoma County General Plan. Agricultural promotional events shall consist of wine marketing events, wine pairing meals or events promoting a specific aspect of Sonoma County agriculture. The project does not include weddings, receptions, or concerts.

Marketing Accommodations:

The request includes two guest room marketing accommodations. The request for marketing accommodations are consistent with the following Zoning Code section (26-04-020.j):

"1. The use promotes or markets agricultural products grown or processed on the site."

Analysis: The marketing accommodations will provide overnight accommodations for private guests of the winery in conjunction with promoting and marketing the wine processed on the site.

"2. The scale of the use is appropriate to the production and/or processing use on the site."

Staff Analysis: An existing building (hop bale barn) would be used by converting the upper floor to the two guest room marketing accommodations. The existing 2,300 square foot structure would continue to be subordinate to the large commercial vineyard and winery operations.

"3. The use complies with General Plan Policies AR-6d and AR-6f."

Staff Analysis: The above responses regarding tasting room compliance to General Plan Policy AR-6d and AR-6f are applicable to marketing accommodations.

"4. No commercial use of private guest accommodations is allowed."

Staff Analysis: The project description states no public use of the marketing accommodations would be allowed and mitigation requires no reimbursement of any kind is allowed.

"5. Any such use on a parcel under a Land Conservation contract must be consistent with Government Code Section 51200 et seq. (the Williamson Act) and local rules and regulations."

Staff analysis: The property is subject to a Land Conservation Act (Williamson Act) contract. The marketing accommodations contain two guest bedrooms with full bathrooms located on the upper floor of the private tasting room building (Hop Bale Barn). Marketing accommodations are an allowed use under Rule 8.3 (B)-(2) of the local Uniform Rules for Agricultural Preserves. The request for marketing accommodations is consistent with prior approved marketing accommodations as the following wineries through approved Use Permits:

Silver Oak Winery: A residence used for three marketing accommodations, expansion of an existing winery facility to 120,000 cases, a maximum of 25 agricultural promotional event days per year with a range of 50 to 200 guests, and one event day per year with a maximum of 1,000 guests with a limited term of five years is permitted, PLP14-0004; 7370 Highway 128, Healdsburg.

David Coffaro Winery: One marketing accommodation attached to a wine storage building, maximum annual production capacity of 7,000 per year, UPE94-931 & UPE99-0031; 7485 Dry Creek Rd., Geyserville, APN 139-130-031.

Lambert Bridge Winery: Two detached marketing accommodations, maximum annual production capacity of 30,000 per year, UPE02-0063; 4085 W. Dry Creek Rd., Healdsburg, APN 090-130-022.

Silver Oaks Cellars: Three marketing accommodations attached to the winery, maximum annual production capacity of 65,000 per year, UPE93-0070; 24625 Chianti Rd, Geyserville, APN 118-070-012.

Jordan Vineyard and Winery: Two marketing accommodations attached to the winery, maximum annual production capacity of 250,000 per year, PLP00-0034; 1474 Alexander Valley Rd., Healdsburg, APN 091-030-043.

Hartford Family Winery: Three marketing accommodations attached to the tasting room, maximum annual production capacity of 60,000 per year, UPE00-0122; 8075 Martinelli Rd., Forestville, APN 083-200-053.

Palm Drive Vineyards/Scribe Winery: Four marketing accommodations attached to the tasting room, maximum annual production capacity of 150,000 per year, PLP09-0010; 2300 Napa Rd., Sonoma, APN 126-101-034.

Agricultural Promotional Events:

The request is consistent in scale with other projects, especially due to the large production.
Currently, the Zoning Ordinance does not limit the number of agricultural promotional events allowed on agricultural zoned parcels. Using the Winery Database prepared by PRMD staff, the average number of approved events at wineries in Sonoma County is 20 and the average number of guests per an event is 50.

The County has approved similar projects where it was found that the agricultural promotional events, if limited in frequency, size, and hours, are compatible with the agricultural zoned land because such events are a marketing tool to insure the long term viability of wine sales and promote the long-term viability of agriculture in the county. Here, the specific circumstances with this particular application include a determination that the project would not have traffic impacts, change the level of service, or create traffic hazards with mitigations to meet sight distance standards, or cause a drawdown of wells in the area. Mitigation measures have been incorporated into the project to reduce potential exterior lighting under item 1 (Aesthetics), reduce potential noise impacts under item 11 (Noise), and reduce potential impacts under item 16 (Traffic hazard) impacts in this initial study checklist.

Permit Sonoma requires that office and administration areas not exceed 15 percent of the square footage of the winery's production, storage and tasting areas. The proposed administration area for the proposed project is at 14 percent of the total winery facility (refer to Sheet A1.13).

Land Conservation Contract:

The project site is under a prime Land Conservation Contract (Williamson Act contract) recorded in 2007 (Ag. Preserve 1-397; OR# 2007-037936). In order to comply with the contract, land must meet the following standards of the Sonoma County Uniform Rules:

1) The land must be devoted to an agricultural or open space use as defined in the Williamson Act. The County has required at least 50% of the land be devoted to agriculture or open space use to meet this standard.

Staff Analysis: The project site is 75 acres with 42 acres planted in vineyard. The property meets the 50% threshold. Since the mid-1800s this property has been in agriculture: fruit orchards, hops, and now grapes. In 1988, this property operated as a pumpkin patch and farm store until 2000. Wine grapes were planted in 1990 and the vineyard currently produces approximately 250 tons of grapes annually, consisting of approximately 15,000 cases. Approximately, 750 tons of grapes, which calculates to 45,000 cases, would have to be imported to the project site to reach the maximum annual production capacity of 60,000 cases.

2) The land must have a minimum parcel size of 10 acres for a Type 1 or 40 acres for a Type 2 contract.

Staff Analysis – The property is 75 acres and under a prime (Type I) contract.

3) Compatible uses may be permitted provided that they are incidental to the primary use of the land for agriculture, listed in the County's Uniform Rules for Agricultural Preserves and meet the criteria for compatibility.

Staff Analysis – Under the Uniform Rules, the following are listed as compatible uses: winery, tasting rooms, including the marketing accommodations, and the existing primary residence to remain on the project site. Under the Uniform Rules, the existing barn, existing storage shed/canopy, and existing reservoir, used for the vineyard irrigation, are considered accessory agricultural structures under Rule B.8 and B.9, respectively. Incidental has been defined by the County to mean compatible uses may collectively occupy no more than 15 percent of the land area or five acres whichever is less.

Table 1: Square footage of surfaced area – 7097 Westside Road

Entrance Roadway (west)	7,660 (gravel)	
Roadway to winery and parking (west)		31,190
Winery Building (west)		19,100
Wine caves (west)		21,250
Entrance roadway (east)	5,595 (gravel)	2,735
Parking and building access (east)		
Chipseal		10,660
gravel	30,360	13,245
Hop kiln (2 structures)	2,930	190
Baling barn	2,090	20
Concrete walkways		920
Total	48,635	**99,310**

For the 75 acres parcel size, the 5 acre threshold would apply. Of the 75 acre parcel, approximately 42 acres are currently planted in grapes, of the remaining 33 acres, the total area consists of 3.40 acres for existing and new development area (147,945 square feet), using information on Table 1 above. The existing primary residence and area consists of approximately .35 acres. In total, the compatible uses comprise of 3.75 acres of the 75 acre parcel, meeting the threshold. No vines will be removed to accommodate the proposed project. The winery, tasting rooms, existing residence and the related infrastructure and improvements encompass approximately a small portion, approximately 5%, of the overall project site and considered secondary to the primary use of the project site which will remain a large commercial vineyard. The majority of the project site will remain in agricultural production.

"Compatible Use" is defined as any use determined by the county or city administering the preserve pursuant to sections 51231, 51238 or 51238.1 or by this act to be compatible with the agricultural, recreational, or open space use of land within the preserve and subject to contract. In addition, Section 51220.5 states that "cities and counties shall determine the types of uses to be deemed compatible in a manner which recognizes that a permanent or temporary population increase hinders or impairs agricultural operations."

The County's Uniform Rules list agricultural promotional events as a "compatible use" for land under an agricultural contract under the following circumstances:

- When directly related to agricultural education or the promotion or sale of agricultural commodities and products produced on the contracted land, and,
- Events last no longer than two consecutive days and do not provide overnight accommodations, and,
- No permanent structure dedicated to events is constructed or maintained on the contracted land.

The proposed events are considered agricultural promotional events according to the current County interpretation and broken down into two categories by the applicant:

- Agricultural Promotional marketing events, include the wine club dinners, food and wine pairing, wine releases, barrel tasting.
- Industry-wide events

Staff Analysis: Events would not last longer than two consecutive days. No lodging is provided, except for marketing accommodations which are for private guests of the winery without any exchange of monetary compensation. No permanent structures just devoted to event-use would be constructed as part of the project. The agricultural promotional events and industry-wide events would take place inside the public and private tasting rooms or in the Walnut Grove.

The project must also be found consistent with the state law of the Land Conservation Act (Williamson Act). The following analysis addresses the findings required by the applicable Sections of the Land Conservation Act.

Section 51201 (e) of the Land Conservation Act defines "Compatible Use" as any use determined by the county or city administering the preserve pursuant to sections 51231, 51238 or 51238.1 or by the Act to be compatible with the agricultural, recreational, or open space use of land within the preserve and subject to contract. In addition, Section 51220.5 states that "cities and counties shall determine the types of uses to be deemed compatible in a manner which recognizes that a permanent or temporary population increase hinders or impairs agricultural operations."

Staff Analysis: Consistent with Section 51220.5, the County's Uniform Rules consider agricultural promotional events and industry-wide events compatible uses in association with an on-site agricultural use because they are a marketing tool for sales of an agricultural product and promote the long-term viability of agriculture within the county. Events require a Use Permit which limit the frequency and size (# of guests) of events, limit hours, and incorporate conditions into the Use Permit to prevent conflicts with on-site and surrounding agricultural operations.

Section 51238.1 of the Williamson Act states, “Uses approved on contracted lands shall be consistent with all of the following principles of compatibility:

(1) The use will not significantly compromise the long-term productive agricultural capability of the subject contracted parcel or parcels or on other contracted lands in agricultural preserves.

(2) The use will not significantly displace or impair current or reasonably foreseeable agricultural operations on the subject contracted parcel or parcels or on other contracted land in agricultural preserves.

(3) The use will not result in the significant removal of adjacent contracted land from agricultural or open-space use.

Staff analysis: The proposed use is a winery to process grapes grown on the site and from the local area. No vines would be removed to accommodate the project development. The agricultural promotional events or industry wide events do not compromise agricultural capability because they are marketing tools to help sell wine produced on site and ensure the long term viability of the vineyard and winery. The proposed agricultural promotional events are limited in frequency and size and held in the afternoon and evening hours and would not conflict with a majority of the on-site agricultural activities which occur in the early morning hours. To the north of the proposed project site there are two parcels and to the south is one parcel under Land Conservation Act contracts. These are also commercial vineyard properties along Westside Road. Adjacent to the project site are four parcels also planted in vineyard and under a Land Conservation Act contract.

In summary the LIA General Plan and Zoning designations and the Uniform Rules for Land Conservation Act contracts allows for wineries and tasting rooms. The scale and location of the proposed winery and tasting facility are consistent with applicable General Plan Agricultural Resource Element objectives and policies, specifically Objective AR-1.2: Permit marketing of products grown and/or processed in Sonoma County in all areas designated for agricultural use. The proposed project does not conflict with existing zoning for agricultural use, or Land Conservation Act contract (Williamson Act Contract) with mitigation incorporated into the project below:.

Mitigation Measure 2.b: The two guest room marketing accommodations located on the upper floor of the private tasting room (hop bale barn) shall not be used for commercial purposes, including, but not limited to, transient occupancy, vacation rental, hosted vacation rental, or farm stay; and a form of monetary compensation shall not be accepted or exchanged. The marketing accommodations are limited to use by private guests of the winery operator or the winery owners.

Mitigation Monitoring 2.b.: If the Permit and Resource Management Department receives a complaint that the marketing accommodations are being used for occupancy beyond private guests of the winery operator or the winery owners, PRMD staff shall investigate the complaint and if the condition is violated the Use Permit may be subject to modification or revocation.

c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 4526) or timberland zoned Timberland Production (as defined by Government Code Section 51104(g)?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
				X

Comment: **2.c. No Impact:** The project site is zoned Land Intensive Agriculture (LIA) and is not located in a zoning district which is intended for forest land protection or timberland production. The project would not cause the rezoning of this or any other property currently in forestland protection or timberland production zoning.				
Mitigation: None required				
d) Result in the loss of forest land or conversion of forest land to non-forest use?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
				X
Comment: **2.d No Impact:** The project will not convert existing forestland to a non-forest use.				
Mitigation: None required				
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of farmland, to non-agricultural use or conversion of forest land to non-forest use?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
				X
Comment: **2.e No Impact:** The project does not involve other changes in the environment that could result in conversion of farmland to non-agricultural use or forest land to non-forest use.				
Mitigation: None required				

3. AIR QUALITY – Would the project

Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations.

a) Conflict with or obstruct implementation of the applicable air quality plan?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
			X	
Comment: **3. a. Less than Significant:** The project is within the jurisdiction of the Northern Sonoma County Air Pollution Control District (NSCAPCD). The NSCAPCD does not have an adopted air quality				

plan because they are in attainment for all federal and state criteria pollutants, although the District occasionally exceeds state standards for PM10. It is anticipated that the proposed new winery including the tasting room would have a total of 15 employees, each generating an average of three trips per day. Truck traffic associated with winery operations is expected to consist of five trips per day, on average. An average of 52 visitors per day is expected for tasting, generating 42 trips daily assuming average vehicle occupancy of 2.5 visitors per vehicle. The proposed project is anticipated to generate an average of 92 vehicle trips per day.

The project also includes provisions for a total of 22 agricultural promotional events (including 10 events with 30 guests in attendance, five 60-guest catered events, five 120-guest events) and two industry wide events with 300-person event would require a staff of 14. Using an occupancy of 2.5 vehicles per guests and solo occupancy for staff, a maximum sized event would be expected to generate 254 trip ends at the driveway, including 127 inbound trips at the start of the event and 127 outbound trips upon conclusion. The project proposal statement and traffic study prepared for the proposed project states that in 1988 Westside Farms, the previous use of this site, operated as a diversified agricultural operation with a pumpkin patch and farm store with hay rides starting in 1989. Initially, during the mid-1990’s Westside Farms was open five to six days each week from May through November. After that they were open to the public seven days a week during the month of October. Weekdays were focused on school groups totaling 200-400 children plus parents arriving in school buses and car pools, with an additional 100-200 children arriving after school. Weekends would see 300 to 1000 cars arriving over the course of a day with 400-600 maximum people on site at any one time. At any given moment, 200-300 cars might have been parked on site. In 1990, wine grapes were planted. The vineyard currently produces approximately 250 tons of grapes annually. Westside Farms transferred ownership in 2012. The traffic engineer from W-Trans opines in the traffic study the prior use generated substantially more event traffic during the month of October than the currently proposed project will generate over the course of an entire year.

Given the conclusions of the project traffic study (estimated to be an average 92 trips per day, and 254 event trip ends on a peak day) relative to the screening criteria, ozone precursor emissions would be less than significant. (See Transportation section of this Initial Study).

Mitigation: None required

b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
		X		

Comment:
3.b Less than Significant with Mitigation Incorporated: State and federal standards have been established for “criteria pollutants“: ozone, carbon monoxide, sulfur dioxide and particulates (PM10 and PM2.5). The pollutants NOx (nitrogen oxides) and hydrocarbons form ozone in the atmosphere in the presence of sunlight. Significance thresholds for ozone precursors, carbon monoxide and particulates have been established by the Bay Area Air Quality Management District (BAAQMD).

The principal source of ozone precursors is vehicle emissions, although stationary internal combustion engines must also be considered. BAAQMD generally does not recommend detailed NOx and hydrocarbon air quality analysis for projects generating less than 2,000 vehicle trips per day. Given the low traffic generation of the project (estimated to be an average 26 net trips per day, and 48 net trips on a peak day) relative to the screening criteria, ozone precursor emissions would be less than significant.

Detailed air quality analysis for carbon monoxide is generally not recommended unless a project would generate 10,000 or more vehicle trips a day, or contribute more than 100 vehicles per hour to intersections operating at LOS D, E or F with project traffic. This project would not generate 10,000 or more vehicle trips per day and based on the information in the Traffic Study prepared by W-Trans, Westside Road is not operating at a level of service of LOS D, E, or F even with project traffic. Wood smoke from fireplaces and wood stoves are sources of pollutants receiving increasing scrutiny and generating numerous complaints to local air districts. Although constituting a very small percentage of the total PM10 emissions on an annual basis, wood smoke is a major contributor to reduced visibility and reduced air quality on winter evenings in both urban and rural areas. Sonoma County building regulations restrict fireplaces to natural gas fireplaces, pellet stoves and EPA-Certified wood burning fireplaces or stoves. With the restriction on fireplace design, this would be a less than significant impact.

Though the project may require limited grading for the establishment of the parking area(s), the project will generate temporary, minor amounts of dust (which includes PM10) during project construction. PM10 is a criteria pollutant that is closely monitored under the BAAQMD air quality plan. The BAAQMD requires projects to prevent construction-related emissions of dust through the implementation of best management practices (BMPs), which will be required by Sonoma County as conditions of approval as part of its standard plan review and permitting procedures.

In addition, site investigations revealed the presence of serpentinite on the site, and serpentinite may contain asbestos fibers. Grading on the site, including grading and excavation for the wine cave structures, is under County jurisdiction. While a mined cave would fall under the jurisdiction of the State Department of Conservation, this wine cave structure is not mined, it is being constructed with cut-and-cover excavation and grading with permitting authority under the County of Sonoma’s Building Official within the Permit and Resource Management Department.

It is standard practice in Sonoma County to rely upon compliance with BAAQMD’s naturally occurring asbestos program and ARB ATCM (air toxic control measure) 93105 to avoid impacts from naturally occurring asbestos during construction and grading; this compliance has been used by the County and by agencies such as the Regional Water Board to avoid impacts from naturally occurring asbestos.

To ensure emissions of construction-related dust would be less than significant, the following dust control mitigation measure has been incorporated into the project:

Mitigation Measure 3.b. (1) : NOTE ON ALL GRADING, BUILDING, AND IMPROVEMENT PLANS:

“The Permit Holder shall be responsible for controlling dust and debris during all construction phases. Consistent with BAAQMD guidance, the following measures shall be implemented by the permit holder on the project site during the construction period:

a. Water all active construction areas at least twice daily

b. Cover all trucks hauling soil, sand, and other loose materials or require all trucks to maintain at least two feet of freeboard.

c. Pave, apply water three times daily, or apply (non-toxic) soil stabilizers on all unpaved access roads, parking areas and staging areas at construction sites.

d. Sweep daily (preferably with water sweepers) all paved access roads, parking areas and staging areas at construction sites.

e. Hydro-seed or apply (non-toxic) soil stabilizers to inactive construction areas.

f. Enclose, cover, water twice daily or apply (non-toxic) soil binders to exposed stockpiles dirt, sand, etc.

g. Limit traffic speeds on unpaved access roads to 15 mph.

h. Install sandbags or other erosion control measures to prevent silt runoff to public roadways.

i. Replant vegetation and ground cover in disturbed areas as quickly as possible. The Permit Holder shall be responsible for controlling dust and debris during all construction phases."

Mitigation Monitoring 3.b. (1): If dust complaints are received, PRMD staff shall conduct an on-site investigation. If it's determined by PRMD staff that complaints are warranted, the Permit Holder shall implement greater or additional dust control measures as determined by PRMD or PRMD may issue a stop work order.

Mitigation Measure 3.b. (2) .: NOTE ON ALL GRADING, BUILDING, AND IMPROVEMENT PLANS:
"The permit holder shall also be responsible for complying with provisions to avoid any impacts of naturally occurring asbestos. Prior to any construction or grading, further sampling of soil shall be conducted to verify whether naturally occurring asbestos is present. If naturally occurring asbestos is encountered, the project applicant shall prepare an asbestos dust mitigation plan that complies with the Airborne Toxic Control Measures required by 17 California Code of Regulations, Section 93105 and the provisions of the BAAQMD. These provisions require, but not limited to, such measures as limiting construction vehicle speeds to 15 miles per hour, wetting the site prior to and during grading, wetting or covering stockpiles, and washing equipment."

Mitigation Monitoring 3.b. (2): If dust complaints are received, PRMD staff shall conduct an on-site investigation. If it's determined by PRMD staff that complaints are warranted, the Permit Holder shall implement greater or additional dust control measures as determined by PRMD or PRMD may issue a stop work order.

c) Result in a cumulatively considerable net increate of any criteria pollutant for which the project region is non-attainment under an applicable Federal or State ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
		X		

Comment:
3.c. Less than Significant with Mitigation Incorporated: (Refer to discussion and mitigation measures in item 3 b. above). The Bay Area is a non-attainment area for ozone and PM10 (fine particulate matter). The project will not have a cumulative effect on ozone because it will not generate traffic which would result in significant new emissions of ozone precursors (hydrocarbons and Nox). (See response to 3(b) above). The project will have no long-term effect on PM10, because all surfaces will be paved or landscaped, and dust generation will be insignificant. However, there could be a significant short-term emission of dust (which would include PM10) during construction. These emissions could be significant at the project level, and would also contribute to a cumulative impact. The impact could be reduced to less than significant by including dust control measures as described in response to item 3(b) above.

Mitigation: Refer to mitigation measure as listed under item 3(b) above

d) Expose sensitive receptors to substantial pollutant concentrations?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
			X	

Comment:
3.d Less than Significant Impact. There are sensitive receptors in the general project vicinity, consisting of single family residences located south of the project site. However, the project will not generate substantial long-term pollutant concentrations, and mitigation has been included above (under item 3.b.) to address any short-term potential impacts related to dust generation during construction and management of grape pomace (under item 3.e below). The vineyard operations and dust generated by the vineyard operations is not subject to CEQA.

Mitigation: Refer to mitigation measure as listed under item 3(b) above

e) Create objectionable odors affecting a substantial number of people?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
			X	

Comment:
3.e. Less than Significant Impact: See discussion above under item 3(d). Construction will be limited to the removal of two on-site residential structures, the construction of a new 23,000 sq. ft. winery building with associated caves, the refurbishing of two hop kiln structures and associated grading and parking and landscaping improvements. Construction equipment may generate odors during project construction. The impact would be limited in duration (construction only) and would be located a considerable distance from land uses that accommodate substantial number of people. The applicant will be required to secure both demolition and grading permits from PRMD, which will contain provisions for dust control as part of the permit issuance.

In addition, wineries seasonally generate odors associated with the crushing and fermenting of fruit. These odors are relatively short-term and mild. Local Air Board’s typically receive complaints about winery odors only when grape residues (pomace) is burned. However, the processing of grapes requires the long-term management of grape residues. The applicant intends to disc the grape pomace back into the soil on all his parcels. To reduce potential odor impacts caused by grape residue to a less-than significant level, the following standard condition has been incorporated into the project as follows:

Mitigation Measure 3.e. If pomace is to be disposed of, it shall be disposed of in a manner that does not create a discharge to surface water, or create nuisance odor conditions, or attract nuisance insects or animals, according to the following priority:

1. Pomace shall be composted and land applied, or land applied and disced into the soil on vineyards or agricultural land owned or controlled by the applicant.

2. Pomace shall be sold, traded or donated to willing soil amendment or composting companies that prepare organic material for use in land application.

3. Pomace shall be transported to any County's composting facility in a fashion that allows the pomace to be used by the County's composting program.

Pomace shall not be disposed of into the County solid waste landfill by direct burial, except where all possibilities to dispose according to priorities 1 through 3 above have been exhausted. In all cases, care shall be taken to prevent contamination of pomace by petroleum products, heavy metals, pesticides or any other material that renders pomace unsuitable for composting with subsequent land application. Land application, placement of pomace into a composting facility or disposal shall occur within two weeks of the end of wine grape crush.

Mitigation Monitoring 3.e. If the Permit and Resource Management Department receives complaints regarding objectionable odors from pomace stockpiling and/or disposal, PRMD staff would investigate the complaint and if the condition is violated the use permit may be subject to modification.

With implementation of the foregoing standard condition, project impacts associated with the creation of objectionable odors would be less than significant.

4. BIOLOGICAL RESOURCES - Would the project:

a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
		X		

Comment;

4.a. Less than Significant Impact with Mitigation Incorporated: The proposed project includes a new winery and wine caves on the west side of Westside Road, and on the east side of Westside Road will involve the re-purposing/refurbishing of the existing 1949 hop kiln into a tasting room and the refurbishing of the 1949 baling barn into a marketing facility, including the construction of additional parking, driveways and the enlarging of the existing driveways in order to meet fire safe standards. The proposal also includes 24 agricultural promotional events with a range of guests (10 events and 30 guests, 5 events with 60 guests, 5 events with 120 guests, and 2 events with 300 guests) and participation in industry-wide events totaling two day events with a maximum of 300 guests. There are no weddings planned nor will the facility be rented out to third parties. Of the 75 acre parcel, approximately 42 acres are currently planted in grapes, of the remaining 33 acres, 3.47 (150,942 sq. ft.) are proposed for development.

A Habitat Assessment, dated June 24, 2014, prepared by Wildlife Research Associates and Jane Valerius Environmental Consulting in response to the proposed project. According to the Habitat Assessment, three vegetation community types occur within the project area: Quercus agrifolia woodland alliance or coast-live oak woodland; ruderal non-native grassland; and landscaped areas. The majority of the parcel consists of existing vineyards adjacent to the project area, but they are not part of the proposed project development, nor is a grove of Northern California black walnut trees, which is located in the eastern portion of the property near the Russian River. No development is proposed for the black walnut grove other than the placement of some picnic tables which would not impact the trees or the non-native grassland understory. A pond is located on the west side of the property (west side of Westside Road) and is within the property boundary, but will not be impacted by development. The pond does support some willow, and other riparian vegetation.

The Habitat Assessment evaluated the potential for occurrence of 58 special-status plant species, and 26 special-status wildlife species. Surveys for special status plants were conducted on April 28 and May 12, 2014, which covered the flowering period for all of the special status plants that have potential to occur within the project area based on the presence of potential habitat. Relative to the plant species those species that occur in freshwater marshes and swamps, riparian scrub, broadleaf upland forest, chaparral, cismontane woodland, closed-cone coniferous forest, vernal pools, bogs and fens, coast scrub, meadows and seeps, North Coast coniferous forest, coastal prairie, coastal bluff scrub or plants that occur on serpentine or other substrates not occurring within the project area were considered to not have the potential to occur. Species associated with valley and foothill grassland could potentially occur on the site, but none of these species were observed during surveys in April and May, the appropriate times for special status plant surveys. The property on the east side of the Westside Road was previously a pumpkin patch and a farm store starting in 1990 and then became vineyards. The property on the west side has been a residence with landscaped yard and garden. The grassland communities in the project area are highly disturbed and dominated by weedy, non-native species. The assessment concluded that no special-status plants are likely to occur within the proposed project area and none were observed.

According to the habitat assessment, of the 20 special-status animal species identified as potentially occurring in the project vicinity, including within a 3 mile radius, several additional species were evaluated for their potential to occur within the study area based on review of California Natural Diversity Database, the “Special Animals” lists on the California Department of Fish and Wildlife, and the habitat present of the project site. Appendix C of the Habitat Assessment lists the 26 species evaluated by the biologist. Several species were evaluated for their high potential to occur at the project site, including the California red-legged frog, Western pond turtle, Foothill yellow-legged frog, Nestling Passerines, Nestling Raptors and roosting bats.

Western Pond Turtle

Although no western pond turtle was observed in the reservoir at the time of the 2014 survey, or subsequent surveys in 2015 and 2016, there is suitable aquatic habitat present that may be occupied in the future. The surrounding unplanted areas may be suitable habitat for upland nesting habitat in the future. To protect the western pond turtle and its habitat, buffer zones around the existing reservoir have been incorporated into the project as mitigation measures (refer below).

Surveys for wildlife were also conducted and the exterior surfaces and grounds, the interior surfaces of all buildings on the east side proposed for removal and/or refurbishment were surveyed for signs of past or present use by bats. All interior building spaces were examined, including the attic spaces. The project site was also examined for suitable bird nesting habitat.

The assessment found that several passerine (perching birds) species were observed on site, such as the California towhee and scrub jays, build stick nests in trees and shrubs, while others, such as the white-breasted nuthatch and chestnut backed chickadee, nest in tree cavities. Disturbance during nesting season (February 15 to August 15) may result in potential nest abandonment and mortality of young, which is considered a “take of an individual. However, many of these species observed on site were fledged juveniles from the current year, which means that nesting season had concluded in the project area. However, the assessment outlines the several mitigation measures that should be adhered to in order to avoid impacts to passerines and raptors that may potentially nest in the trees.

Relative to mammals, the assessment found that the renovation of buildings may cause direct mortality of roosting bats that use the structures, if the structures are removed during seasonal periods on inactivity (maternity season or winter), or without first conducting humane bat eviction or partial dismantling under supervision of a qualified bat biologist experienced with bats using man made roosts. All existing structures were investigated for the presence of bats:

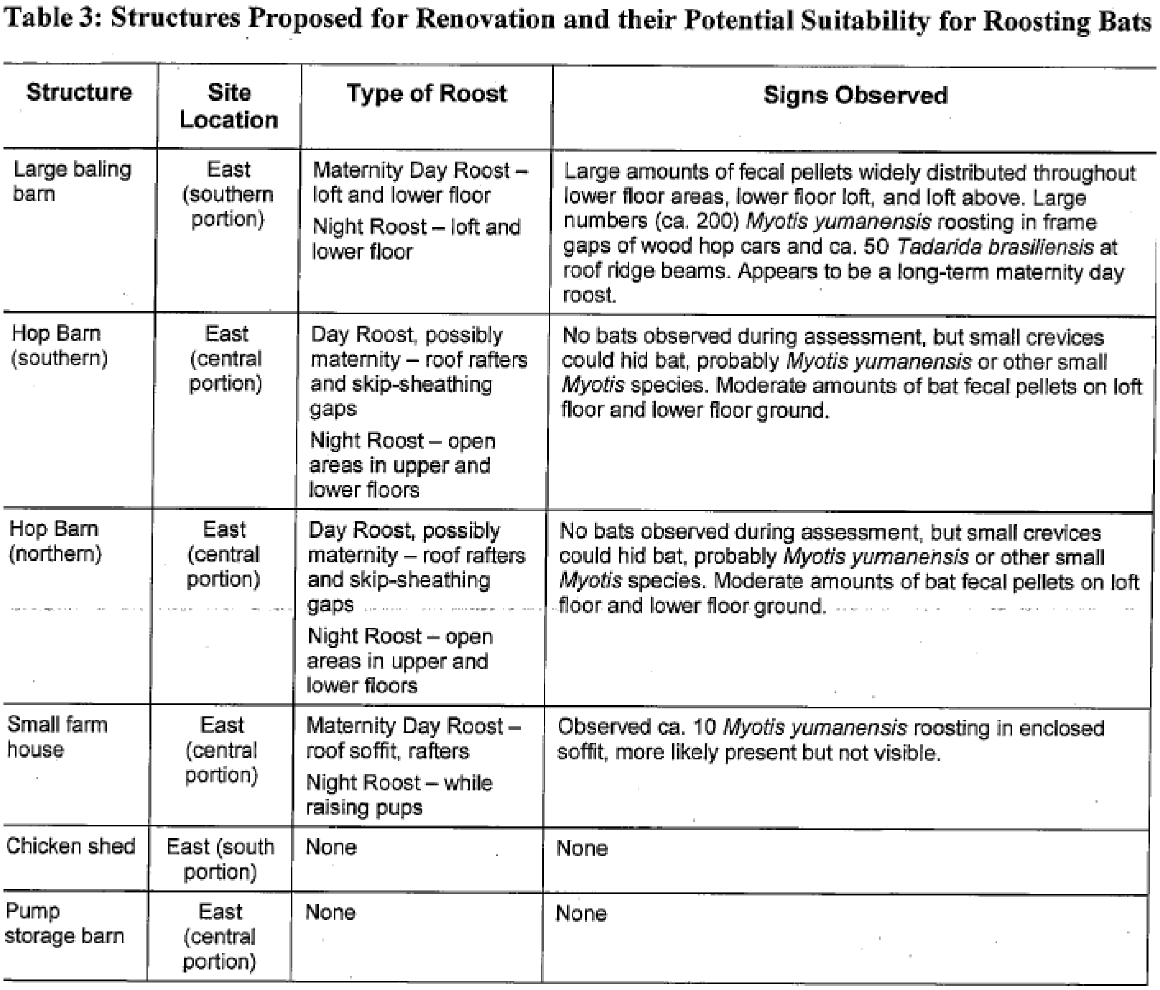

Table 3: Structures Proposed for Renovation and their Potential Suitability for Roosting Bats

Structure	Site Location	Type of Roost	Signs Observed
Large baling barn	East (southern portion)	Maternity Day Roost – loft and lower floor Night Roost – loft and lower floor	Large amounts of fecal pellets widely distributed throughout lower floor areas, lower floor loft, and loft above. Large numbers (ca. 200) *Myotis yumanensis* roosting in frame gaps of wood hop cars and ca. 50 *Tadarida brasiliensis* at roof ridge beams. Appears to be a long-term maternity day roost.
Hop Barn (southern)	East (central portion)	Day Roost, possibly maternity – roof rafters and skip-sheathing gaps Night Roost – open areas in upper and lower floors	No bats observed during assessment, but small crevices could hid bat, probably *Myotis yumanensis* or other small *Myotis* species. Moderate amounts of bat fecal pellets on loft floor and lower floor ground.
Hop Barn (northern)	East (central portion)	Day Roost, possibly maternity – roof rafters and skip-sheathing gaps Night Roost – open areas in upper and lower floors	No bats observed during assessment, but small crevices could hid bat, probably *Myotis yumanensis* or other small *Myotis* species. Moderate amounts of bat fecal pellets on loft floor and lower floor ground.
Small farm house	East (central portion)	Maternity Day Roost – roof soffit, rafters Night Roost – while raising pups	Observed ca. 10 *Myotis yumanensis* roosting in enclosed soffit, more likely present but not visible.
Chicken shed	East (south portion)	None	None
Pump storage barn	East (central portion)	None	None

Mitigation measures are provided to address roosting bats. Adherence to the prescribed mitigation measures for birds and mammals will reduce the impacts to such to less than significant.

On the east side of the property is a grove of Northern California black walnut trees adjacent to the Russian River. The biologist explains that black walnut trees are not truly endemic or native which means they do not qualify as special status. The project proposal explains that outdoor events will be held under the grove on a seasonal basis and picnic tables will be placed in this area. The biologist concludes the proposed uses would not have an adverse impact upon the grove.

The site's base zoning district is (LIA) Land Intensive Agriculture District, where its purpose is to enhance and protect lands best suited for permanent agricultural uses and capable of relatively high production per acre of land; and to implement the provisions of the land intensive agriculture land use category of the General Plan and the policies of the Agricultural Resources Element. The site also contains an (RC) Riparian Corridor Combining Zone, to protect riparian ecological functions; (VOH) Valley Oak Habitat Combing District Combining District, for the purpose of protecting and enhancing valley oaks and valley oak woodlands; and a Floodplain (F1) and (F2) Combing Districts, for the purpose of providing protection from hazards and damage which may result from flood waters. As noted above, drainages were identified on site, but based on the design of the project, these will be avoided.

Mitigation Measure 4.a. 1. NOTE ON ALL GRADING, BUILDING, AND IMPROVEMENT PLANS**:** "To avoid or minimize potential impacts to passerines and raptors that may potentially nest in the trees**,** the following requirements shall be implemented during all stages of project development and construction:

1. Grading or removal of nesting trees should be conducted outside the nesting seasons, which occurs between approximately February 15 and August 15.

2. If grading between August 15 and February 15 is infeasible and groundbreaking must occur within the nesting season, a pre-construction nesting bird (both passerine and raptor) survey of the grasslands and adjacent trees shall be performed by a qualified biologist within 7 days of ground breaking. If no nesting birds are observed no further action is required and grading shall occur within one week of the survey to prevent "take" of individual birds that could begin nesting after the survey.

3. If active bird nests (either passerine and/or raptor) are observed during the pre-construction survey, a disturbance free buffer zone shall be established around the nest trees until the young have fledged, as determined by a qualified biologist.

4. The radius of the required buffer zone can vary depending on species, (i.e., 75-100 feet for passerines and 200-300 feet for raptors), with the dimensions of any required buffer zones to be determined by a qualified biologist in consultation with CDFW.

5. To delineate the buffer zones around a nesting tree, orange construction fencing shall be placed at the specified radius from the base of the tree within which no machinery or workers shall intrude.

6. After protective construction fencing is in place around the buffer zones, there will be no restrictions on grading or construction activities outside the prescribed buffer zones."

Mitigation Monitoring 4.a.1: PRMD staff shall ensure that the above mitigation measures are listed on all grading, building and improvement plans, prior to issuance of grading or building permits. Failure by the applicant to comply with the above requirements may result in a revocation or modification of the Use Permit.

Mitigation Measure 4.a. 2.: NOTE ON ALL GRADING, BUILDING, AND IMPROVEMENT PLANS**:** "To prevent direct mortality of bats that may roost in tree cavities, crevices, exfoliating bark, or foliage of the trees identified on the site, the following requirements shall be implemented during all stages of project development and construction:

1. Potential habitat trees shall be removed only between approximately March 1 or when evening temperatures are above 45° F and rainfall less than ½ " in 24 hours occurs, and April 15, prior to parturition of pups. The next acceptable period is after pups become self-sufficient (September 1 through October 15), or prior to evening temperatures dropping below 45°F and onset of rainfall greater than ½" in 24 hours.

2. Tree removal shall be conducted using a two-stage process over two consecutive days. With this method, small branches and small limbs containing no cavity or crevice or exfoliating bark habitat on habitat trees, as identified by a qualified bat biologist are removed first on day 1, using chainsaws only (no dozers, backhoes, etc.). The following

day (Day 2), the remainder of the tree is to be removed. The disturbance caused by chainsaw noise and vibrations, coupled with physical alteration, has the effect of causing colonial bat species to abandon the roost tree after nightly emergence for foraging. Removing the tree the next day prevents re-habitation and re-occupation of the altered tree.

3. Trees containing suitable potential habitat must be trimmed with chainsaws on Day 1 under initial field supervision by a qualified bat expert to ensure that the tree cutters fully understand the process, and avoid incorrectly cutting potential habitat features or trees. After tree cutters have received sufficient instruction.

4. All other vegetation other than trees within the Limit of Work should be removed prior to tree removal, according to the dates provided above. If vegetation must be removed outside those dates, a 50-ft buffer around each habitat tree should be observed to reduce likelihood of abandonment of the roost and young.

5. If non-habitat trees must be removed outside seasonal periods of bat activity as described above, a 50-ft. buffer around each habitat tree shall be observed to reduce likelihood of abandonment of the roost and young.

6. In order to minimize potential take of solitary bats, tree removal should begin with small trees and vegetation on the site, followed by smaller trees in each location where trees are to be removed. Only chainsaws should be used, to create a noise disturbance that will be sufficient to cause roosting individual to abandon the site.

Mitigation Monitoring 4.a.2: PRMD staff shall ensure that the above mitigation measures are listed on all grading, building and improvement plans, prior to issuance of grading or building permits. Failure by the applicant to comply with the above requirements may result in a revocation or modification of the Use Permit.

Mitigation Measure 4.a. 3.: NOTE ON ALL GRADING, BUILDING, AND IMPROVEMENT PLANS**: "**To prevent direct mortality of bats that may roost in structures on the site, the following requirements shall be implemented during all stages of project development and construction:

A. Large Barn: Under direct supervision of a qualified bat biologist, and only during "seasonal periods of bat activity", conduct partial dismantling of portions of the exterior siding and roofing materials to increase light and airflow into structure, causing bats to abandon the structure of their own volition. All walls will require some removal of siding material to accomplish this, but the upper loft will also require supplemental lights aimed up from the floor directly beneath the hop cars to cause bats to abandon the roost crevices.

   "Seasonal periods of bat activity" are identified as:

   1. Between March 1 (or when heavy rains [greater than ½" in 24 hrs.] cease and/or evening temperatures remain above 45F) and April 15 (after which time females will begin to give birth to pups.

   2. Between September 1 (after all pups are self-sufficient) and approximately October 15 (or before heavy rains [greater than ½" in 24 hrs.] begin and/or evening temperatures fall below 45F)

B. South Hop Barn: Under direct supervision of a qualified bat biologist, and only during seasonal periods of bat activity, conduct partial dismantling of portions of exterior siding and roofing materials to increase light and airflow into structure, causing bats to abandon the structure of their own volition. All walls will require some removal of siding material to accomplish this. Refer to mitigation above to identify the seasonal periods of bat activity.

C. North Hop Barn: Under direct supervision of a qualified bat biologist, and only during seasonal periods of bat activity, conduct partial dismantling of portions of exterior siding and roofing material to increase light and airflow into the structure, causing bats to abandon the structure of their own volition. All walls will require some removal of siding material to accomplish this. Refer to mitigation above to identify the seasonal periods of bat activity.

D. Residence: Under direct supervision of a qualified bat biologist, and only during seasonal periods of bat activity, conduct partial dismantling of portions of exterior siding and roofing materials to increase light and airflow into the structure, causing the bats to abandon the structure of their own volition. All walls and portions of the soffit boards will require some removal of material to accomplish this. Refer to mitigation above to identify the seasonal periods of bat activity.

E. Chicken Shed: No further actions are required to prevent the use by bats or take of roosting bats.

F. Pump/Storage Barn: To reduce the likelihood of this building being used by bats abandoning the larger structures, all doors should be left open during the day and night hours. No further actions are required."

Mitigation Monitoring 4.a.3: PRMD staff shall ensure that the measures are listed on all grading, building and improvement plans, prior to issuance of grading or building permits. Failure by the applicant to comply with the above requirements may result in a revocation or modification of the Use Permit.

Mitigation Measure 4.a.4: To protect the potential presence of the western pond turtle and its habitat, the following terms are recommended:

To protect the potential habitat for the western pond turtle, the following terms are recommended:

a. Establish and maintain a minimum 50-foot wide setback around the reservoir prior to any ground disturbing activities or project construction. Any stockpiling of wine cave spoils on the project site shall also maintain a minimum of 50-foot wide setback around the reservoir. Except for the exclusions stated herein, no activities shall occur within the setback area. Excluded from the setback area required by this term are any features, and access to such features, that are currently in existence and are delineated on the proposed development map. Features are defined as including but not limited to: cropland and planted landscape areas, roads and roadways, bridges, equipment and material storage areas, buildings, structures, fences, wells, pipes, drainage facilities, utility lines and poles, pumps, sumps, and water diversion and storage facilities. Planting and irrigation of riparian vegetation within the setback area is allowed;
b. A qualified biologist shall conduct a pre-construction survey for western pond turtle, in those areas not already paved or graveled. If pond turtle is observed in the proposed construction area, the biologist shall notify CDFW and provide a relocation plan for the individual.
c. In the future, prior to dredging the reservoir, a plan should be created to avoid disturbing the emergent (wetland) vegetation around the reservoir during dredging operations. Approval of

any dredging operations should be obtained from the California Department of Fish and Wildlife; a. Establish and maintain a minimum 50-foot wide setback around the reservoir.

Mitigation Monitoring 4.a.4: Prior to issuance of any grading permit or any ground disturbing activities, the Permit Holder shall be responsible for establishing a 50-foot wide setback from the existing reservoir. Under the guidance of a qualified biologist, Wildlife Exclusion Fencing (WEF) shall be installed at the edge of the 50-foot setback line and shall remain in place throughout the duration of the project and while construction activities are ongoing. Upon project completion the WEF can be completely removed and the areas returned to original condition or better.

b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
				X

<u>**Comment**</u>:
4. b. No Impact: See discussion above in 4(a) and below in item 4(c). The project has been designed to avoid wetlands and riparian habitats and would not require wetland delineations or permits from the Corp of Engineers or the RWQCB. The project does not include the placement of fill into wetlands or water. No impacts are anticipated as a result of the project design in which such habitats are avoided.

Mitigation: None required

c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
				X

<u>**Comment:**</u>
4 c. No Impact There are two natural drainages on the east side of Westside Road. These drainages do not show up as blue line drainages on the USGS quadrangle and do not occur on the west side of the road or property. One of the drainages is located between the two existing hop kilns and is fed by the road side ditch that runs along the west side of West Side road. The other natural drainage is south of the hop kiln. A drainage ditch runs along the west side of the existing access road just east of the hop kilns and an agricultural ditch runs along the west side of the existing vineyard east of the hop kilns. The agricultural ditch is located east of the proposed overflow parking area, between the proposed parking area and the existing vineyard. The agricultural ditch supports wetland vegetation according to the Habitat Assessment. Wetland

vegetation in the agricultural ditch included meadow barley, water plantain, umbrella sedge and ryegrass.

All of the drainages and ditches within the project area and on the property potentially qualify as waters of the United States as defined by the U.S. Army Corps of Engineers (Corps) and all of these features definitely qualify as waters of the State as defined by the RWQCB. The natural drainages would also likely fall within the jurisdiction of the California Department of Fish and Wildlife (CDFW).

Formal delineation of wetlands and waters of the U.S. and state was not conducted as part of the habitat assessment. However, the assessment concludes that the project has been designed to avoid any impacts to the existing drainages in the project area, therefore a delineation is not required and no permits will be needed from the U.S. Army Corp of Engineers or the Regional Water Quality Control Board (RWQCB) for placement of fill into wetlands or water.

Mitigation: None required

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
			X	

Comment:

4.d. Less than Significant Impact:
Wildlife movement includes migration, inter-population movement and small travel pathways. While small travel pathways usually facilitate movement for daily home range activities such as foraging or escape from predators, they also provide connection between outlying populations and main the corridor, permitting an increase in gene flow among populations.

Wildlife connectivity of the project site to other open lands in the area can occur through the vineyards and undeveloped lands. There are no barriers to movement between the pond on site and ponds located further west. Westside Road is likely not a barrier to movement based on the rate of traffic after the wineries and tasting rooms have closed their doors. As a result, animals are likely able to move across the road at dusk and night without mortality from traffic.

As noted above, the proposed project involves existing and proposed uses and structures within already developed areas of an agricultural parcel as well as new structures that as designed and would not interfere with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. As designed, the project will not result in barriers being created for wildlife migration. Wildlife will still be able to move through the open areas and the vineyard and should not result in an impediment for wildlife to move through the property or to access the Russian River, and therefore would result in less than significant impact.

As noted above, Mitigation Measures under Item 1 require that all exterior lighting meet County standards for rural areas and does not allow flood lights that could impede wildlife corridors.

Mitigation: Refer to Mitigation Measures in Item 1 Aesthetics above in this initial study				
e) Conflict with any local policies or ordinances protecting biological resources, such as tree preservation policy or ordinance?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
		X		

<u>**Comment**</u>:

4.e. Less than Significant with Mitigation Incorporated: The project site is within the VOH (Valley Oak Habitat) combining zoning district and the project must be consistent with the requirements of the VOH district. In addition, Sonoma County has regulatory authority over large native trees, trees with historical importance, and oak woodland habitat, under the Sonoma County Native Tree Protection and Preservation Ordinance. Three vegetation community types occur within the project site: *Quercus agrifolia* woodland alliance or coast live oak: ruderal non-native grassland and landscaped areas. There are also existing vineyards adjacent to the project area but they are not part of the proposed development. There is also a grove of Northern California black walnut (Juglans hindsii) in the eastern part of the property near the Russian River. No development is proposed for the black walnut grove other than placement of some picnic tables which would not impact the trees or non-native grassland understory. A pond is located on the west side is within the property boundary but will not be impacted or developed. The pond does support some willow (Salix spp.), and other riparian vegetation.

The coast live oak woodland is located on the east side, adjacent to Westside Road, is a remnant stand of oak woodland, from what was probably the native vegetation prior to development of the area. The dominant tree species is coast live oak and includes some valley oak, black oak, California buckeye and California bay laurel. A common understory shrub species in this type is poison oak. Understory herbs includes miner's lettuce and California poppy. Coast live oak woodland occurs in small patches within and adjacent to the property. Other than individual oak trees to be removed within the ruderal non-native grassland type, the remnant oak woodland stands will not be impacted by the project. The ruderal grassland is comprised of a variety on non-native grasses and forbs with no one species being dominant. Within the ruderal grassland are several native tree species including coast live oak, valley oak and cottonwood. Landscapes areas include the landscaped yard around the existing residence and buildings. Plant species associated with this type include garden herbs such as sweet alyssum and garden iris, garden shrubs such as roses along with planted landscape trees such as red oak, Italian alder, honey locust, fig, apple, and various fruit trees as well as native coast redwood. A grove of Northern California black walnut is located outside of the project area adjacent to the Russian River on the east side of the property. However, only those trees which are considered truly endemic or native are given a special status. Although the grove of walnut trees may be significant it is likely that they are not truly endemic or native which means that they do not qualify as special status species. The only plans for this area are to place some picnic tables which would only be used seasonably, and as noted in the Biological Assessment prepared by Wildlife Research Associates, the placement of picnic tables within the grove would not have an adverse impact upon the grove.

The project development will result in the removal of a total of 21 trees as part of the project. This includes 16 native trees: 6 coast live oak trees, 5 valley oaks, 4 cottonwoods and one redwood. The Sonoma County Tree Protection Ordinance General Provisions state:

"Projects shall be designed to minimize the destruction of protected trees. With development permits, a site plan shall be submitted that depicts the location of all protected trees greater than 9 inches (9") and their protected perimeters in areas that will be impacted by the proposed development, such as the building envelopes, access roads, leachfields, etc."

Protected Trees are defined as:

"Protected tree" means Big Leaf Maple, Black Oak, Blue Oak, Coast Live Oak, Interior Live Oak, Madrone, Oracle oak, Oregon Oak, Redwood, Valley Oak, California Bay."

"Protected tree of special significance" means Quercus lobate Valley Oak.

The Tree Protection Ordinance also states:

"The valley oak shall receive special consideration in the design review process to the extent that mature specimens shall be retained to the fullest extent feasible. Valley oaks contribute greatly to Sonoma County's visual character, landscape and they provide important visual relief in urban settings. On existing parcels created without the benefit of an accompanying EIR, design review shall focus on the preservation of valley oaks to the fullest extent feasible. Where such preservation would render a lot unbuildable, partial protection with accompanying appropriate mitigations developed by a certified arborist shall be incorporated into the project design. In such cases where only partial protection can be achieved, full replacement in accordance with the arboreal value chart shall be required."

The project shall comply with the County's Tree Protection Ordinance. Compensation for loss of native trees is provided in the ordinance and is based on arboreal value. The ordinance requires one hundred percent (100%) replacement of trees or the payment of in-lieu fees. The VOH district under Section 26-67-030 of the Zoning Code states that when any person cuts down or removes any large valley oak, or any small valley oaks having a cumulative diameter at breast height greater than sixty inches (60″), on any property within the VOH district, such person shall mitigate the resulting valley oak loss by one of the following measures:

(1) retaining other valley oaks on the subject property,
(2) planting replacement valley oaks on the subject property or on another site in the county having the geographic, soil, and other conditions necessary to sustain a viable population of valley oaks,
(3) a combination of measures (1) and (2), or
(4) payment of an in-lieu fee, which shall be used exclusively for valley oak planting programs in the county. Such person shall have the sole discretion to determine which mitigation measure to use to mitigate the valley oak loss.

The requirements for each mitigation measure are specified in the Table under Section 26-67-030 of the Zoning Code. The selected mitigation measure shall be undertaken and completed within one (1) year after the valley oak or valley oaks are cut down or removed in accordance with guidelines established by resolution or ordinance of the Board of Supervisors.

A certified arborist shall provide a final tree survey and inventory. The project shall comply with all provisions of the County's Tree Protection Ordinance so as to avoid impacts and injury to the remaining trees on-site. A report prepared by a certified arborist shall be completed and submitted to PRMD prior to issuance of any grading or building permits, which shall provide for the replacement of those trees to be removed as well as the protection of remaining trees. A final landscape plan shall be based on the findings of the arborist report address the replacement of any native specimens.

Mitigation Measure 4.e 1: A total of 21 trees are proposed for removal as part of the project development, they include: 6 coast live oak trees, 5 valley oaks, 4 cottonwoods and one redwood, all of which are native trees. Prior to final design review before a joint meeting with the Design Review Committee/Sonoma County Landmarks Commission and prior to PRMD issuance of any grading or building permit, a certified arborist shall submit a final tree survey and inventory to the Project Planner. The arborist shall provide the replacement value of the trees to be removed and the protection measures during construction activities for the remaining trees. A final landscape plan shall be based on the findings of the arborist report address the replacement of any native specimens.

Mitigation Monitoring 4.e.1: Prior to final design review before a joint meeting with the Design Review Committee/Sonoma County Landmarks Commission and prior to issuance of any grading or building permits, the Project Planner shall review the arborist report and shall review the final design plans to ensure that the replacement trees are incorporated into the final landscape plan.

Mitigation Measure 4.e.2: The project site is subject to the VOH district requirements to mitigate for removal of any Valley Oak tree under Section 26-67-030 of the Zoning Code. Any removal of any large valley oak, or any small valley oaks having a cumulative diameter at breast height greater than sixty inches (60″), on any property within the VOH district, the Permit Holder shall mitigate the resulting valley oak loss by one of the following measures:

(1) retaining other valley oaks on the subject property,
(2) planting replacement valley oaks on the subject property or on another site in the county having the geographic, soil, and other conditions necessary to sustain a viable population of valley oaks,
(3) a combination of measures (1) and (2), or
(4) payment of an in-lieu fee, which shall be used exclusively for valley oak planting programs in the county.

The Permit Holder has the sole discretion under the VOH district criteria to determine which mitigation measure to use to mitigate the valley oak loss. The requirements for each mitigation measure are specified in the Table under Section 26-67-030 of the Zoning Code. Prior to occupancy of the winery or tasting room building whichever is first, the mitigation measure shall be implemented.

Mitigation Monitoring 4.e.2: Prior to issuance of any grading or building permits, or prior to final design review before a joint meeting with the Design Review Committee/Sonoma County Landmarks Commission, an appropriate form of mitigation set forth in the Table under Section 26-67-030 of the Zoning Code shall be incorporated into the project and the projects' final landscape plan. Prior to final occupancy on the winery or tasting room buildings whichever is first, the mitigation measure shall be implemented.

Mitigation Measure 4.e.3: NOTE ON GRADING PLANS: "In the areas of project development, construction fencing shall be installed under the drip-line of all trees that will be retained. Construction fencing shall be placed to ensure that no construction equipment, fill, staging or storage will impact the root zone of these oaks. An arborist shall inspect the location of the construction fencing to insure the root zones of the trees to remain are protected."

Mitigation Monitoring 4.e.3: PRMD shall ensure the note has been placed on all grading plans. Also prior to any grading activities the Permit Holder shall submit to the Project Planner evidence through photographs and an arborist letter that construction fencing has been installed prior to issuance of any related grading or building permits for the project.

Mitigation Measure 4.e. 4: Native trees to be removed greater than 6" DBH should be replaced by planting same species Plantings of native oaks on site at a ratio of 5 to 1 should be installed within the project landscape plan. It is recommended that new landscape plantings utilize as many native species as possible (shrubs and trees).

Mitigation Monitoring 4.e.4: PRMD shall require any planting of any replacement native oaks trees is done prior to issuance of final occupancy of the winery or tasting room buildings for the project.

f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state Habitat Conservation Plan?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
				X

Comment:
4.f. No Impact: There are no adopted Habitat Conservation Plans or Natural Community Conservation Plans applicable to the project site.

Mitigation: None required

5. CULTURAL RESOURCES - Would the project:

a) Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
		X		

Comment:
5.a. Less than Significant with Mitigation Incorporated: The proposed project includes a new winery and wine caves on the west side of Westside Road, and on the east side of Westside Road will involve the re-purposing/refurbishing of the existing hop kiln into a tasting room and the refurbishing of the hop baling barn into a private tasting room with marketing accommodations on the upper floor. The proposal also includes 22 agricultural promotional events with a range of guests (10 events and 30 guests, 5 events with 60 guests, 5 events with 120 guests, and 2 events with 300 guests) and participation in industry-wide events totaling two (2) day events with a maximum of 300 guests, totaling 24 annual events. There are no weddings proposed and the winery facility will not be rented out to third parties.

Historical Resource Study and Supplemental Historical Resource Study:

A Historic Resource Study (dated July 2014) and a Supplemental Historic Resource Study (dated March 2015) was prepared for the project by Knapp Architects. Since the project includes the conversion of an old hop kiln building into a public tasting room and a hop bale barn into a private tasting room with a two-guest room marketing accommodation unit on the upper floor, the project was referred to Sonoma County Landmarks Commission. The site is not identified in the current Historic Resources Inventory in use by PRMD, nor is it identified in the expanded list provided in the 2007 Sonoma County Landmarks Commission Five Year Work Plan and New Sonoma County Historic Era Resources Database.

The report evaluated the historical and architectural significance of two agricultural buildings, the Hop Kiln and Baling Barn, and the wood Trestle that connected them. The report finds that the property appears to be eligible for listing in the California Register, and therefore considered historical resources for the purposes of CEQA.

Sonoma County Landmarks Commission and Design Review Committee:

On November 4, 2014, the Landmarks Commission reviewed the project plans and the Historic Resource Study prepared by Knapp Architects, whereas, they accepted the Historic Resource Study, but recommended further review in a joint meeting with the Design Review Committee.

On December 2, 2014, a joint meeting before the Sonoma County Landmarks Commission and the Design Review Committee was held to review the project. The Design Review Committee (DRC) approved the existing height of the Hop Kiln and Bale Barn which exceeds 35 -feet. The DRC also approved maintaining these two structures in their current footprint within the Scenic Corridor setback. The two Committees' review resulted in the following actions:

- Final review of the project (after the Board of Zoning Adjustments decision) to be by the Joint LRC I ORC.
- The Joint LRC I DRC recommend that the HD (Historic Combining District) be added to the property.

The report further evaluated proposed alterations and concludes that the project would conform to the Secretary of the Interior's Standards for Rehabilitation in almost all respects and would not materially impair the characteristics which make it eligible for listing, meaning that under the CEQA Guidelines, the project would have a less than significant impact on historical resources.

On July 7, 2015, at the applicant request, the project returned to the Landmarks Commission requesting that HD zoning not be recommended for the west side of the road, as the buildings on this property have been found to be ineligible for listing on the California Register, and because the addition of the HD to the west side of the road would not add a measurable degree of historical protection for the hops complex on the east side of the road.

At the July 7, 2015, Landmarks Commission meeting, the Commission voted unanimously to recommend addition of the HD Combining Zone and Landmark Designation on APN 110-240-031 in its entirety (east side of Westside Road). They recommended not adding the HD combining zone on APN 110-240-040 (west side of Westside Road. Their decision was based on findings that the historic resources on the east side of Westside Road met the eligibility and integrity criteria for State and Local County designation and the HD Combining Zone. However, the structures on the west side of Westside Road had changed over time to the extent that they no longer retained historic integrity that met eligibility criteria. A mitigation measure will be incorporated into the project to ensure the historical protection is provided by placing the HD combining zoning district on the parcel.

Cultural Resource Evaluation:

A cultural resources evaluation of the property was conducted by William Roop, of Archaeological Resources Service, April 2014. A surface reconnaissance of the project areas located on both the west and eastern sides of the property was performed. The evaluation was focused on the presence of pre-historic era stone tools or discolored soil deposits. The areas of the proposed improvements were examined as well as the accessible faces of exposed boulders for the presence of cupule petroglyphs or bedrock mortar depressions, however, no signs of either were observed. The report further states that in spite of the presence of the historic-era farm house, barn and hop kiln structures with both sides of the parcel, no concentrations of historic era artefactual materials such as solarized glass, broken glass containers, pottery or earthen-ware ceramics and items that would normally be found in a historic farmstead similar to this. The cultural resources evaluation found no indication of the presence of a potentially significant historic or pre-historic era archaeological deposit with the evaluated area. The soils of the site are alluvial, indicating the possibility of buried cultural resources. This potential exists wherever Holocene alluvium or colluviums are present. Examination of rodent burrows and other exposures did not indicate the presence of subsurface deposits, and it is likely that none are present. No potentially significant cultural materials were observed on the site. Modern debris was observed, but none was considered to be culturally significant.

The cultural resources evaluation concluded that since no significant cultural resources were identified on the property, no further recommendations are warranted for pre-historic materials. However, if during earth disturbing activities on the property a concentration of artifacts is encountered, all work should be halted in the vicinity of the find and an archeologist contacted immediately. If human remains are encountered anywhere on the property, all work must stop in the immediate vicinity of the discovered remains and the County Coroner and a qualified archeologist must be notified immediately so that an evaluation can be performed. If the remains are deemed to be Native American and pre-historic, the Native American Heritage Commission must be contacted by the Coroner so that the “Most Likely Descendant” can be designated and the appropriate procedures followed. The project area consists of alluvial deposits that are less than 10,000 years old. These soils were deposited during the span of human occupation of the Santa Rosa Plain, and thus have a potential to contain archaeological deposits, artifacts, or features, that are not visible on the surface.

Conformance with AB 52

Permit Sonoma referred the project to those Native American tribes who requested such notices pursuant to Assembly Bill 52. A referral was also sent by the County to Tribal contacts to solicit input under AB 52 related to Tribal Cultural Resources. One local tribe responded, the Lytton Rancheria, requesting a mitigation measure be incorporated into the project. The language below under Mitigation Measure 5.a. 3 was found acceptable by the tribe. The following mitigation measures will be incorporated into the project reducing potential impacts to cultural, historical, and tribal cultural resources to a level of less than significant.

Mitigation Measure 5.a.1: Prior to temporary or final occupancy on either the hop kiln or hop bale barn, the applicant shall submit complete application and current processing fee for Level 1 zone change to add the HD Combining Zone and Landmarks designation on APN 110-240-031 (east side of Westside Road) prior to issuance of any grading or building permit on that parcel. (Adding the HD overlay zone may be processed as a part of the Comprehensive Planning Division’s semi-annual package of zone changes required as conditions of approval.)

Mitigation Monitoring 5.a.1: PRMD shall not allow temporary or final occupancy on either the hop kiln or hop bale barn, the applicant shall submit complete application and current processing fee for Level 1 zone change to add the HD Combining Zone and Landmarks designation on APN 110-240-031 (east side of Westside Road) prior to issuance of any grading or building permit on that parcel.

Mitigation Measure 5.a.2: NOTES ON GRADING, IMPROVEMENT, AND BUILDING PERMIT PLANS:

“The following cultural resource protection measures shall be included in the project:

1. All employees or others on the project site/job site shall be told that no artifacts are to be removed from the area except through authorized procedures. In this usage “artifacts” means any item over fifty (50) years of age. As a general rule artifacts greater than 100 years of age should be considered important unless a specific evaluation determines otherwise.

2. If archaeological or paleontological resources are found, all earthwork in the vicinity of the find shall cease, and PRMD staff shall be notified so that the find can be evaluated by a qualified archaeologist. When contacted, a member of PRMD Project Review staff and project archaeologist shall visit the site to determine the extent of the resource and to develop proper mitigation measures required for the discovery. No further grading in the vicinity of the find shall commence until a mitigation plan is approved and completed subject to the review and approval of the archaeologist and Project Review staff.

3. All employees or others on the job site shall be educated and informed that no artifacts are to be removed from the area except through authorized procedures. It should be made clear to all individuals and companies associated with any project that any artifacts found in the course of work are the property of the Agency. It is not up to the contractor to determine what the agency considers important.

4. Any artifacts that are found on or near the project area are to be turned over to, or brought to the attention of, the inspector, project manager, or the discoverer’s immediate supervisor.

5. Whenever any artifact is found or reported, a tag should be included that indicates the following: (A) the identity of the finder and the date of discovery; (B) the identity of the inspector or other responsible individual to whom the artifact is given; (C) a description of the location where the artifact was found, such as the approximate distance and direction to the nearest measured point, identification of a point on the building plans, or other reliable, accurate method; and (D) a description of the artifact that will allow it to be identified if the tag and artifact are separated.

6. The inspector shall carry a small supply of plastic baggies and 3x5 cards for documentation of artifacts.

7. The artifact, if portable, should be transported to a safe location where it can be kept until it can be inspected by an archaeologist. “

Mitigation Monitoring 5. a. 2: PRMD staff shall ensure that the notes listed above has been placed on all grading, building, and improvement plans prior to issuance of permits. The Permit Holder shall ensure the above protection measures are implemented during ground disturbing activities and project construction. If violations occur, PRMD shall seek voluntary compliance from the Permit Holder and thereafter may initiate an enforcement action and/or Use Permit revocation or modification proceedings, as appropriate. (Ongoing).

Mitigation Measure 5.a. 3: The Permit-Holder shall be responsible to ensure:

a. There shall be a qualified archaeological monitor and/or tribal monitor present during all initial ground- disturbing activities into native soils on the project. The tribal monitor shall be, but not limited to, a representative(s) of the Lytton Rancheria. The qualified archaeological monitor and/or tribal monitor shall have the authority to stop and redirect grading activities to evaluate any tribal cultural resources discovered on the property. Such evaluation shall be done in consultation with the appropriate tribe. However, if the archaeologist and tribal monitor determine, based on their knowledge and experience, that there is no further need for monitoring, the monitoring may cease.

b. All building and/or grading permits shall have the following note printed on plan sheets:

“In the event that archaeological resources such as pottery, arrowheads, midden or culturally modified soil deposits are discovered at any time during grading, scraping or excavation within the property, all work shall be halted in the vicinity of the find and County PRMD project Review staff shall be notified and a qualified archaeologist shall be contacted immediately to make an evaluation of the find and report to PRMD. PRMD staff may consult and/or notify the appropriate tribal representative from tribes known to PRMD to have interests in the area. Artifacts associated with prehistoric sites include humanly modified stone, shell, bone or other cultural materials such as charcoal, ash and burned rock indicative of food procurement or processing activities. Prehistoric domestic resources include hearths, firepits, or house floor depressions whereas typical mortuary resources are represented by human skeletal remains. Historic artifacts potentially include all byproducts of human land use greater than 50 years of age including trash pits older than 50 years of age. When contacted, a member of PRMD project Review staff and the archaeologist shall visit the site to determine the extent of the resources and to develop and coordinate proper protection/mitigation measures required for the discovery. PRMD may refer the mitigation/protection plan to designated tribal representatives for review and comment. No work shall commence until a protection/mitigation plan is reviewed and approved by PRMD project Review staff. Mitigations may include avoidance, removal, preservation and/or recordation in accordance with California law. Archeological evaluation and mitigation shall be at the applicant’s sole expense.

If human remains are encountered, all work must stop in the immediate vicinity of the discovered remains and PRMD staff, County Coroner and a qualified archaeologist must be notified immediately so that an evaluation can be performed. If the remains are deemed to be Native American, the Native American Heritage Commission must be contacted by the Coroner so that a “Most Likely Descendant” can be designated and the appropriate provisions of the California Government Code and California Public Resources Code will be followed.”

Mitigation Monitoring 5.a. 3: Prior to any ground disturbing or grading activities, the Permit Holder shall be responsible for ensuring a qualified archaeological monitoring and/or tribal monitor is present during all initial ground-disturbing activities into native soils on the project. The PRMD shall not issue any grading or building permit until staff has determined the above note has been placed on the plans. In the event that archaeological resources, tribal cultural resources, or cultural resources are discovered, such as pottery, arrowheads, midden, or culturally modified soil deposits are discovered at any time during grading, scraping or excavation within the property, all work shall be halted in the vicinity of the find and County PRMD project Review staff shall be notified and a qualified archaeologist shall be contacted immediately to make an evaluation of the find and report to PRMD. Failure by the Permit-Holder to comply with these requirements shall be considered a violation of the Use Permit and may result in the modification or revocation proceedings of the said Use Permit.

b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
		X		

Comment:
5. b. Less than Significant with Mitigation Incorporated: (Refer to discussion and mitigation measures listed in item 5.a. above in this initial study checklist). As noted in item 5(a) above, the project will involve the refurbishing and rebuilding of existing structures on the west side of property as well as the construction of a new winery building and associated wine cave, along with the removal of an existing residence on both the west and east side of the property. As discussed above, a Cultural Resources evaluation has been conducted for the project site, which concluded that no significant cultural resources were identified on the property, but did provide for recommendations should resources be unearthed during construction. Mitigation measures have been included that when implemented will reduce the impact to less than significant.

Mitigation: Refer to mitigations under item 5.a. above.

Mitigation Monitoring: Refer to monitoring under item 5.a. above.

c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
		X		

Comment:
5.c. Less than Significant with Mitigation Incorporated. (Refer to discussion and mitigation measures listed in item 5.a. above in this initial study checklist). The proposed project will not destroy unique geologic features. However, the project could potentially uncover previously undiscovered paleontological resources during project construction. The following mitigation measure will reduce the impact to less than significant.

Mitigation Measure: Refer to mitigations under item 5.a. above.

Mitigation Monitoring: Refer to monitoring under item 5.a. above.

d) Disturb any human remains, including those interred outside of formal cemeteries?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact

			X	

Comment:
5.d. Less than Significant Impact: In the event that human remains are unearthed during construction, state law requires that the County Coroner be contacted in accordance with Section 7050.5 of the State Health and Safety Code to investigate the nature and circumstances of the discovery. If the remains were determined to be native American interment, the Coroner will follow the procedure outlined in CEQA Guidelines Section 15065.5(e).

6. GEOLOGY AND SOILS - Would the project:

a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving: i. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
				X

Comment:
6.a. No Impact: The project site is not mapped by the California Geological Survey (CGS) under the Alquist-Priolo Act, to be underlain by a “Holocene-active” earthquake fault capable of resulting in surface fault rupture. A Geotechnical Study Report prepared by RGH Consultants, dated January 27, 2014, states the geologists did not observe landforms within the area that would indicate the presence of active faults. The table included in the Geotechnical Study (page 6) lists the closest fault to be the Healdsburg-Rodgers Creek fault approximately 5 ¼ miles to the north-east of the project site. Although new structures are proposed and significant rehabilitation of existing structures will occur it is anticipated that any impacts would be less than significant as earthquake design is taken into account for the occupancy of a structure, including site class, soil classifications and various seismic coefficients, which are used to determine a seismic design category for a project.

Mitigation: None required

ii. Strong seismic ground shaking?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
			X	

Comment:
6.a.ii Less than Significant Impact: All of Sonoma County is subject to seismic shaking that would result from earthquakes along the San Andreas, Healdsburg-Rodgers Creek, and other faults. Predicting seismic events is not possible, nor is providing mitigation that can entirely reduce the potential for injury and damage that can occur during a seismic event. However using accepted geotechnical evaluation techniques and appropriate engineering practices, potential

injury and damage that can be diminished, thereby exposing fewer people and less property to the effects of a major damaging earthquake. The design and construction of the tasting facilities, winery and wine cave are subject to load and strength standards of the California Building Code (CBC), which take seismic shaking into account. Project conditions of approval require that building permits be obtained for all construction and that the project meet all standard seismic and soil test/compaction requirements. The project would therefore not expose people to substantial risk or injury from seismic shaking, therefore reducing the impact to less than significant.

Mitigation: None required

iii. Seismic-related ground failure, including liquefaction?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
			X	

Comment:
6.a.iii Less than Significant Impact. The project site is located within an area subject to liquefaction hazards as shown on the Sonoma County Relative Hazard from Seismic Shaking map. Strong ground shaking during an earthquake can result in ground failure and/or settlement such as that associated with soil liquefaction, and can also cause deformation of slopes, particularly fill slopes. Therefore the property has the potential to experience liquefaction and settlement during a seismic event. However, all structures will be required to meet building permit requirements, including seismic safety standards and soil test/compaction requirements. Based on standard permitting requirements, the project will have no significant risk of loss, injury or death from seismic ground failure or liquefaction. Also see discussion above in item 6.a.ii above.

Mitigation: None required

iv. Landslides?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
				X

Comment:
6.a.iv No Impact The project site is not located in a landslide prone area as shown on Geology for Planning in Sonoma County Special Report 120 Slope Stability, or the General Plan Safety Element Hazard Maps. This was confirmed in the Geotechnical Study Report prepared by RGH Consultants, dated January 27, 2014. The Geotechnical Study explains that a recent geologic map (Delattre 2011) which is used to depict large-scale landslides, does not indicate active landslides at the project site. The geologists of RGH Consultants also state they did not observe activate landslides at the project site. Therefore, the threat of landslide occurrence is low and no impacts would occur.

Mitigation: None required

b) Result in substantial soil erosion or	Potentially	Less than	Less than	No

the loss of topsoil?	Significant Impact	Significant with Mitigation Incorporation	Significant Impact	impact
			X	

Comment:
6.b. Less than Significant Impact: The project includes grading, cuts and fills which require the issuance of a grading permit under the authority of the County of Sonoma Permit and Resource Management Department. Construction activities will include on-site grading for the winery building and related facilities and surrounding landscaping, and excavation and construction of the wine cave using the cut-and-cover method (excavating that portion of the site, constructing the wine cave structure, and then covering the cave structure). No excavated materials will be removed from the site. As the excavation for the cut-and-cover operation is completed, and as the winery building site is graded, it is expected that excavated soil will be placed in two temporary stockpiles totaling about 7224 and 8619 cubic yards, and approximately 20 feet tall. The temporary stockpiles will be located outside of the required buffers for the scenic corridor and for the pond. The excavated soils will then be moved to their final locations (which may include landscaping on the site of the temporary stockpiles) and used to fill in and cover around the constructed cave structure, as fill under the winery, and for landscaping.

Unregulated grading during construction has the potential to increase soil erosion from a site which could have adverse downstream flooding impacts and further erosion impacts, and which could adversely impact downstream water quality. See discussion and mitigation measures under Hydrology and Water Quality, Items 9(c) of this checklist.

Mitigation: None required

c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
			X	

Comment:
6.c. Less than Significant Impact: The risk of impact to the project from the effects of lateral spreading, subsidence, liquefaction or collapse is considered to be less than significant with implementation of the conditions of approval requiring that all structures and grading be subject to grading and building permits as discussed above in item 6(a).

On January 17, 2014, a Tunnel Data and Feasibility Report for the project site's proposed wine cave was prepared by Condor Earth Technologies and provided to PRMD on October 1, 2018 (see Attachments to this initial study checklist). The 2014 Condor report provides subsurface data and preliminary geotechnical engineering conclusions and recommendations for the design and construction of the wine caves (tunnels) for the Ramey Winery.

A Condor staff geologist visually logged the earth materials encountered during drilling and directed the sampling of soil and rock. Five test pits were excavated on November 5, 2013 to depths of about 3 to feet. Figure 2 of the Condor report shows the approximate borings and test pit locations. Borings and test pit logs with the descriptions and classifications of rock properties

are attached in Appendix A. Appendix B contains the photographs of the core.
The Condor report explains they investigated subsurface conditions on the project site on by drilling four borings to depths of 20, 33, 43, and 20 feet, referred to a B-1, B-2, B-3, and B-4 respectively. A track mounted CME-55 drill rig and both auger and core drilling techniques were used.

According to the Condor report, the subsurface data indicates the ground surface at the project site is underlain by the following from top to bottom:

- Natural soil to depths of about 7 feet
- Up to about 7 feet of old alluvium
- Up to about 7 feet of completely weathered shale
- Serpentine extending to the maximum depth drilled of about 43 feet

Condor's initial sampling indicates that serpentine soils are present and may be within the area to be excavated for the caves. If found during wine cave excavation, it will be subject to strict controls in compliance with State Air Resources Board regulations, discussed under Air Quality, Section 3, above in this initial study.

Condor's report concludes, based on their review of the subsurface data and engineering evaluation, that the construction of the proposed wine cave at the project site is feasible, but that for much of the site, caves constructed using cut and cover methods are more suitable than tunnels. The applicant intends to use the cut and cover method for the entirety of the cave excavation.

Condor further explains in a letter dated November 2, 2018, that the proposed wine cave construction will require engineering, including, but not limited to civil, grading, geotechnical, structural, mechanical, and electrical, and will be designed by a California- licensed engineers and the construction will be done by California-licensed contractors. Licensing requirements for "tunneling" will not apply to this project based on the proposed wine cave construction-type.

Site Seismicity

The site is located in a seismically active area of California in an area of regional faulting. In the Condor report, Figure 5, Regional Fault Map shows the nearest active fault (Rodgers Creek Fault) is approximately 5.5 miles from the project site. The project site is also approximately 3.5 miles away from a potentially active fault, special study zone according to the Healdsburg Quadrangle map from the website of the State of California Department of Conservation. Condor concludes the risk of surface rupture from faulting is considered low because the project site is not located near any active faults. With the requirement for engineered grading and building permit plans to construct the winery building and wine cave to meet the California Building Code standards and Fire Code standards, the potential impacts of the project resulting in unstable soils is less than significant.

Mitigation: None required

d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
			X	

Comment:
6.d. Less than Significant Impact: See discussion above under Item 6(a) iii and 6(c), which will require the issuance of building permits and a review of seismic and soil test/compaction requirements.

Mitigation: None required

	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?			X	

Comment:
6.e. Less than Significant Impact: The project site is not in an area served by public sewer. There is no evidence that the soils are incapable of supporting the disposal of waste water. The North Coast Regional Water Quality Control Board (NCRWQCB) must review and approve the required waste water system report. The domestic wastewater will be disposed of via on-site septic systems. The winery wastewater will be pre-screened at collection points in the facility and directed to an aerobic treatment unit (manufacturer to be determined). The treatment unit will reduce waste strength and suspended solids to levels approved by the State Water Quality Control Board for surface irrigation. The treated wastewater will be directed to storage until discharged to irrigation. Treated wastewater will be pumped to a point of connection to the vineyard irrigation system. The process system will be subject to a Waste Discharge Permit issued by the State Water Quality Control Board, North Coast Region. Prior to building permit issuance and vesting the Use Permit, the applicant shall obtain a permit for the sewage disposal system. The system may require design by a Registered Civil Engineer or Registered Environmental Health Specialist and both soils analysis, percolation and wet weather testing may be required. Wet weather groundwater testing may also be required. The sewage system shall meet peak flow discharge of the wastewater from all sources granted in the Use Permit and any additional sources from the parcel plumbed to the disposal system, and shall include the required reserve area.

This project is approved for agricultural promotional events and shall provide septic system capacity in accordance with PRMD Policy 9-2-31 (available on PRMD’s website under Policy and Procedures). The project septic system shall be designed to accommodate 100 % percent of the wastewater flow from an event with 60 guests, in addition to peak wastewater flows from all other sources plumbed to the septic system, including the 15 employees listed in the traffic study. Additionally, prior to issuance to building permits, the applicant will be required to obtain a permit for the sewage disposal system. The system may require to be designed by Registered Civil Engineer or Registered Environmental Health Specialist and both soil analysis, percolation and wet weather testing may be required. Application for wastewater discharge requirements shall be filed by the applicant with the North Coast Regional Water Quality Control Board. Documentation of acceptance of a complete application with no initial objections or concerns by the Regional Water Quality Control Board shall be submitted to the Project Review Health Specialist prior to building, grading for ponds or septic permit issuance (if the Regional Water Board Water Resource Engineer or Environmental Specialist have objections or concerns then the applicant shall obtain Waste Discharge Requirements prior to building permit issuance).

A copy of the Waste Discharge Permit shall be submitted to the Project Review Health Specialist prior to issuance of a Certificate of Occupancy or project operation and vesting the Use Permit. Prior to issuance of any related Building permits, the on- site septic systems and winery wastewater systems shall be approved under a permit with the Well and Septic Section of PRMD and These reviews as a condition of building permit issuance shall serve to address potential impacts associated with the on-site soils and sewage disposal to less than significant.

Mitigation: None required

7. GREENHOUSE GAS EMISSIONS - Would the project:

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
			X	

Comment:

7.a. Less than Significant Impact: The proposed project includes the production of 60,000 cases of wine within a two-story winery building, 32,210 square feet in size. The project would include a tasting room, retail sales, and an area designated for trade related industry events. The project application includes provisions for a total of 24 agricultural industry events per year. These include 10 events with 30 people in attendance, five 60-person catered events, participation in five 120-person industry wide events, and four 300-person outdoor events.

The primary source of GHG emissions associated with the project would be from traffic generated by the proposed project. Other sources would include direct emissions from natural gas usage and indirect emissions from electricity usage. Winemaking, occurring on-site, generates emissions of CO2 through the fermentation process that are considered biogenic emissions.

The proposed project is located in northern Sonoma County, which is in the Coast Air Basin. The Northern Sonoma County Air Pollution Control District has not established a climate protection program. The Northern Sonoma County Air Pollution Control District has jurisdiction over air quality in this area but uses the Bay Area Air Quality Management District (BAAQMD) CEQA Guidelines to evaluate GHG emissions.

On October 28, 2013, a GHG Emissions Analysis and a Revised GHG Analysis was prepared for the project by Illingworth & Rodkin, Inc. The California Emissions Estimator Model, Version 2013.2.2 (CalEEMod) was used to predict operational period emissions. Unless otherwise noted below, the model defaults for Sonoma County were used. The Year 2015 was used for modeling, as this assumed to be the first full year after construction that the project could be operational. However, the project was not deemed by PRMD to be complete for processing until 2017 and annual emissions occurring after 2015 would be lower as vehicle and electricity production emission rates are anticipated to continually decrease. Relative to traffic, the CalEEMod model uses mobile emission factors from the California Air Resources Board’s EMFAC2011 model. Forecasted project trip generation estimates provided by the traffic consultants, W-Trans, were applied. The default trip lengths and traffic mix for Sonoma County in CalEEMod were also used. Mobile emissions from planned county-wide industry events were calculated in a separate model run and were based on a reasonable worst-case scenario involving twenty-four 300-person events annually. Each event was calculated to generate 2,006 pounds of CO2e per day, or 48,114 pounds (22 metric tons) annually.

Relative to electricity, natural gas, water usage and solid waste production, default rates for energy consumption were assumed in the model. Emissions rates associated with electricity consumption were adjusted to account for Pacific Gas & electric utility's (PG&E) projected 2015 CO2 intensity rate. This 2015 rate is based, in part, on the requirement of renewable energy portfolio standard of 33 percent by the year 2020. CalEEMod uses a default rate of 641.35 pounds of CO2 per megawatt of electricity produced. The derived 2015 rate for PG&E was estimated at 391.16 pounds of CO2 per megawatt of electricity delivered and is based on the California Public Utilities Commission (CPUC) GHG Calculator.

The GHG analysis explains that relative to wine fermentation, the CalEEMod model does not account for CO2 emissions from wine fermentation. CO2 is released during the fermentation process. The International Wine Carbon Calculator (IWCC version 1.3) is an Excel spreadsheet that provides GHG emission estimates from various winery operations. This program was utilized to generally estimate CO2 emissions from fermentation, since specific details of the wine making were not known.

Assuming about 1,110 tons of grapes would be used to produce 60,000 cases of wine, CO2 emissions would be about 125 metric tons per year. These emissions are offset by the carbon sequestration resulting from the growing of the grapes; however, the offset was not computed for this evaluation.

Annual Operational GHG Emissions in Metric Tons of CO2e

Source	**Methodology**	**Emissions**
Mobile	Includes daily traffic generation including truck traffic	181
Mobile	24 Annual Events	22
Area	Includes landscaping from CalEEMod default	<1
Electricity	Based on CalEEMod default adjusted to PG&E emission rates published by CPUC	56
Natural Gas	Based on CalEEMod default	52
Water	Based on CalEEMod default	18
Solid waste	Based on CalEEMod default	20
Wine fermentation	Based on IWCC v1.3 estimate for 60,000 cases	125
Total		**475**

As shown in the table above, the proposed project would have total direct and indirect emissions that are below the GHG operational threshold (1,100 metric tons of CO2e per year) recommended by BAAQMD for new projects. Therefore, the project's GHG emissions would not significantly contribute to a cumulative impact on global climate change.

Global temperatures are affected by naturally occurring and anthropogenic-generated (generated by humankind) atmospheric gases, such as water vapor, carbon dioxide, methane, and nitrous oxide. Gases that trap heat in the atmosphere are called greenhouse gases (GHG). Solar radiation enters the earth's atmosphere from space, and a portion of the radiation is absorbed at the surface. The earth emits this radiation back toward space as infrared radiation. Greenhouse gases, which are mostly transparent to incoming solar radiation, are effective in absorbing infrared radiation and redirecting some of this back to the earth's surface. As a result, this radiation that otherwise would have escaped back into space is now retained, resulting in a warming of the atmosphere. This is known as the greenhouse effect. The greenhouse effect helps maintain a habitable climate. Emissions of GHGs from human activities, such as electricity production, motor vehicle use and agriculture, are elevating the concentration of GHGs in the atmosphere, and are reported to have led to a trend of natural warming of the earth's natural climate, known as global warming or global climate change. The term "global climate change" is often used interchangeably with the term “global warming,” but “global climate change” is preferred because it implies that there are other consequences to the global climate change include the following gases:

- Carbon dioxide (CO2);
- Nitrous oxide (N2O);
- Methane (CH4);
- Chlorofluorocarbons (CFCs);
- Hydrofluorocarbons (HFCs);
- Perfluorocarbons (PFCs)

State of California is addressing the issue of GHG through legislation, policy guidance, and outreach programs. California Governor Arnold Schwarzenegger announced on June 1, 2005, through Executive Order S-3-05, the following GHG emission reduction targets for California: by 2010, reduce GHG emissions to 2000 levels; by 2020, reduce GHG emissions to 1990 levels; by 2050, reduce GHG emissions to 80 percent below 1990 levels. The California Climate Action Team’s (CAT) Report to the Governor contains recommendations and strategies to help ensure the targets in Executive Order S-3-05 are met.

The project is also subject to the County’s building ordinance and energy efficiency ordinance, which requires new construction, including the project, to comply with the California Green Building Standards (CalGreen). In addition, the County implements General Plan Open Space and Resource Conservation Element Objective OSRC-14.4, which states “reduce GHG emissions by 25 percent below 1990 levels by 2015.”

The County is currently in the process of adopting a Climate Action Plan in conjunction with the other local agencies in Sonoma County that will meet the tiering and streamlining requirements of CEQA Guideline 15183.5.

The project would have a less than significant impact on GHG emissions because the project would generate an insignificant amount of GHG emissions as shown in the table and discussion above. Nonetheless, the proposed winery building must continue with being built in compliance with the California Green Building (CALGreen) Standards Code and include voluntary requirements which include exceeding Title 24 energy efficiency requirements. These include, but not limited to,

- Designated parking for fuel efficient vehicles (min. of 10 % of parking)
- Cool roofs that meet thermal emittance and solar reflectance standards
- A 30 percent reduction in indoor potable water use
- Outdoor potable water use not to exceed 60 percent of acceptable rates
- Recycled content of 10 percent of materials used
- Construction waste reduction of 65 percent, and
- Thermal insulation that meets low emitting materials standards.

The project development must meet the CALGreen Tier 1 standards using technologies that include, but not limited to, passive solar design, natural lighting and ventilation, hydrozone irrigation techniques, low flush toilets, disc grape pomace back into the on-site vineyard, and permeable hardscapes. All things considered, the proposed project is well below the thresholds established statewide and considered a less than significant impact.

Mitigation: None required

b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
			X	

Comment:
7.b. Less than Significant Impact: (Refer to discussion in item 7.a. above in this initial study checklist). The project does not propose any type of use or structure that would conflict with the County's adopted CalGreen building requirements. As shown in the table above in item 7a, the proposed project would have total direct and indirect emissions that are below the GHG operational threshold (1,100 metric tons of CO2e per year) recommended by BAAQMD for new projects. Therefore, the project's GHG emissions would not significantly contribute to a cumulative impact on global climate change. The County's Cal-Green requirements will help to ensure the project will implement GHG reduction measures reducing potential impacts to a level of less than significant.

Mitigation: None required

8. HAZARDS AND HAZARDOUS MATERIALS - Would the project:

a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
			X	

Comment:
8.a. Less than Significant Impact: The project consists of a winery with tasting rooms and event activities and is not a land use that produces or generates hazardous materials. The processing and fermentation of the grapes into wine includes the use and maintenance of machinery and equipment that require the transport, use, and disposal of hazardous materials (e.g., oils, diesel, solvents, lubricants, etc.). The vineyard operation requires the use and storage of pesticides and herbicides on the project site. The Sonoma County Agricultural Commissioner's Office regulates the storage and use of herbicides and pesticides by requiring the annual issuance of a Pesticide I.D. and classes be taken by persons applying such hazardous materials for agricultural uses such as vineyard operations. The County Fire and Emergency Services Department regulates storage and use of flammable materials associated with wineries. The County Environmental Health Specialist requires that the project applicant submit copies of updated permits. These regulatory agencies apply conditions to building permits that ensure the storage and use of any hazardous waste associated with the winery would not create a hazard.

Prior to initiation of the use permit, the winery and tasting rooms must comply with Code requirements already in place that will ensure the storage and use of any hazardous materials associated with the winery would not create a hazard to the public or the environment. Further, the County Fire Department requires the establishment of a Hazardous Materials Business Plan that specifies the use of use, storage, quantities, transportation, disposal and upset conditions for hazardous materials in accordance with County and state regulations. Therefore, with the standard permitting requirements under the local Building and Fire Codes, and the Hazardous Materials Business Plan required for the winery operations, the project would have a less than significant level of with regard to the use or storage of hazardous materials.

Mitigation: None required

b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
			X	

Comment:
8.b. Less than Significant Impact. (Refer to discussion in item 8.a. above in this initial study checklist). The project would not generate or produce hazardous materials. Hazardous materials (diesel fuels, solvents, oils, etc.) are contained in products used on site for use and maintenance of equipment and machinery. The vineyard operation is not part of this review, but use of pesticides and herbicides are regulated by the Sonoma County Agricultural Commissioner's Office. The project would have a less-than-significant impact involving release of hazardous materials into the environment.

Mitigation: None required

c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
			X	

Comment:
8.c. Less than Significant Impact. (Refer to discussion in items 8.a. and 8.b. above in this initial study checklist). The project is not located within one-quarter mile of a school, nor would the proposed winery include emission of hazardous materials or substances. See item 7.a, above, regarding regulation of hazardous materials at the planned winery.

Mitigation: None required

d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
				X

<u>Comment</u>:
8.d. Less than Significant Impact. The project site was not identified on, or in the vicinity of, any parcels on lists compiled by the California Environmental Protection Agency, Regional Water Quality Control Board, California Department of Toxic Substances Control, and the California Integrated Waste management Board, and no impacts would occur.

Mitigation: None required

For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
			X	

<u>Comment</u>:
8.e. Less than Significant Impact: The site is not within an airport land use plan as designated by Sonoma County. The project site (proposed 60,0000 case production winery, wine caves, tasting room, 24 agricultural industry events) is located 2.25 miles immediately northwest of the Sonoma County Airport/Charles Shultz Airport, runway number 2. The proposed project has been reviewed with respect to airport compatibility criteria in the County's March 14, 2016 Revised Comprehensive Airport Land Use Plan as well as the proposed amended criteria. Based on the initial review, the proposal was found consistent with the CALUP criteria. The subject property is outside of the Approach Protection Plan Area as depicted in Figure AT-10 of the General Plan. No safety hazard to people residing or working within two miles as the nearest airport is 2.25 miles to the southeast and therefore no impacts are anticipated as a result of the proposed project.

Mitigation: None required

f) For a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
				X

<u>Comment</u>:
8.f. No Impact: There are no known private airstrips within the vicinity of the proposed project. However, the project is located 2.25 mile northwest of the Sonoma County/Charles Shultz Airport. As discussed above under Item 8e, the proposed project has been reviewed with respect to airport compatibility criteria in the County's 2016 Revised Comprehensive Airport Land Use Plan as well as the proposed amended criteria. Therefore, the project would have no impact.

Mitigation: None required

g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact

			X	

Comment:
8.g Less than Significant Impact: The project would not impair implementation of, or physically interfere with the County's adopted emergency operations plan. There is no separate emergency evacuation plan for the County. In any case, the project would not change existing circulation patterns significantly, and would have no effect outside the area. In addition, the project was reviewed by the Office of Fire and Emergency Services who placed one of several conditions on the project as follows:

The Applicant shall provide a written "Fire Safety and Evacuation Plan" (as required by Section 403 and 404 of the California Fire Code) to Sonoma County Fire for approval. This includes but not limited to medial trained staff, fire watch, crowd managers. This plan shall be re-evaluated at any time when requested in writing by the fire code official.

a. This shall be also provided for the special events larger than 100 persons.

Mitigation: None required

h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas, or where residences are intermixed with wildlands?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
			X	

Comment:
8.h Less than Significant Impact: The project proposal statement includes water storage on-site as part of a project fire protection system. The project was reviewed by Fire officials and conditions for the project was provided to the Project Planner. Additionally, the County Fire Marshal's Fire Safe Standards require that new structures be installed with fire sprinklers with the intent to contain or prevent fires from spreading from structures to wildlands fires. Fire service features for buildings, structures and premises are required to comply with the Sonoma County Fire Safe Standards and the California Fire Code as adopted and amended by Sonoma County Code; including but not limited to: emergency access; road naming and address numbers; emergency water supply; and defensible space. Compliance with this Fire Safe Standards will ensure that the exposure of people and property to fire hazards would be reduced to a degree that the risk of injury or damage is less than significant.

Mitigation: None required

9. HYDROLOGY AND WATER QUALITY - Would the project:

a) Violate any water quality standards or waste discharge requirements?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact

			X	

Comment:

9.a Less Than Significant Impact: The proposed project is located on Westside Road, west of Highway 101 southwest of Healdsburg. Summary of the project proposal is construction of a new winery building, wine caves, two new driveway entrances, tasting room improvements to existing buildings, addition of parking areas, new on-site industrial wastewater disposal system and new on-site domestic septic systems. The project site is in a rural area not served by public sewer or water. The existing project site contains slopes ranging from 5-15 percent. There are several existing buildings, an existing pond, existing gravel driveways, and existing septic systems serving the residential uses. The existing septic systems (septic tank and leachfields) will be abandoned under permit with PRMD.

A Preliminary Storm Water Mitigation Plan (Plan), December 20, 2013 was prepared by Adobe Associates, Inc. for the proposed project. The report identified sources and pollutants of concern which include landscape and planting areas which could result in sediment, nutrients, pesticides, pathogens, trash and debris. Parking lots and driveways could result sediments, metals, total petroleum hydrocarbons and trash. The report addresses Source Controls and states that runoff from on-site driveway, parking lot and roofs will be directed to the on-site vegetated buffer areas to allow for treatment. These BMPs have been designed to meet Sonoma County Low Impact Development (LID) Manual requirements.

The Plan explains that as designed, drainage from winery parking area will be directed toward a drop inlet in the center island area that will outfall upslope of the existing pond. Runoff in the area of the turnout and driveway entrance will be directed toward an existing roadside swale along Westside Road. Runoff in the area of the tasting room improvements will be allowed to sheet flow through existing vegetation toward the eastern property line which borders the Russian River. All of the project development will be over 800-feet from the Russian River. According to the Plan, there will be a slight increase in runoff for the 2-year 24-hour storm as a result of the proposed improvements. The increase in the runoff in the area of the winery improvements will be captured in the existing pond. The existing pond will have adequate capacity to capture increase. Water treatment will be achieved by allowing the runoff to flow through vegetated buffer areas prior to entering the pond. There will be a slight increase in runoff east of the tasting room improvements that will be able to infiltrate into the existing vegetation prior to exiting the property. The BMPs to be incorporated into the proposed project, including the vegetated buffer areas will provide the necessary treatment to meet the County’s LID requirements.

The report concluded that runoff from the impervious roof and hardscape areas will be directed towards the proposed vegetated buffer areas. There will be no retention required as there is no increase from pre-construction to post-construction conditions.

To address storm water and related runoff concerns associated with the proposal, the Preliminary Storm Water Mitigation Plan provides for BMP Maintenance and Monitoring to be performed by the property owner. The property owner must prepare a maintenance plan, the implementation of which will keep the proposed source and treatment controls operating as originally designed and approved. At minimum, the maintenance plan shall include: the scope and frequency for inspection and scheduled maintenance, provisions for unscheduled maintenance, estimated design life including replacement. Each year the entity responsible for maintenance is required to complete an annual report that includes copies of completed inspection and maintenance activities that were conducted during the previous year. The annual report shall be retained for a period of at least five years and made available upon request to the County of Sonoma. Conditions of approval require that the County, the Regional Water Board, and Marin/Sonoma Mosquito &

Vector Control District be given permission to access the property as needed for inspection and remediation. If remediation of problems is required because maintenance is inadequate, County staff may enter the property and take necessary steps to restore the BMPs to good working order. The property owner shall be responsible for reimbursing the County for expenditures associated with restoring the BMPs to good working order.

The BMPs to be incorporated into the proposed project, including the vegetated buffer areas will provide the necessary treatment to meet the County's LID requirements, which as designed would reduce the potential impacts on water quality to a level of less than significant.

The industrial wastewater from the proposed winery's (ag processing) will be collected, aerated and stored in a series of treatment tanks to be disposed of via an irrigation system to serve the on-site vineyard. Domestic sewage disposal from the tasting rooms, marketing accommodations, guest and employee restrooms will be disposed of via on-site septic systems adjacent to the tasting rooms buildings on the east side and near the existing farmhouse on the west side. Both the winery wastewater system and the domestic systems will be designed by Adobe& Associates, a local engineering firm. The existing property consists of flat gentle sloping terrain with slopes ranging between 5-15 percent. The soil classification of the project site is "Yolo Loam" which is commonly found in the Russian River and Dry Creek Valleys and described as sandy loam, gravelly loam, silt loam, and clay loam surface layers in some areas. Based on the existing residential development on the project site and in the vicinity, Yolo Loam is suitable for domestic and industrial wastewater disposal systems. The Russian River forms the eastern boundary to the property. Both the winery wastewater system and domestic septic systems will be over 800 feet from the Russian River. There are several existing buildings on site, an existing pond, existing gravel driveways, and other improvements on site. The existing septic system is to be abandoned under a separate permit. A new septic system under a separate permit is proposed to accommodate the proposed development. Structures located within the proposed leach field are to be removed/demolished.

The Division of Environmental Health has reviewed the proposal and has recommended that prior to building permit issuance and vesting of the use permit, the applicant shall obtain a permit for the sewage disposal system. The system must be designed by a Registered Civil Engineer or Registered Environmental Health Specialist. Soils analysis, percolation and wet weather testing may be required. Wet weather groundwater testing may also be required. The sewage system shall meet peak flow discharge of the wastewater from all sources granted in the use permit and any additional sources from the parcel plumbed to the disposal system, and shall include the required reserve area. This is typically addressed as part of the building permit issuance process. The applicant has also noted that chemical toilets (portable toilets) will be utilized in addition for special events so as to minimize impacts to the on-site septic system. Additionally, all construction of buildings and wastewater systems require permits from PRMD which include erosion control and established standards to insure that no water quality standards/waste discharge requirements are violated.

Grading and septic permits shall be submitted to PRMD and are required to meet all applicable standards and provisions of the Sonoma County Code and all other applicable laws and regulations. The applicant shall show how the project will deploy construction site controls to prevent on- or off-site erosion or siltation. Also refer to discussion in items 9(c) through 9(e) of this checklist. The required measures will reduce potential water quality impacts to a level of less significant.

Mitigation: None required

b) Substantially	Potentially	Less than	Less than	No impact

deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?	Significant Impact	Significant with Mitigation Incorporation	Significant Impact	
			X	

Comment:

9.b Less Than Significant Impact: On December 30, 2015, a Project Water Use Analysis was prepared for the proposed project by Adobe Engineering, which concluded that the water demand for the proposed winery project would be estimated to be 16.7 acre feet per year. The winery wastewater will be recycled for irrigation purposes so the annual demand on the water wells would be 4,581,272 gallons or 14.06 acre feet per year.

Water Use Analysis:

Specifically, the proposed winery includes an annual production facility for 60,000 cases of wine, tasting rooms, marketing accommodations, 22 agricultural promotional events, and two industry wide events. The total ***annual*** water demand for the proposed project is estimated to be 5,445,272 gallons or 16.7 acre feet. The winery wastewater will be recycled for irrigation purposes so the ***annual*** demand on the water wells would be reduced to 4,581,272 gallons or 14.06 acre feet. The report provided a breakdown of water usage for the project using PRMD's Subsurface Waste Disposal System Design Criteria

Winery Production
Annual Water Use:
60,000 case production x 2.4 gallons per case x 6 gal water use/gal wine = 864,000 gallons

Peak Daily use During Crush:
60,000 x 2.4 x 1.5/60 day crush period = 3,600 gallons

Domestic Water:
Employees:
15 full time employees x 15 gal/day = 225 gal per day x 250 days/year = 56,250 gallons
3 part time employees x 15 gal/day = 45 gal per day x 150 days/year = 6,750 gallons
6 seasonal employees x 15 gal/day = 90 gal per day x 40 days/year = 3,600 gallons

Tasting Room Visitors:
75 peak, 25 average: 25 x 2.5 gallons x 365 = 22,813 gallons

Event Visitors:

Industry Wide 2 days x 300 visitors x 2.4 gallons =	1,500 gallons
2 events of 300 visitors x 2.5 gallons =	1,500 gallons
5 events of 120 visitors x 2.5 gallons =	1,500 gallons
5 events of 60 visitors x 5 gallons =	1,500 gallons
10 winemaker lunch or dinner of 30 visitors x 10 (incl. kitchen) =	3,000 gallons

Marketing Accommodations

2 rooms x 120 gal/room x 24 days per year =	5,760 gallons
Total Domestic Demand:	***104,083 gallons***

Geologic Report:

On January 5, 2017, a Geologic Report (Report) was prepared for the project by EBA Engineering. The Report explains the property is currently equipped with five water supply wells located along the eastern margin of the property (see Figure 2). These wells are identified herein as Wells #1 through #5 and are used to provide water for the on-site operations, and to two neighboring property owners to the west. Further details regarding the existing and proposed water use for the respective wells are provided as follows:

Well #1: Used solely for the proposed on-site development, including the winery and tasting room.
Well #2: Currently used to supply water to a single family dwelling located on a neighboring property to the west (APN 110-240-039). The water is provided under an Easement Grant Deed. This use will not change as part of the proposed project.
Well #3: Currently used to supply water for irrigation and frost protection for the on-site vineyards. Water from this well will also be used for landscape irrigation related to the proposed on-site development.
Well #4: Currently used to supply water to the various structures and garden on the western portion of property. This use will not change as part of the proposed project.
Well #5: Currently used to supply water for vineyard irrigation on a neighboring property to the west (APN 110-240-024). Similar to Well #2, the water is provided under an Easement Grant Deed. This use will not change as part of the proposed project.

Wells #2 through #5 were installed between 1988 and 1990, whereas Well #1 was installed in 2013. These wells range in depth from approximately 60 to 110 feet below ground surface (BGS).

Wells #1 and #3 will service the proposed development. Well #1 was installed in August 2013 and was constructed with a 50-foot sanitary seal, thereby making it suitable as a public water supply source for the proposed winery and domestic uses associated with the various facility operations. As a means of confirming its suitability for the proposed improvements, an 8-hour well capacity test was performed on January 16, 2014 by Petersen Drilling & Pump, Inc. that demonstrated a sustainable yield of 45 gallons per minute (GPM) with a resulting drawdown of 1.5 feet. Full recovery following the cessation of pumping was achieved within one hour. A copy of the test pump and recovery log documenting the test results is enclosed in Appendix B to the EBA Engineering report. Well #3 will be used for landscape irrigation. For Well # 3, pumping test data is not available, but, it has a reported yield of approximately 300 GPM.

A geologic map presented in Bulletin 118-4 (California Department of Water Resources [CDWR], 1983) indicates that the central and eastern portions of the project site area are underlain by Holocene alluvium (Qal) associated with the Russian River depositional system. The alluvium beneath and adjoining the Russian River are comprised of unconsolidated, coarse-grained gravel and sand deposits that can be highly permeable with reported yields in excess of 1,000 GPM. As you move away from the river, the alluvium contains less coarse-grained material and more silt and poorly sorted sands and gravel with lower permeability characteristics. Quaternary terrace deposits (Qt) are present along the western margin of the property that consist of cross-bedded deposits of sand and gravel originally formed as alluvial fan or stream channel deposits. Finally, the terrace deposits are bound to the west by rocks identified as the Jura-Cretaceous Franciscan Complex (KJ), which consist of sandstone, shale, greenstone, chert and serpentine. The Franciscan Complex underlies both the terrace deposits and alluvium in the area and typically exhibits very low yield characteristic (refer to Figure 3(Appendix A) for a geologic map).

The most prominent surface water feature in proximity of the project site is the Russian River, which borders the entire eastern boundary of the property. The Russian River is a managed water system as governed by State Water Resources Control Board (SWRCB) Decision 1610 (SWRCB, 1986) that receives regulated surface water discharges from Lake Mendocino and Lake Sonoma (via Dry Creek). Surface water flow in the Russian River is perennial in nature. As shown on Figure 2 (Appendix A), Wells #1 through #3 range from approximately 250 to 340 feet from the edge of the primary river channel, whereas the separation from Wells # 4 and #5 is approximately 70 feet. The project site is not located within one of the drought priority watersheds or reaches of interest identified in the State Water Resources Control Board's Russian River Tributaries Emergency Regulation. Table 1 below provides a summary of the project water demands based on Adobe's analysis in gallons per year and acre-feet per year measurements.

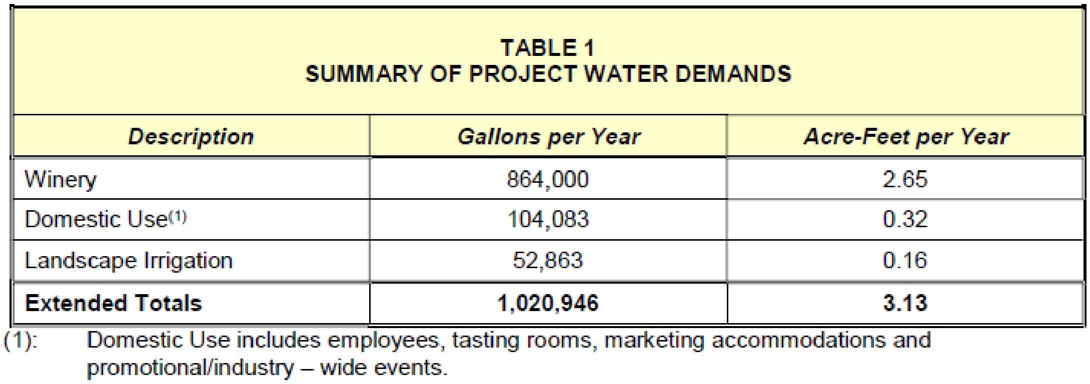

TABLE 1
SUMMARY OF PROJECT WATER DEMANDS

Description	***Gallons per Year***	***Acre-Feet per Year***
Winery	864,000	2.65
Domestic Use(1)	104,083	0.32
Landscape Irrigation	52,863	0.16
Extended Totals	**1,020,946**	**3.13**

(1): Domestic Use includes employees, tasting rooms, marketing accommodations and promotional/industry – wide events.

As previously noted, Well #1 will provide water supply for the winery and various domestic uses associated with the project. Based on the projections presented in Table 1, the total water demand for these sources equates to 1,020,946 gallons per year (GPY) or 3.13 acre-feet per year. In addition to total water use, the average daily and maximum peak daily demands were estimated using the same data. The average daily demand over a 365-day period equates to 2,652 gallons per day (GPD). The maximum peak daily demand, in turn, was estimated by combining applicable site activities that could theoretically occur in a given day. Information provided by the Applicant indicates that these activities could include: crush operations (3,600 GPD); promotional event visitors (300 GPD); tasting room visitors (63 GPD); marketing accommodations (240 GPD); and associated employees (360

GPD). This translates to a maximum peak daily demand of 4,563 GPD. Well #3 will be used for landscape irrigation. As outlined above, the projected total water demand for landscaping is 52,863 GPY. This translates to an average daily demand over a 365-day period of 145 GPD. In regards to the maximum peak daily demand, the maximum use occurs over the period of June through August (22,536 gallons). Assuming a conservative irrigation cycle of one day per week, the corresponding peak maximum daily demand equates to approximately 1,735 GPD.

EBA concludes that the water supply characteristics of the underlying aquifer utilized by Wells #1 and #3 are more than adequate to accommodate the water demands associated with the proposed project and will not result in negative impacts to local groundwater or surface water resources. This conclusion is based on the following variables:

1) The site is located within a Class 1 water area, which is identified in the Sonoma County General Plan as a major groundwater basin;

2) The underlying aquifer is comprised of alluvial deposits associated with the Russian River, which is a managed water system that ensures perennial flow throughout the year and serves as a continuous source of recharge to the aquifer;

3) Well capacity test results for Well #1 demonstrated a sustainable yield of 45 GPM while only inducing 1.5 feet of drawdown. This is indicative of a highly prolific aquifer system;

4) Based on the yield characteristics of the on-site wells, the wells will only have to pump for less than two hours (Well #1) and six minutes (Well #3) per day to accommodate the peak water flow demands; and

5) The projected radius of influence characteristics induced by the pumping operations will not encroach onto neighboring properties. In addition, the proposed water use is projected to induce no measureable changes in surface water flows in the Russian River.

The project is required to meet the WELO (Water Efficient Landscape Ordinance) standards prior to building permit issuance. The EBA report was found acceptable by PRMD staff. Based on the evidence in the Geologic Report prepared by a Senior Hydrologist with EBA Engineering, the project would not substantially deplete groundwater supplies or interfere substantially with groundwater recharge in the area and not induce measure changes in the surface water flows in the Russian River reducing potential impacts to groundwater to a level of less than significant.

EBA prepared a supplemental report evaluating potential impacts to the on-site wells that deliver water to neighboring properties to the west. This report concluded that the impacts of project pumping on these two wells would be de minimus. This report also concluded that the radius of influence of project pumping would not encroach onto neighboring off-site water wells, so there would no impact on such wells, and there would be no measurable changes in surface water flows in the Russian River. The EBA supplemental report was reviewed and found acceptable by PRMD staff.

Mitigation: None required

c) Substantially alter the existing drainage pattern of the site or area, including	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact

through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?		X		

Comment:

9.c Less Than Significant Impact with Mitigation Incorporated: The project includes grading, cuts and fills which require the issuance of a grading permit. Unregulated grading during construction has the potential to increase soil erosion from a site which could have adverse downstream flooding and further erosional impacts, and which could adversely impact downstream water quality.

There will be no modification of an existing waterway, nor would the project create runoff that would result in off-site or on-site flooding. All of the project development is located 950 feet or more away from the Russian River and located outside of the 200-foot Riparian Corridor setback requirement in the Zoning Code. On-site drainage patterns will not be substantially altered by the project. The project was reviewed by the Sonoma County PRMD Drainage Review Section. Grading and drainage improvement plans will be reviewed and approved by PRMD prior to the issuance of any development permits. As part of the grading plans, the applicant shall include an erosion prevention/sediment control plan which clearly shows best management practices to be implemented, limits of disturbed areas, vegetated areas to be preserved, pertinent details, notes, and specifications to prevent damages and minimize adverse impacts to the environment. These preventative measures include, but not limited to, prohibiting any tracking of soil or construction debris into the public right-of-way or drainages. Runoff containing concrete waste or by-products shall not be allowed to drain to the storm drain system, waterway(s), or adjacent lands. Erosion and sediment control measures are required to be included in the plans, limiting possible drainage impacts. Residue or polluted runoff from the crush pad or from production areas/activities shall not be allowed to drain directly to the storm drain system, waterway(s) or adjacent lands. Any waste water conveyance system shall not be allowed to be combined with the storm water conveyance system. Runoff from waste receptacles or outside washing areas shall not be allowed to drain directly to the storm drain system, waterway(s) or adjacent lands. Areas used for waste receptacles and outside washing areas shall be separated from the rest of the project site by grade breaks that prevent storm water run-on. Any surface water flow from a waste receptacle or outside washing area shall not be permitted to enter the storm drain system without receiving appropriate treatment. Handling, storage and any placement of cave spoils as fill will comply with State regulations and be subject to the Erosion and Sediment Control Plan required by Mitigation Measure 9(c).

Surface runoff will be routed through vegetated swales and vegetated buffer areas for treatment to mitigate pollutant loads per Sonoma County requirements. The overall increase in impervious area as a result of the project is insignificant when compared to the overall drainage basin tributary to the point of analysis on-site; therefore, surface water quantity is not expected to increase in adjacent water bodies. Surface runoff from the project site does not directly discharge into adjacent water bodies; therefore hydraulic changes are not anticipated.

County grading ordinance and adopted best management practices require grading applications and issued permits to depict and install adequate erosion prevention and sediment control best management practices. Required inspection by County inspectors insures that all work is constructed according to the approved plans. These ordinance requirements and adopted best management practices are specifically designed to maintain potential project water quantity impacts at a less than significant level during and post construction.

The proposed project has been designed and/or conditioned to prevent and/or minimize the discharge of pollutants or waste from the project site during construction. There are numerous storm water best management practices that can be utilized to accomplish this goal. These include measures such as silt fencing, straw wattles, and construction entrances to control soil discharges. Storm water best management practices also include primary and secondary containment for petroleum products, paints, lime and other materials of concern.
The applicant has submitted a preliminary report and plan to specify the location, type and approximate size of storm water best management practices necessary for the proposed project. The location of the storm water best management practices are site specific and predicated by the development. The type and approximate size of the selected storm water best management practices shall be in accordance with the adopted Sonoma County Best Management Practice Guide. The preliminary report and conceptual plan has been reviewed and approved by the Grading & Storm Water Section of the Permit and Resource Management Department, with conditions added as needed The listed storm water best management practices, pollutants and materials of concern are examples and do not represent a comprehensive listing of all available storm water best management practices.

The project will not alter the course of a stream or river. Storm water best management practices must be installed per approved plans and specifications, and working properly prior to each rainy season (October 15 each year) and remain functional throughout the rainy season, but may not be removed before April 15. The Permit and Resource Management Department will verify storm water best management practice installation and functionality, through inspections, throughout the life of the construction permit(s). Storm water best management practices shall be designed and installed pursuant to adopted Sonoma County Best Management Practice Guide reducing pontentially significant impacts to a level of less than significant.

The applicant has submitted stormwater management plan and fill placement drawings with the type and location of best management practices indicated. See project drawings at the end of this Final MND. The following mitigation measure will ensure that impacts are less than significant.

Mitigation Measure 9(c) 1: Prior to grading or building permit issuance, construction details for all storm water best management practices (BMPs) shall be submitted for review and approved by the Engineering Section of Permit Sonoma. The construction plans shall be in substantial conformance with the conceptual plan reviewed and approved at the planning permit stage.

The applicant shall submit an Erosion and Sediment Control Plan prepared by a registered professional engineer as an integral part of the planning plan, including cave excavation and stockpiling, transfer and placement of cave spoils as fill. The Erosion and Sediment Control Plan shall be subject to review and approval by Permit Sonoma prior to the issuance of a grading permit. The Plan shall clearly show limits of disturbed areas, vegetated areas to be preserved, pertinent details, notes, and specifications to prevent damage and minimize adverse impacts to the environment.

Tracking of soil or construction debris into the public right-of-way shall be prohibited. Runoff containing concrete waste or by-products shall not be allowed to drain to the storm drain system, waterway(s), or adjacent lands. The Erosion and Sediment Control Plan shall abide by and contain all applicable items in the Grading Permit Required Application Contents (GRD-004) handout.

Storm water BMPs must be installed per approved plans and specifications, and working properly prior to each rainy season (October 15 each year) and remain functional throughout the rainy season, but may not be removed before April 15.

Storm water BMPs shall be designed and installed pursuant to the adopted Sonoma County Best Management Practice Guide.

Mitigation Monitoring 9(c) 1: Permit Sonoma inspectors will ensure that selected erosion and sediment control measures are installed in a timely manner during project construction. The applicant shall be responsible for notifying construction contractors about erosion control requirements. Permit Sonoma will verify storm water best management practice installation and functionality, through inspections, throughout the life of the construction permit(s).

Mitigation Measure 9(c) 2: Excavation, handling, transport and/or any deposit of fill that involves soil or material containing naturally-occurring asbestos (serpentine) shall comply with all applicable State regulations and the provisions of the BAAQMD program, including but not limited to 17 CCR §93105.”

Mitigation Monitoring 9(c) 2: The Permit Holder shall be responsible for ensuring that all excavation, handling, transport and/or any deposit of fill that involves soil or material containing naturally-occurring asbestos (serpentine) complies with all applicable State regulations and the provisions of the BAAQMD program. If violations are found, PRMD shall seek voluntary compliance from the permit holder and thereafter may initiate an enforcement action and/or revocation or modification proceedings, as appropriate.

d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
			X	

Comment:

9.d Less Than Significant Impact: The project will not significantly alter drainage patterns on-site or in the general area, nor will it result in on- or off-site flooding. The project proposal does not include the alteration of a stream or river.

The proposed project has been designed and conditioned to prevent and/or minimize the discharge of pollutants and waste after the project is constructed (post-construction). Surface runoff will be routed through vegetated swales and vegetated buffer areas. Surface runoff from the project site does not directly discharge into adjacent water bodies; therefore hydraulic changes are not anticipated. There are numerous post-construction storm water best management practices that can be utilized to accomplish this goal. These range from project designs and/or

Low Impact Development (LID) best management practices that minimize new impervious surfaces, disperse development over larger areas, and/or that create areas that allow storm water to be detained, infiltrated, or retained for later use. Other post-construction storm water best management practices include storm water treatment devices based on filtering, settling or removing pollutants.

LID is a site design strategy that seeks to mimic the pre-development site hydrology through infiltration, interception, reuse, and evapotranspiration. LID techniques include the use of small scale landscape-based best management practices such as vegetated natural filters and bio-retention areas (e.g. vegetated swales and rain gardens) to treat and infiltrate storm water runoff. LID also requires preservation and protection of environmentally sensitive site features such as riparian buffers, wetlands, steep slopes, valuable trees, flood plains, woodlands, native vegetation and permeable soils.

The proposed project shall address water quality through storm water treatment best management practices and shall also address water quantity through storm water flow control best management practices. Storm water treatment best management practices shall be designed to treat storm events and associated runoff to the 85 percentile storm event. Storm water flow control best management practices shall be designed to treat storm events and associated runoff to the channel forming discharge storm event which is commonly referred to at the two year 24 hour storm event. Storm water treatment best management practices and storm water flow control best management practices are subsets of post-construction storm water best management practices. However, there is overlap between the two subsets. Post-construction storm water best management practices should utilize LID techniques as the first priority to the extent practicable such that they do not aggravate issues with slope stability.

The applicant has submitted a Preliminary Stormwater Mitigation Plan that states that drainage from the Ramey Winery parking area will be directed toward a drop inlet in the center island area that will outfall upslope of the existing pond. Runoff in the area of the turnout and driveway entrance will be directed toward an existing roadside swale along Westside Road. Runoff in the area of the tasting room improvements will be allowed to sheet flow through existing vegetation toward the eastern property line. There will be a slight increase in in runoff for the 2-year 24-hour storm as a result of the proposed improvements. The increase in the runoff for the area of the winery improvements will be captured in the existing pond. According to the Preliminary Stormwater Mitigation Plan, the existing pond has been evaluated and will have the capacity to capture the increase; treatment will be achieved by allowing the runoff to flow through vegetated buffer areas prior to entering the pond. There will be a slight increase in runoff east of the tasting room improvements that will filter through existing vegetation prior to exiting the property. Best Management Practices called for in the report call for preparation of a maintenance plan, preparation of an annual report, providing access to the property to regulatory agencies, and responsibility for remediation of problems.

The location of the storm water best management practices are site specific and predicated by the development. The type and approximate size of the selected storm water best management practices are in accordance with the adopted Sonoma County Best Management Practice Guide. The preliminary report and conceptual plan has been reviewed and approved by the Grading & Storm Water Section of the Permit and Resource Management Department, with conditions added as needed.

Proper operation and maintenance of post-construction storm water best management practices is needed to achieve the goal of preventing and/or minimizing the discharge of pollutants. Conditions of approval will require the proper maintenance and operation of post-construction storm water best management practices and annual reporting and certification to document proper maintenance and operation of post-construction storm water best management practices. Through the Building and Grading permit process and inspections, anticipated impacts from the proposed project including construction and post-construction activities will be reduced to less than significant level.

Mitigation: None required

e) Create or contribute runoff water which would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
			X	

Comment:

9.d Less Than Significant Impact: The proposed project has been conditioned to prevent and/or minimize drainage impacts through the proper design and installation of a storm water drainage system. Drainage impacts typically include storm water intrusion into structures, flooding of local roadways, soil erosion, standing water, and nuisance conditions for property owners and neighbors. Storm water drainage systems may take many forms such as site grading, swales, ditches, small or single run drain pipes, a piping system or network, or a combination of all these. The project will involve construction activities as described above, which are over 950 feet away from the Russian River located west of the proposed improvements.

On December 20, 2013, a Preliminary Storm Water Mitigation Plan (Plan) was prepared by registered civil engineers of Adobe & Associates (refer to Attachments). The Plan states that pollutants of concern include landscape and planting areas, and parking lots and driveways.

Source Controls:
The Plan explains that the project site’s runoff from on-site driveways, parking lots, and roofs will be directed to on-site vegetated buffer areas to allow for treatment. These Best Management Practices have been designed to meet the Sonoma County LID Manual requirements.

Channel Forming Discharge:
The Plan explains drainage from the winery parking area will be directed toward a drop inlet in the center island area that will outfall upslope of the existing pond. Runoff in the area of the turnout and driveway entrance will be directed toward an existing roadside swale along Westside Road.

The Plan explains runoff on the area of the tasting rooms will be allowed to sheet flow through existing vegetation toward the eastern property line. There will be a slight increase in runoff for the 2 year 24-hour storm as a result of the proposed improvements.

The increase in the runoff in the area of the Winery improvements will be captured in the existing on-site pond which has the capacity to capture the increase. Treatment will be achieved by allowing the runoff to flow through the vegetated buffer areas prior to entering the pond. There will be a slight increase in runoff east of the tasting room improvements that will filter through vegetation prior to exiting the property. Refer to attachment of the Plan.

Conclusion:
Adobe & Associates concludes that the runoff from the impervious roof and landscape areas will be directed towards the proposed vegetated buffer areas. Retention will not be required as there is not increase from the pre-construction to post-construction runoff conditions. The Best Management Practices proposed for this project, the vegetated buffer areas, will provide the treatment necessary to meet the County's LID requirements.

Furthermore, conditions of approval require that the construction plans include a storm water drainage system that adequately addresses drainage impacts (typically including storm water intrusion into structures, flooding of local roadways, soil erosion, standing water, and nuisance conditions for property owners and neighbors) and includes design features to control drainage in substantial conformance with the final drainage report. The design and sizing of the storm water drainage system shall be in compliance with the adopted Sonoma County Water Agency Flood Control Design Criteria, 1983 or most recently revised edition.

The construction plans and final drainage report shall be prepared by a civil engineer, registered in the State of California, be submitted with the grading and/or building permit application and/or improvement plans, as applicable, and be subject to review and approval by the Grading & Storm Water Section of the Permit and Resource Management Department prior to the issuance of any grading or building permits. At the time of improvement plan submittal or grading or drainage permit application, the applicant shall submit a final stormwater and drainage report for the proposed project. A typical drainage report will include a project narrative, on- and off-site hydrology maps, hydrologic calculations, hydraulic calculations, pre- and post-development analysis for all existing and proposed drainage facilities. The drainage report shall abide by and contain all applicable items in the Drainage Report Required Contents (DRN-006) handout. Through the Grading permit process and best management practices required to be implemented under this permit, the proposed development would not substantially alter drainage patterns or capacities of the project site, or result in substantial additional sources of polluted runoff reducing potential impacts to a level of less than significant.

Mitigation: None required

f) Otherwise substantially degrade water quality?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
			X	

Comment:
9.f Less Than Significant Impact: (Refer to discussion above in items 6.e. and 9.a. and 9.e. above in this initial study checklist). Drainage from the winery parking area will be directed toward a drop inlet in the center island area that will outfall upslope of the existing pond. Runoff in the area of the turnout and driveway entrance will be directed toward an existing roadside swale along Westside Road. Runoff in the area of the tasting room improvements will be allowed to sheet flow through existing vegetation toward the eastern property line. The increase in the runoff in the area of the winery improvements will be captured in the existing pond. The existing pond has been determined to have the capacity to capture the Delta Volume increase; treatment will be achieved by allowing the runoff to flow through vegetated buffer areas prior to entering the pond.

Because all development will be 950 feet or more away from the Russian River and with the requirements under the Building and Grading permit, the project would not substantially degrade water quality.

Mitigation: None required

	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
g) Place housing within a 100-year hazard area as mapped on a federal Flood hazard Boundary of Flood Insurance Rate Map or other flood hazard delineation map?			X	

Comment:
9.g. Less Than Significant Impact: The project property is located within Flood Zone AE and Zone X as shown on FEMA flood maps (FIRM Panel No. 06097C0563E, December 2, 2008), however, the development area of the project site is not located in a flood hazard area, being located just east of the identified flooding boundary. See discussion below under item 9(h) for mitigation requirements associated with flood hazards.

Mitigation: None required

	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?			X	

Comment:
9.h. Less Than Significant Impact: General Plan Public Safety Element Policy PS2l states “On-site and off-site flood related hazards shall be reviewed for all projects located within areas subject to known flood hazards.”

General Plan Public Safety Element Policy PS2m states “Regulate development; water diversion; vegetation management; grading and fills to minimize any increase in flooding and related damage to people and property.”

The project site on the east side of the road is designated in the F1 (Floodway) or F2 (Secondary Floodplain) overlay zoning designations. However, the project Site Plan demonstrates that the project development will be setback outside of these areas.

The wine cave and location of the cave spoils are located on the west side of the road and not located in the F1 or F2 overlay zoning designations. The project Proposal Statement and Project Site Plans depict the locations of the proposed wine cave and cave spoils.

The PRMD Grading & Stormwater Section has reviewed the proposed project and has indicted that portions of the proposed project are located within a Special Flood hazard Area (SFHA) and is affected by flooding from the Russian River. It was noted that no fill shall be placed with a SFHA unless an engineering analysis demonstrates that no reduction in the flood storage capacity within the SFHA will result from the fill placement and related improvements. Any land subject to inundation by a SFHA shall be delineated and shown on the grading plans as “SUBJECT TO INUNDATION” in one inch lettering. The base flood elevation is estimated to be at 79 feet above mean sea level. The grading plans shall show all elevations based upon the North American Vertical Datum of 1988 (NVGD 88).

As noted above, and as described in the Proposal Statement and depicted on the Project Plans, the project will not result in the placement of permanent structures intended for human habitation or residential units within the floodway as identified on the FEMA FIRM Map. The only improvements that will be placed within the floodway will include landscaping and both the permanent parking field and the overflow parking area. All other improvements will be placed outside of the floodway. However, the applicant did note that picnic tables would be seasonally placed in the walnut grove near the Russian River, which would be in the floodway. These are not structures and would be only placed in this area seasonally to correspond with non-winter months and would be removed prior to winter and thus not resulting in any encroachments placed in the floodway. Provided compliance with the recommendations of the Grading and Stormwater Section of PRMD are adhered to, no significant impacts are anticipated and such impacts would be reduced to less than significant level.

Mitigation: None required

	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?		X		

Comment:

9.i. Less Than Significant Impact: The eastern portion of the project site is located in an area subject to flooding or inundation as a result of dam failure (See General Plan Public Safety Element Figure PS1f). This affects the entire Russian River watershed due to Warm Springs Dam and Lake Mendocino to the north. The project site is located south of the Warm Springs Dam. Warm Springs Dam regulates the headwaters of Dry Creek. It was built in 1982 and forms Lake Sonoma Reservoir which holds a water supply of 212,000 acre-feet and a flood pool of 130,000 acre-feet. It is owned by the US Army Corps of Engineers (USACE). Water supply releases from this dam are controlled by the Sonoma County Water Agency (SCWA), with the exception of water released for flood control, which is managed by the Corps. In September 2014, after the recent Napa earthquake (2014), engineers with the Army Corp of Engineers inspected the dam structure and determined the dam remains structurally sound with no damage from the recent earthquake. With the dam oversight and continued inspection by the Corp engineers, it’s highly unlikely the project site would be significantly impacted by a failure of the Warm Springs Dam.

Furthermore, as discussed above in item 9(h), no permanent structures will be placed within the floodway or floodplain areas. However, the existing hop kiln and baling barn are located on the east side along with the proposed parking fields and landscaping. The winery and associated wine cave will be located on the west side of the property outside of the dam inundation zone. All improvements and substantial improvements shall be established in compliance with Chapter 7b of the County Code and shall be designed by a registered civil engineer to address compliance with the County’s Flood Damage Prevention section of the County Code. Specifically all improvements and substantial improvements shall be designed to be adequately anchored to prevent floatation, collapse or lateral movement of the structure, resulting from hydrodynamic and hydrostatic loads, including effects of buoyancy.

Mitigation: None required

j) Inundation by seiche, tsunami, or mudflow?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
				X

9.j No Impact. The project site is located in the Russian River Valley, not located in the coastal area which is an subject to seiche or tsunami hazards. Mudflows can be triggered by heavy rainfall, earthquakes or volcanic eruption in areas of hillside. The project site is located on the valley floor and not in an area prone to or history of seiche, tsunami, or mudflow hazards.

Mitigation: None required

10. LAND USE AND PLANNING - Would the project:

a) Physically divide an established community?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
				X

Comment:
10.a Less Than Significant Impact. The project site is within a rural, unincorporated area in the western portion of Sonoma County, several miles southwest of Healdsburg. The project would not divide an established community.

Mitigation: None required

b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
			X	

Comment:
10.b. Less Than Significant Impact: (Also refer to discussion under items with regard to the project site's combining zones: 3 Biological Resources, 5 Cultural Resource, and 9 Hydrology and Water Quality). The General Plan land use designation for the site is LIA 60 (Land Intensive Agriculture, 60/100-acre minimum density), with a Zoning designation of the property is LIA B6 60, F1, F2, RC200/100, SR, VOH (Land Intensive Agriculture, 60-acre

minimum density, Combining Districts). The RC combining zone is established to protect biotic resource communities, including critical habitat areas within and along riparian corridors, for their habitat and environmental value, and to implement the provisions of the General Plan Open Space and Resource Conservation and Water Resources Elements. The “200/100” under the RC designation references a 200 foot minimum streamside conservation area shown in the zoning database, and a 100 foot minimum setback for agricultural cultivation. The F1 combining district is in reference to a portion of the property (area along the Russian River) lying within a floodway. The F2 combining district is in reference to a portion of the project site lying within the identified 100-year floodplain. The SR combining district is in reference to the frontage of the property along Westside Road having a Scenic Resources designation. The property also has a Valley Oak Habitat Combing District (VOH) designation, which addresses the protection and enhancement of valley oak woodlands.

This designation and zoning allows agricultural product processing, wineries, tasting rooms, and special events as conditional uses. The applicants are seeking approval of a Conditional Use Permit for the establishment of a winery, wine caves, tasting facility and marketing accommodation which will be located on both east and west side of the property. Specifically, the project include a new winery and wine caves on the west side of Westside Road, and on the east side of Westside Road will involve the re-purposing/refurbishing of the existing hop kiln into a tasting room and the refurbishing of the hop baling barn into a private tasting room with a two-guest room marketing accommodations. This includes the construction of additional parking, driveways and the enlarging of the existing driveways in order to meet fire safe standards. The proposal also includes 24 agricultural promotional events with a range of guests (10 events and 30 guests, 5 events with 60 guests, 5 events with 120 guests, and 2 events with 300 guests) and participation in industry-wide events totaling two day events with a maximum of 300 guests.

The following consistency analysis evaluates each of the proposed uses in the project.

Winery and Tasting Facility: The proposed winery and tasting facility use is consistent with the LIA requirements. It will continue as an ancillary use to the existing vineyard with the production of grapes which are grown on site and in the general region, totaling approximately 42 acres out the 75-acre parcel. The proposed project is consistent with the General Plan’s Agricultural Element Goals, Objectives and Policies, which include the following:

“Policy AR-4a: The primary use of any parcel within the three agricultural land use categories shall be agricultural production and related processing, support services, and visitor serving uses. Residential uses in these areas shall recognize that the primary use of the land may create traffic and agricultural nuisance situations, such as flies, noise, odors, and spraying of chemicals.”

Comment: The project site is within the LIA General Plan land use category, and the primary proposed use would retain existing residential and vineyard with the addition of a winery, wine caves and tasting room facility to process and promote local wine grapes. The primary potential land use conflicts associated with the wineries and adjacent residences are noise, traffic, odor and light. Conditions and mitigation measures have been added to the proposed project to address light (exterior lighting shall be low mounted, downward casting and fully shielded to prevent glare). Noise generated by the proposed tasting facility and associated events must be controlled in accordance with the standards set in the Noise Element of the Sonoma County General Plan. Traffic conditions are addressed in the Transportation section of this Initial Study.

“GOAL AR-5: Facilitate agricultural production by allowing agriculture-related support uses, such as processing, storage, bottling, canning and packaging, and agricultural support services, to be conveniently and accessibly located in agricultural production areas when related to the primary agricultural production in the area.”

Comment: The proposed winery and wine tasting facility and associated promotional events would be located in an area primarily in agricultural uses, included planted in vines. The proposal would create a consolidated facility with both the growing of grapes, processing and marketing of the product grown on-site.

“Objective AR-5.1: Facilitate County agricultural production by allowing agricultural processing facilities and uses in all agricultural land use categories.”

Comment: The subject site is designated as LIA, which is considered one of the primary agricultural land use designations.

“Policy AR-5a: Provide for facilities that process agricultural products in all three agricultural land use categories only where processing supports and is proportional to agricultural production on site or in the local area.”

Comment: The site has an agricultural land use designation, LIA, grapes produced on-site and from the local area would processed and bottled on-site once the proposed winery and associated cave are constructed. Of the 75 acre parcel, approximately 42 acres are currently planted in grapes, of the remaining 33 acres, 3.75 total acres is comprised of existing and proposed development, which is 5 percent of the total parcel size. The processing component is in proportion to the on-site agricultural production. None of the existing vineyard will be removed to accommodate the proposed uses or site infrastructure. The processing component is in proportion to the on-site agricultural production.

Policy AR-5c: Permit storage, bottling, canning, and packaging facilities for agricultural products either grown or processed on site provided that these facilities are sized to accommodate, but not exceed, the needs of the growing or processing operation. Establish additional standards in the Development Code that differentiate between storage facilities directly necessary for processing, and facilities to be utilized for the storage of finished product such as case storage of bottled wine. Such standards should require an applicant to demonstrate the need for such on-site storage.

Comment: The proposed project would result in the construction of a 60,000 case winery and associated caves, where such products would be marketed and sold on-site.

Policy AR-5g: Local concentrations of any separate agricultural support uses, including processing, storage, bottling, canning and packaging, agricultural support services, and visitor-serving and recreational uses as provided in Policy AR-6f, even if related to surrounding agricultural activities, are detrimental to the primary use of the land for the production of food, fiber and plant materials and shall be avoided. In determining whether or not the approval of such uses would constitute a detrimental concentration of such uses, consider all the following factors:

1. *Whether the above uses would result in joint road access conflicts, or in traffic levels that exceed the Circulation and Transit Element’s objectives for level of service on a site specific and cumulative basis.*

Comment: Within one-half mile of the project site there are three existing wineries, one proposed winery, and a stand-alone tasting room. Out of these sites, only two of the existing wineries were approved to hold events.

Within a 1.5 miles radius from the project site also located on Westside Road, there are nine existing wineries with tasting rooms and events, and one proposed winery with a tasting room and events.

Winery Name	File Number	Location	Annual Case production	Tasting Room/Hours	Events yes/no Event Specifications
South of Project Site					
Williams-Selyem Winery	PLP04-0062	7227 Westside Rd	35,000 cases	Tasting hours 10AM - 5 PM	No
Porter Creek Vineyards	UPE86-0136	8735 Westside Rd	9,000	10 AM – 4 PM	? No

Lands surrounding the subject property are residential and agricultural with vineyards and wineries. A Traffic Impact Study was prepared for the project by W-Trans, who concludes that based on their review and analysis performed, it’s anticipated that the project will have a limited impact on traffic operation along Westside Road, and the project will generate fewer special event trips than that of the previous use for Westside Farms pumpkin farm. W-Trans explains that Westside Farms was the previous owner who held harvest market each fall which included a pumpkin patch, hay rides, and sales of hand-crafted foods and gift items. This event lasted the month of October each year and drew up to 600-persons on a peak day. According to W-Trans the prior use generated substantially more event traffic during the month of October than the currently proposed project will generate over a course of an entire year. The proposed project is not expected to significantly contribute to roadway conflicts or result in traffic levels of service beyond County standards. (See Transportation section, below, for further discussion.)

2. *Whether the above uses would draw water from the same aquifer and be located within the zone of influence of area wells.*

Comment: Specifically, the proposed winery includes a production facility for 60,000 cases of wine, tasting rooms, marketing accommodations, 22 agricultural promotional events, and two industry-wide events. The total annual water demand for the proposed project is estimated to be 5,445,272 gallons or 16.7 acre feet. The winery wastewater will be recycled for irrigation purposes so the annual demand on the water wells would be reduced to 4,581,272 gallons or 14.06 acre feet according to the water analysis prepared by Adobe & Associates.

On January 5, 2017, a Geologic Report (Report) was prepared for the project by EBA Engineering. The Report explains the property is currently equipped with five water supply wells located along the eastern margin of the property (see Figure 2). These wells are identified herein as Wells #1 through #5 and are used to provide water for the on-site operations, and to two neighboring property owners to the west. EBA concludes that the water supply characteristics of the underlying aquifer utilized by Wells #1 and #3 are more than adequate to accommodate the water demands associated with the proposed improvements and will not result in negative impacts to local groundwater or surface water resources. This conclusion is based on the following factors:

1) The site is located within a Class 1 water area, which is identified in the Sonoma County General Plan as a major groundwater basin;

2) The underlying aquifer is comprised of alluvial deposits associated with the Russian River, which is a managed water system that ensures perennial flow throughout the year and serves as a continuous source of recharge to the aquifer;

3) Well capacity test results for Well #1 demonstrated a sustainable yield of 45 GPM while only inducing 1.5 feet of drawdown. This is indicative of a highly prolific aquifer system;

4) Based on the yield characteristics of the on-site wells, the wells will only have to pump for less than two hours (Well #1) and six minutes (Well #3) per day to accommodate the peak water flow demands; and

5) The projected radius of influence characteristics induced by the pumping operations will not encroach onto neighboring properties. In addition, the proposed water use is projected to induce no measureable changes in surface water flows in the Russian River.

3. *Whether the above uses would be detrimental to the rural character of the area.*

Comment: The site of the new winery and tasting facility is to be located within an area primarily developed with single family residences, vineyard, wineries, tasting rooms, and small family farms. The project includes the refurbishing of the existing hop kiln and baling barns and the construction of a new winery and wine caves that will be constructed in such a manner that will create a low profile winery building. No vines would be removed to accommodate the project. As discussed in the Cultural Resource section of this initial study, preliminary review was done by both the Sonoma County Landmarks Commission and the Design Review Committee who had no objection to the project proposal. Both Committees had recommendations in terms of overall project design and the final plans need to be reviewed by both Committees in a joint meeting.

Under the Aesthetics section of this Initial Study, the impacts from the project are expected to be no impact to less than significant. The location and scale of the proposed wine tasting facility use would result in the refurbishing of existing structures and are situated below road grade and the architecture to be employed would result in retaining the original architecture of the barns thus not altering the character of the property and surrounding properties.

Based on the size of the winery's annual case capacity and sensitivity analysis done by the traffic engineer for events, with mitigation incorporated into the project, there are no significant traffic impacts. Based on the above information the proposed project will not be detrimental to the community character or result in an over concentration of wineries in the near vicinity.

"Policy AR-6d: Follow these guidelines for approval of visitor serving uses in agricultural areas:

1. *The use promotes and markets only agricultural products grown or processed in the local area.*

Comment: The applicant has indicated that "the Ramey Winery is currently housed in two leased buildings in the City of Healdsburg and produces 40,000 cases of wine annually with its own staff and equipment. The wine has been widely critically acclaimed and is distributed nationally and internationally." Grapes grown and harvested at the site are currently processed elsewhere, but once the winery is constructed, the processing would occur on-site as a finished product for sale/tasting during daily operation of the facility as well as during industry events. There will be no weddings at the site, but rather agricultural industry events promoting the wine.

2. *The use is compatible with and secondary and incidental to agricultural production activities in the area.*

Comment: The primary agricultural production activity in the project area is vineyards for the processing of wine. Because the proposed tasting facility would facilitate the sale and promotion of agriculture products grown on the site, the facility itself would be located within existing barns that would be refurbished and overflow parking would only be utilized for events and not change or alter the use of the vineyard, it is considered incidental and secondary to the agricultural and residential activities on-site and in the area. No aspects of the existing agricultural use will be displaced by the proposed use.

3. *The use will not require the extension of sewer and water.*

Comment: The use will be served by on-site septic system and water. Extension of sewer and water lines will not be required.

4. *The use is compatible with existing uses in the area.*

Comment: The tasting room will operate only during normal business hours, but will however include up to 22 agricultural events with a range of guests and two industry wide events, with a maximum of up to 300 people per event. These events would occur throughout the year and will not be concentrated in any one month. Event noise such as concerts and weddings are not planned, nor requested, at the winery. The winery does plan to participate in two industry- wide events per year. Although the project would utilize amplified music and speech, mitigations include: (1) amplified music and speech at events only occur during daytime hours within the baling barn or tasting room buildings; (2) outdoor events in the vicinity of the winery with non-amplified outdoor music and/or speech may occur outdoors during daytime hours (7:00 a.m. to 10:00 p.m). With the mitigations noted above, the facility and the infrequent number of events throughout the year, with all parking to be contained on-site, the project/use should not be disruptive to neighbors. The project site is the former Westside Farms that was once a pumpkin patch that during the month of October on busy weekends would attract hundreds of people.

5. *Hotels, motels, resorts, and similar lodging are not allowed.*

Comment: The proposed project does not include any overnight marketing accommodations open to the public. The wine tasting facility will provide for marketing accommodations, located on the upper floor of the barn, with two guest rooms. These will only be made available to wine industry representatives on a limited basis.

6. *Activities that promote and market agricultural products such as tasting rooms, sales and promotion of products grown or processed in the County, educational activities and tours, incidental sales of items related to local area agricultural products are allowed.*

Comment: The project includes the establishment of a new tasting room proposed for sales and marketing that promotes local wine. The proposal will also include up to 22 agricultural promotional events per year with a range of guests (10 events and 30 guests, 5 events with 60 guests, 5 events with 120 guests, and 2 events with 300 guests) and participation in industry-wide events totaling two day events with a maximum of 300 guests on property totaling 75 acres.

The project as proposed is consistent with the General Plan and Zoning Ordinance policies related to agricultural processing facilities and related visitor serving uses. Mitigation measures and monitoring have been incorporated into this Initial Study to reduce potential environmental impacts; thus potential conflicts with land use and zoning policies are considered less than significant. The existing vineyard operation is a permitted use and is not a part of the project or subject to CEQA requirements.

Mitigation: None required

c) Conflict with any applicable habitat conservation plan or natural community conservation plan?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
				X

Comment:
10. c No Impact. Habitat conservation plans and natural community conservation plans are site-specific plans to address effects on sensitive species of plants and animals. The project site is not located in an area subject to a habitat conservation plan or natural community conservation plan.

Mitigation: None required

11. MINERAL RESOURCES *Would the project:*

a) Result in the loss of availability of a	Potentially	Less than	Less than	No

known mineral resource that would be of value to the region and the residents of the state?	Significant Impact	Significant with Mitigation Incorporation	Significant Impact	impact
				X

Comment:
11.a. No Impact. There are no known mineral resources on the project site. The site is not designated in an MR (Mineral Resource) zoning district.

Mitigation: None required

b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
				X

Comment:
11.b. No Impact. The project site is not locally designated as a mineral resource. The site is not designated in an MR (Mineral Resource) zoning district.

Mitigation: None required

12. NOISE - Would the project:

a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
		X		

Comment:
12. a. Less Than Significant Impact with Mitigation Incorporated. The Noise Element of the Sonoma County General Plan establishes goals, objectives and policies including performance standards to regulate noise affecting residential and other sensitive receptors. The general plan sets separate standards for transportation noise and for noise from non-transportation land uses.

A Noise Assessment was prepared by Illingworth & Rodkin, Inc., on October 2013, revised September 2015, and revised again on February 8, 2017. On August 16, 2017, an Addendum to the Environmental Noise Assessment was submitted by Ilingworth and Rodkin to consider noise impacts to another existing residence located at 7181 Westside Road immediately south of the project site (see Residence 4 in Figure 1 in the Addendum dated August 16, 2017).

The Noise Assessments evaluated the existing noise environment and the potential for increased noise as a result of the proposed winery project for property located at 7097 Westside Road. The proposed project includes production of 60,000 cases of wine, tasting room, retail sales, and an area designated for trade-related events. On the eastern side of Westside Road, the existing hop kiln will be converted into a public tasting room, and the baling barn is to be converted into a private tasting room with a two room marketing accommodation on the upper floor. The two buildings are to be connected by a pedestrian bridge, which is part of the construction project. On the western side of the roadway, a new 60,000 winery production facility with a wine cave area for wine barrel storage. The west-side facilities are not to be open to the public, except by private invitation. Additionally, entryways, driveways, parking, walkways and site accessibility features are included in the project.

The winery operations will include public tastings, retail sales, and trade-related events. The staff will include 15 employees between the winery and the tasting room. On Average 52 visitors per day is expected for tasting. The project includes provisions for 22 agricultural promotional events and two industry wide events.

The winery is situated on a 75-acre parcel of land formerly occupied by Westside Farms. The property is bordered to the northwest by Arista Winery, to the south west by Williams-Selyem Winery, and to the south and east by the Russian River. On the opposite side of the river is Riverfront Regional Park. To the south of the property lie single-family residences.

Noise sensitive receptors include four nearby residences within the project vicinity. The noise assessment noted that the primary ambient source of noise in the project area is the traffic along Westside Road. Other contributors to noise include air planes flying overhead, and agricultural-related activities in the area.

The Sonoma County General Plan Noise Element identifies a goal to:

“Protect people from the adverse effects of exposure to excessive noise and to achieve an environment in which people and land uses function without impairment from noise.”

The following General Plan policies, which are applicable for use at the project, are intended to achieve this goal include:

NE-1c: Control non-transportation-related noise from new projects. The total noise level resulting from new sources shall not exceed the standards in Table NE-2 of the recommended revised policies as measured at the exterior property line of any adjacent noise-sensitive land use.

According to the Nosie Assessment, there are a number of operations associated with the proposed winery, tasting rooms, and events that will produce noise. These include:

1. Project traffic noise;
2. Winery and seasonal production operations;
3. Maintenance and forklift operations; and
4. Special event noise

Project Traffic Noise:
The noise assessment examined Project Traffic, specifically traffic associated with parking lot and truck traffic noise. According to the assessment, on the east side of Westside road where the

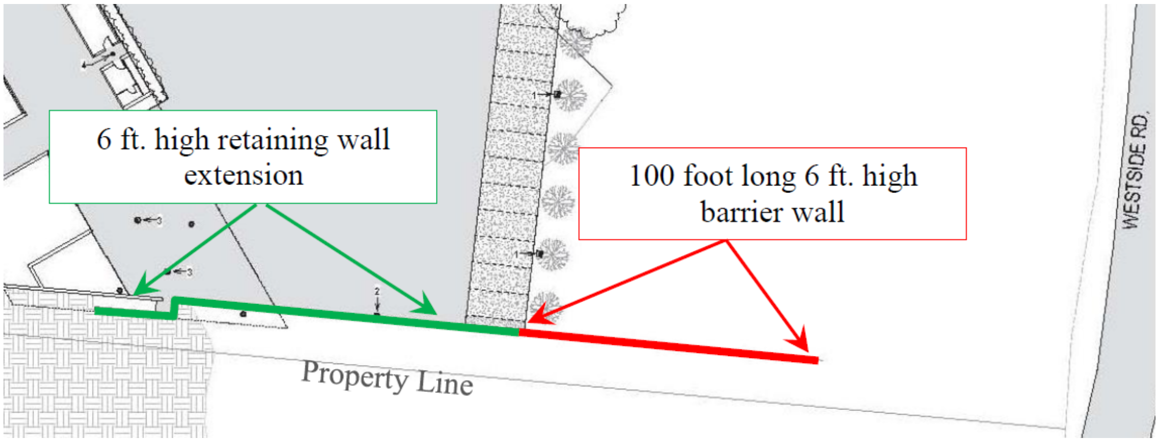
tasting room and office and industry accommodations are located, the existing driveways and parking areas will be used. The parking lot will be improved, but the general location will remain the same. Residence 1, located at the southern boundary of the winery property is approximately 960 feet from the nearest parking area; Residence 2, located further south along Westside road and Residence 3 are located approximately 1,220 and 1,210 feet, respectively from the nearest parking area. Based on these distances, noise generated by automobile and light vehicles would be between 28 and 38 dBA at residence 1 and between 25 and 35 dBA at both residence 2 and 3. Given the expected visitor and employee use, these activities are expected to occur for less than five minutes out of an hour on a typical day and fall in the L02 NE-2 daytime category of 65 dBA. However, during events or on busy weekends, such activities may occur more frequently and fall into the L08 NE-2 daytime category of 60 dBA. Based on this finding, noise levels associated with automobiles and light vehicles using the project driveways and parking lots would not exceed the daytime NE-2 noise standards at the nearest residence.

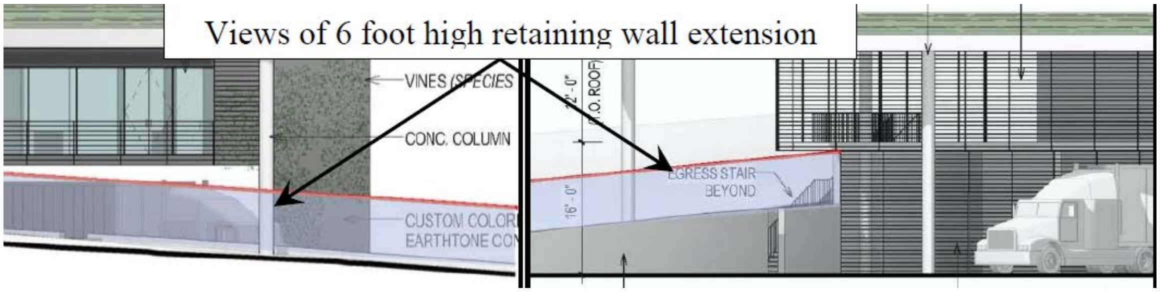
Relative to truck traffic, trucks visiting the project site will use the new driveway to access the winery facility on the west side of the roadway. The main winery access path will take constant speed and maneuvering trucks within respective distances of approximately 1,170 to 1,335 feet of Residence 1, 1,290 to 1,595 feet of Residence 2, and 1,200 to 1,515 feet of Residence 3. Utilizing these distances, noise generated by heavy duty trucks may range from 48 to 56 dBA at Residence 1 and from 47 to 55 dBA at both Residence 2 and 3. Truck operations are expected to occur during daytime hours only and on a basis of one to five minutes per hour, or less, since it is unlikely that more than one heavy truck would arrive and depart during any given hour. Thus truck operations would fall in the L02 NE-2 category of 65 dBA at these three adjacent residential uses.

For Residence 4, in the Addendum submitted by Illingworth and Rodkin dated August 16, 2017 (August 2017 Addendum); noise levels associated with automobiles and light vehicles using the project driveways and parking lots would not exceed the daytime NE-2 noise standards at the property line.

Based on these findings, noise associated with truck traffic at the project is not expected to exceed daytime NE-2 noise standards at Residences 1, 2, and 3. However, in the August 2017 Addendum, Ilingworth and Rodkin explain the noise associated with medium truck traffic at the project is not expected to exceed daytime NE-2 noise standards at the property line of Residence 4 located at 7181 Westside Road, however heavy truck traffic would exceed these standards by up to 5 dBA and mitigation is required. Trucks visiting the winery site will use the new driveway and parking , truck loading and turn around area to access the wine production facility on the west side of the roadway. The centerline of the main winery access path will take constant speed and maneuvering trucks within 50 feet from the property line of Residence 4. However, at this close proximity the proposed retaining wall at the edge of the parking / truck turn around area will act as a partial barrier to property line truck noise. Where truck noise is unshielded by the retaining wall the distance from the centerline of the main winery access path to the property line is 90 feet. Using this closest unshielded distance, noise generated by heavy-duty trucks may range from 65 to 70 dBA and medium-duty trucks may range from 55 to 60 dBA at the property line of Residence 4. Truck operations are expected to occur during daytime hours only and on a basis of one to five minutes per hour, or less, since it is unlikely that more than one heavy truck would arrive and depart during any given hour. Thus, truck operations would fall in the L02 NE-2 category of 65 dBA (see Table 2 in the Addendum report).

Illingworth and Rodkin concludes, based on these findings, that noise associated with medium truck traffic at the project is not expected to exceed daytime NE-2 noise standards at the property line of Residence 4, however heavy truck traffic would exceed these standards by up to 5 dBA. Mitigation is required to reduce the noise levels from heavy trucks.





***Mitigation for Truck Noise Attenuation**: To reduce noise levels from heavy trucks using the truck loading and turn around area the height of the retaining wall on the south side of the loading area should be extended to 6 feet above existing (above retaining wall) grade. A wall with a height of 6 feet above the existing ground level should then be extended for 100 feet parallel to the property line as shown in Figure 2 above*

<u>Winery Mechanical Equipment</u>:
Relative to mechanical equipment noise, the winery will include noise-generating mechanical equipment, such as air-cooled condensing units, pumps and compressors, as well as, less-significant sources of noise, such as air-conditioning systems and exhaust fans. The project description and drawing do not indicate the precise location of such equipment. The equipment may be located within the structures or positioned so that the structures provide shielding for noise caused by the equipment. The noise assessment considered the “worst-case scenario” where the equipment is placed outside of production buildings and not shielded from the adjacent residences, the equipment may be located as close as 1,210 feet from Residence 1, as 1,300 feet from Residence 2, and as close as 1,170 feet from Residence 3. The assessment indicates that constant L_{50} noise levels from mechanical equipment may be between an L_{50} of 32 and 34 dBA at Residence 1 and 2 and between an L_{50} of 33 and 35 dBA at Residence 3.

However, in the August 2017 Addendum, Ilingworth and Rodkin explain the noise associated with mechanical equipment is expected to exceed daytime or nighttime NE-2 noise standard at the property line of Residence 4 located at 7181 Westside Road and mitigation is required.

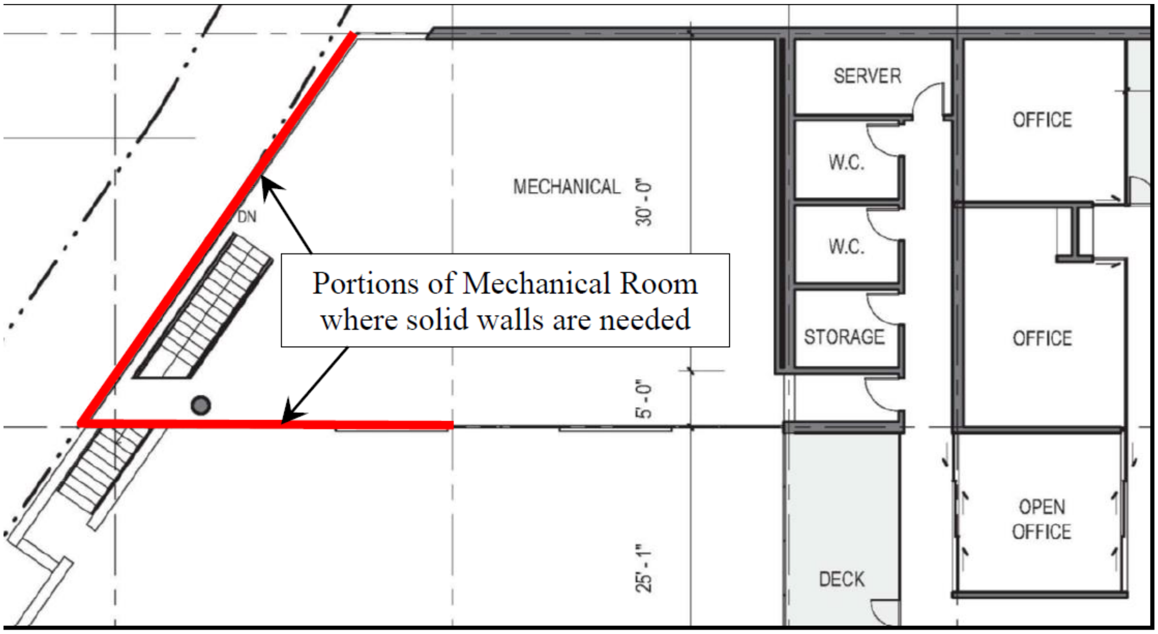


Figure 3: Mechanical Room Mitigation

***Mitigation for Mechanical Equipment Room**: The southern façade and part of the eastern façade (to cut line 9 as shown in the project drawings) of the Mechanical Equipment Room of the winery building should constructed as solid walls.*

Winery Crush-Related Noise:
Annual crush-related activities would take place within the new wine production building. The crush pad & press equipment room will be located on the first floor and on the western side of the building, which indicates considerable shielding of crush-related noise by the building itself from nearby residences. Based on the winery floor plan, the space above the crush pad will be open to the second floor, but it is unclear if the area will be open or closed to nature. Assuming the worst case scenario, crush-related activities will be considered to occur outdoors. The future crush pad was estimated to be within 1,280 feet of Residence 1, within 1,400 feet of Residence 2 and within 1,275 feet of Residence 3. Constant L50 noise levels from crush-related activities would be approximately 38 dBA at Residence 1, 37 dBA at Residence 2, and 38 dBA at Residence 3. The maximum noise events discussed above, such as bin drops, etc., would be an L02 of 42 to 52 dBA at Residence 1, 41 to 51 dBA at Residence 2, and 42 to 52 dBA at Residence 3.

In the August 2017 Addendum, Ilingworth and Rodkin explain noise levels from crush-related activities would be 56 dBA at the property line of Residence 4 located at 7181 Westside Road. The maximum noise discussed in the original Noise assessments, such as bin drops, etc., would be an L02 of 60 dBA at the property line of Residence 4 and the noise associated with crush related noise is not expected to exceed daytime or nighttime NE-2 noise standard at the property line of Residence 4.

Based on these findings, noise associated with crush-related noise is not expected to exceed daytime or nighttime NE-2 noise standard at the nearest residence and no mitigation is needed.

Bottling Noise:
Bottling will be done in the production facility area, next to the truck access loading zone. The building will provide shielding from noise created during bottling activities. The distances from the

bottling area to nearby residences are as follows: 1,225 feet from Residence 1, 1,345 feet from Residence 2, and 1,200 feet from Residence 3. Based on these distances and noise shielding, noise from bottling activities are expected to be an L_{50} of 37 to 42 dBA at Residence 1, an L_{50} of 36 to 41 dBA at Residence 2, and an L_{50} of 37 to 42 at Residence 3.

In the August 2017 Addendum, Ilingworth and Rodkin explain noise levels from bottling activities are expected to be an L50 of 53 dBA at the property line of Residence 4 located at 7181 Westside Road. Based on the findings shown, noise associated with bottling noise is expected to exceed daytime or nighttime NE-2 noise standard at the property line of Residence 4 and mitigation is needed.

***Mitigation for Bottling Noise**: The incorporation of the 6 foot high sound barrier as discussed above will also be effective in reducing daytime or nighttime bottling noise levels to below the L50 NE-2 noise standards.*

The noise barrier/retaining wall will be located at the winery building site, located outside of the 200-foot Scenic Corridor setback along Westside Road and would be shielded from view from the public roadway by the existing residence, as well as existing and proposed landscaping located in the front portion of the of the project site. Also, the noise barrier/retaining wall will meet the side-yard setback of 10-feet from the southerly property line boundary.

Winery Forklift Operations:
Forklift and maintenance operations would take place on the first floor inside the winery building, in the outdoor crushing and receiving areas, and in the wine cave. Such activities within the winery building would also receive considerable shielding from the building. Outdoor forklift and maintenance operations are considered worst-case condition and have been analyzed. Forklifts are not necessary for the tasting rooms' operations.

Based on a review of the project drawings by the acoustical consultant, the closest to feet of the adjacent residences would be receiving area/truck access, which is 1,335 feet to Residence 1, within 1,595 to Residence 2, and within 1,515 feet of Residence 3. Noise from forklift and maintenance operations activities are expected to be an L_{08} of between 37 and 38 dBA at Residence 1 and L_{08} of between 36 and 37 dBA at Residences 2 and 3.

For Residence 4, in the August 2017 Addendum, Ilingworth and Rodkin explains noise levels from the outdoor forklift and maintenance operations in the truck loading area are considered a worst-case condition and have been analyzed. Based on a review of project drawings, the center of the closest truck loading outdoor area will be about 55 feet from the property line of Residence 4 located at 7181 Westside Road. Using the source levels discussed in the original Noise assessments, a 6 dB shielding factor for the retaining wall at the edge of the truck loading area and a 6 dB sound reduction for each doubling of the distance between the noise source and the receiver, noise from forklift and maintenance operations activities are expected to be an L08 of 60 dBA at the property line of Residence 4 and noise associated with forklift and maintenance operations is not expected to exceed daytime NE-2 noise standards at the property line of Residence 4 located at 7181 Westside.

Forklift and maintenance operations will only occur during daytime hours. Based on these findings, the noise assessment concludes that noise associated with forklift and maintenance operations is not expected to exceed daytime NE-2 noise standard at the nearest residences and no mitigation is needed.

Event Noise at Adjacent Residential Uses:
The winery proposes agricultural promotional events and participation in two industry-wide event

days. The request includes 22 agricultural promotional events per year with a range of maximum guests (10 events with 30 guests, 5 events with 60 guests, 5 events with 120 guests, & 2 events with 300 guests), and participation in industry wide events totaling two event days per year with a maximum of 300 guests For the largest events of 300 guests, a staff of 14 employees is anticipated.

Events will be held on the east side of Westside Road in the tasting rooms or at the Picnic Grove area located along the eastern boundary of the property. The production facility on the west side of the roadway will only be open to guests by invitation only. Events occurring within the winery buildings would receive noise shielding from the building structures estimated at 12 dBA (assuming open windows and doors). However, the outdoor events held in the garden area or yard between the tasting room/barn and Westside Road, in the yard south of the barn, or in the picnic grove area would receive little or no noise attenuation from intervening terrain or building structures at Residence 1, 2 and 3. The outdoor area between the public and private tasting room buildings would have some shielding from the private tasting room.

The noise assessment notes that if outdoor events would take place around the two tasting rooms they would be situated as close as 690 feet from Residence 1, 1,775 feet from Residence 2, and 1,900 feet from Residence 3. The indoor events at these locations would be located, from property lines, 885 feet from Residence 1, 1,100 feet from Residence 2, 1,110 feet from Residence 3, and over 1000 feet from Residence 4. It was concluded that all daytime and nighttime outdoor events would exceed County NE-2 standards at Residence 1, 2 and 3 in the amplified music and speech categories, except amplified speech during daytime hours at Residence 3. Additionally, non-amplified music NE-2 standards would also be exceeded at nighttime at Residence 1 and 2. The assessment further found that the only County NE-2 standard that would be exceeded during an outdoor event in the Picnic Grove area, as measured at Residence 2, would be amplified music in the nighttime. It was noted that the standards was exceeded by only 1 dBA. It was also found that daytime or nighttime <u>indoor</u> events with amplified music, amplified speech, non-amplified music, films, or raised conversations would not exceed the County NE-2 standards at any of the three adjacent residences.

For Residence 4, in the August 2017 Addendum, Ilingworth and Rodkin explain that indoor agricultural promotional events held in the tasting rooms would exceed the daytime and nighttime NE-2 standards at property line of Residence 4 by 26 dBA and normal amplified music, amplified speech and non-amplified music would exceed the County daytime NE-2 standards by 2 to 7 dBA at property line of Residence 4. Mitigation measure has been incorporated into the project to require that doors and windows be closed during agricultural promotional events when amplified music and/or sound is being used.

In the August 2017 Addendum, Ilingworth and Rodkin explain, based on a review of aerial photos and the project site plan, outdoor events that take place in the picnic grove would be over 1000 feet from the property line of Residence 4. Outdoor event noise is not expected to exceed daytime NE-2 noise standards at the property line of Residence 4 located at 7181 Westside.

The event space in the private tasting room (hop bale barn) and the guest rooms are the closest indoor venues for events to Residence 4 being as close as 125 feet from the property line of Residence 4. Using these distances and the noise shielding considerations for outdoor and indoor events, the L50 sound levels for the typical noise source levels listed in Table 4 of the ENA (and the County requested peak L50 level for musical instruments of 88 dBA at 40 feet) for outdoor and indoor events have been calculated at the property line of Residence 4.

For Residence 4, in the August 2017 Addendum, Table 8 summarizes the assessments for outdoor special events noise in the picnic grove area. Since amplified music and speech are not proposed at these outdoor events, they are not shown in these tables. In the August 2017 Addendum Table 9 summarizes the assessment for the indoor special event noise. Since special events would not occur during nighttime hours (see Table 1 of the ENA), the County’s nighttime limits shown in Table NE-2 would not be applicable to the proposed project and are not shown in Tables 8 or 9. Based on these findings shown in Table 8, outdoor event noise is not expected to exceed daytime NE-2 noise standards at the property line of Residence 4 located at 7181 Westside.

Conclusion:

Illingworth and Rodkin conclude based on the findings shown in Table 15, indoor events with amplified music would exceed the County daytime and nighttime NE-2 standards at all of the three adjacent residences by between 1 to 2 dBA during daytime hours. However, the findings shown in Table 15 indicate that indoor events with amplified speech, non-amplified music, films, or raised conversations would not exceed the County daytime NE-2 standards at Residences 1, 2, and 3.

Consistent with County Standards, the above findings for outdoor events and indoor events show that amplified music at events within buildings with open windows would exceed the daytime County NE-2 standard at Residences 1, 2 and 3. However, with closed windows all indoor events, with the exception of those with peak amplified music, would meet the County daytime NE-2 standards at the property line of Residence 4. Illingworth and Rodkin recommends the following mitigations since there is the potential for noise levels to exceed the standards:

1. Amplified music at events should only occur within the baling barn or tasting room buildings with closed windows and doors.

2. With closed windows and doors, indoor events with amplified speech or music may occur during daytime hours.

3. Amplified music within the baling barn or tasting room buildings should be maintained at normal, not peak amplification levels, such that the L50 level of the amplified music not exceed 72 dBA at a distance of 50 feet.

In addition, during the project construction, there will be temporary increases in the areas ambient noise levels. Temporary increase in noise levels from equipment operation that could exceed County standards are expected to occur during construction. This would be a short-term, temporary impact that will cease when construction is complete.

With the implementation of the mitigation measures to reduce overall noise levels generated by the winery and tasting rooms during construction activities, during winery production activities, during agricultural promotional events and industry-wide events; the noise levels at the property lines of the four sensitive receptors would be maintained at or below the County NE-2 standards to a level of less than significant.

Mitigation Measure 12 a.1:

Based on the Noise Element of the General Plan, the Environmental Noise Assessment prepared by Illingworth and Rodkin, dated March 7, 2017, and the Addendum dated August 16, 2017; and the current Site Plan; the following operational noise limitations apply to each of the buildings or site features on the project site:

1. At the **Winery building** (*west side* of Westside Rd):

- The use of amplified music or sound systems is not permitted either indoors or outdoors. This does not restrict the use of small personal music devices or personal computer music devices used by employees of the winery.
- Acoustical music is not permitted either indoors or outdoors.

2. At the **two tasting room buildings** (*east side* of Westside Rd):
    - The use of amplified music and sound is permitted indoors during daytime hours with doors and windows closed.
    - The use of amplified music and sound is permitted up to 9 P.M. with doors and windows closed.
    - The use of loud instruments (drums, cymbals, horns, and similar instruments) and acoustical music is permitted indoors with doors and windows closed.
    - Amplified music within the baling barn or tasting room buildings shall be maintained at normal, not peak amplification levels, such that the L50 level of the amplified music not exceed 72 dBA at a distance of 50 feet.
    - The use of outdoor music or sound systems is not permitted around the tasting room buildings.

3. At **Picnic Walnut Grove** (*east side* of Westside Rd):
    - The use of outdoor amplified music or sound systems is not permitted in this area.
    - The use of loud instruments (drums, cymbals, horns, and similar instruments) is not permitted in this area.
    - The use of outdoor amplified speech is permitted, but limited to using a sound system mechanically set to limit the volume level to 78 dBA at 50 feet.
    - The use of quieter, **non-amplified,** acoustic musical instruments (such as piano, stringed instruments, woodwinds, flute, etc.) not exceeding the level of ordinary conversations, is permitted outdoors in the Picnic Walnut Grove, during daytime hours, when in compliance with the *Adjusted* Noise Element of the Sonoma County General Plan. Agricultural promotional events shall cease by 9 P.M.

4. Outdoor event activities, including outdoor wine tasting, are only permitted at the Picnic Walnut Grove area, as depicted on the approved Site Plan.

Mitigation Monitoring 12.a.1: If noise complaints are received from nearby residents, and they appear to be valid complaints in PRMD's opinion, then the applicant shall conduct a Noise Study to determine if the current operations meet noise standards and identify any additional noise Mitigation Measures if necessary. A copy of the Noise Study shall be submitted to the Project Review Health Specialist within sixty days of notification from PRMD that a noise complaint has been received. The owner/operator shall implement any additional Mitigation Measures needed to meet noise standards.

Mitigation Measure 12.a 2: Agricultural promotional events shall consist of wine marketing events, wine pairing meals or events promoting a specific aspect of Sonoma County agriculture. Weddings, concerts, dances or personal/business parties are not permitted under this Use Permit.

Mitigation Monitoring 12.a.2: If noise complaints are received from nearby residents, and they appear to be valid complaints in PRMD's opinion, then the applicant shall conduct a Noise Study to determine if the current operations meet noise standards and identify any additional noise Mitigation Measures if necessary. A copy of the Noise Study shall be submitted to the Project Review Health Specialist within sixty days of notification from PRMD that a noise complaint has been received. The owner/operator shall implement any additional Mitigation Measures needed to meet noise standards.

Mitigation Measure 12.a 3: NOTE ON GRADING, IMPROVEMENT, AND BUILDING PLANS:

Construction activities associated with this project shall be restricted as follows:

a. All internal combustion engines used during construction of this project will be operated with mufflers that meet the requirements of the State Resources Code, and, where applicable, the Vehicle Code. Equipment shall be properly maintained and turned off when not in use.
b. Except for actions taken to prevent an emergency, or to deal with an existing emergency, all construction activities shall be restricted to the hours of 7:00 a.m. and 7:00 p.m. on weekdays and 9:00 a.m. and 7:00 p.m. on weekends and holidays. If work outside the times specified above becomes necessary, the applicant shall notify the PRMD Project Review Division as soon as practical.
c. There will be no starting up of machines nor equipment prior to 7:00 a.m, Monday through Friday or 9:00 am on weekends and holidays; no delivery of materials or equipment prior to 7:00 a.m nor past 7:00 p.m, Monday through Friday or prior to 9:00 a.m. nor past 7:00 p.m. on weekends and holidays and no servicing of equipment past 7:00 p.m., Monday through Friday, or weekends and holidays. A sign(s) shall be posted on the site regarding the allowable hours of construction, and including the developer’s phone number for public contact.
d. Pile driving activities shall be limited to 7:30 a.m. to 7:00 p.m. weekdays only.
e. Construction maintenance, storage and staging areas for construction equipment shall avoid proximity to residential areas to the maximum extent practicable. Stationary construction equipment, such as compressors, mixers, etc., shall be placed away from residential areas and/or provided with acoustical shielding. Quiet construction equipment shall be used when possible.
f. The Permit Holder shall designate a Project Manager with authority to implement the mitigation prior to issuance of each building/grading permit. The Project Manager’s phone number shall be conspicuously posted at the construction site. The Project Manager shall determine the cause of noise complaints (e.g. starting too early, faulty muffler, etc.) and shall take prompt action to correct the problem.

Mitigation Monitoring 12.a.3: PRMD staff shall ensure that the note listed above has been placed on all grading, building, and improvement plans prior to issuance of permits. Any noise complaints will be investigated by PRMD staff. If violations are found, PRMD shall seek voluntary compliance from the permit holder and thereafter may initiate an enforcement action and/or revocation or modification proceedings, as appropriate. (Ongoing)

Mitigation Measure 12.a 4: Prior to issuance of temporary or final occupancy of the winery building, or vesting the Use Permit, to reduce noise levels from heavy trucks using the truck loading and turn around area, and from bottling noise, the height of the retaining wall on the south side of the loading area shall be extended to 6- feet above existing grade (above the retaining wall as depicted on project plans) and shall consist of masonry materials to act as a noise barrier. This noise barrier/retaining wall with a height of 6-feet above the existing ground level shall extend for 100-feet parallel to the southerly property line boundary of the winery site. The barrier height in relation to building pad elevation must be certified by the project engineer. The sound consultant shall confirm in writing that the design, location, and final construction of the noise barrier/retaining wall complies with the required noise standards as described in the Noise Study Addendum, prepared by Illingworth and Rodkin, dated August 16, 2017. (Refer to Sheets A0.00, A1.02, and A2.04 of the Project Plans, dated August 16, 2017).

Mitigation Monitoring 12.a.4: Prior to temporary or final occupancy of the winery building or vesting of the Use Permit, a letter from the sound consultant shall be submitted to the Project Review Health Specialist confirming the noise barrier/retaining wall consisting of masonry materials has been located, designed, and constructed in accordance with the recommendations as described in the Noise Study Addendum, prepared by Illingworth and Rodkin, dated August 16, 2017.

Mitigation Measure 12.a 5: The southern façade and part of the eastern façade of the Mechanical Equipment Room of the winery building shall be designed and constructed as solid walls with any and all materials recommended by the sound consultant to ensure a 28+ dBA reduction and meet 42dBA nighttime standard per adjusted Table NE-2 (Refer to Sheet A1.12 of the Project Plans, dated August 16, 2017).

Mitigation Monitoring 12.a.5: Prior to issuance of any building permit for the winery building, project plans shall depict the southern façade and part of the eastern façade of the Mechanical Equipment Room of the winery building shall be installed with solid walls. Prior to temporary of final occupancy of the winery building, a letter from the sound consultant shall be submitted to the Project Planner confirming the solid walls have been constructed in accordance with the recommendations as described in the Noise Study Addendum dated August 16, 2017.

Mitigation Measure 12.a 6: No nighttime heavy truck deliveries and/or shipments is permitted, and no nighttime bottling is permitted between the hours of 10 P.M. and 7 A.M.)

Mitigation Monitoring 12.a.6: Any noise complaints will be investigated by PRMD staff. If violations are found, PRMD shall seek voluntary compliance from the permit holder and thereafter may initiate an enforcement action and/or revocation or modification proceedings, as appropriate. (Ongoing

b) Exposure of persons to or generation of excessive ground borne vibration or ground borne noise levels?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
		X		

Comment:
12.b. Less than Significant Impact with Mitigation Incorporated. The project includes one-time construction activities that may generate ground borne vibration and noise. These levels would not be significant because they would be short-term and temporary, and would be limited to daytime hours. There are no other activities or uses associated with the project that would expose persons to or generate excessive ground borne vibration or ground borne noise levels.

Mitigation: Refer to mitigation above in item 12.a.

c) A substantial permanent increase in ambient noise levels in the	Potentially Significant Impact	Less than Significant with Mitigation	Less than Significant Impact	No impact

project vicinity above levels existing without the project?		Incorporation		
		X		

<u>Comment:</u>
12.c. Less than Significant Impact with Mitigation Incorporated. (**See discussion and mitigation measures above under Item 12(a).**

Mitigation: Refer to mitigation above in item 12.a.

d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
		X		

<u>Comment:</u>
12.d. Less than Significant Impact with Mitigation Incorporated. (**See discussion and mitigation measures above under Item 12(a).** The County does not establish noise standards for construction in its General Plan or County Code. Construction of the project would generate noise and may temporarily increase noise levels at adjacent residential receivers. Noise impacts resulting from construction depend on the noise generated by various pieces of construction equipment operating on site, the timing and duration of noise generating activities, and the distance between construction noise sources and noise sensitive receptors. Construction of the project would involve site improvements, and to interior remodeling, building framing, and landscaping. Noise sensitive residential land uses are located nearly 950 feet from the proposed project site/winery/ tasting room. Mitigation measure have been incorporated into the project to reduce potential impacts to sensitive receptors to a level of less than significant impact.

Mitigation: Refer to mitigation above in item 12.a.

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
			X	

<u>Comment:</u>
12.e. Less than Significant Impact: The project is located 2.25 mile northwest of the Sonoma County/Charles Shultz Airport. As discussed above under Item 8e and 8(f), the proposed project has been reviewed with respect to airport compatibility criteria in the County’s 2016 Revised Comprehensive Airport Land Use Plan as well as the proposed amended criteria. Therefore, the project would have no impact. The parcel is outside of the areas that may experience airport noise in excess of 55 CNEL, so it is not considered noise impacted. The project does not involve

construction of any structure that may project into protected airspace, therefore no noise issues are anticipated and therefore this would be a less than significant impact.

Mitigation: None required

f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
			X	

Comment:
12.f. Less than Significant Impact: There are no known private airstrips within the project area. However, under item 12e above, the site is located approximately 2.25 miles northwest of the Sonoma County/Charles Shultz Airport. The parcel is outside of the areas that may experience airport noise in excess of 55 CNEL, so it is not considered noise impacted, therefore no noise issues are anticipated and therefore this would be a less than significant impact.

Mitigation: None required

13. POPULATION AND HOUSING- Would the project:

a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
				X

Comment:
13.a. No Impact: The project would not include construction of homes or infrastructure and therefore would not induce substantial population growth.

Mitigation: None required

b) Displace substantial numbers of existing housing necessitating the construction of replacement housing elsewhere?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
				X

Comment:
13.b. No Impact: The project would not displace a substantial number of existing housing units, or require replacement housing.

Mitigation: None required

c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
				X

Comment:
13.c. No Impact: No people will be displaced by the project.

Mitigation: None required

14. PUBLIC SERVICES - Would the project:

a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service rations, response times or other performance objectives for any of the public services:	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
				X

Comment:
14. a. No Impact: The project will not substantially increase the number of employees (with creation of 15 full-time, three part-time and six seasonal employees) such that governmental services and/or facilities will have to be expanded. Generally, any potential impact the project may have on the provision of public services and or expansion of governmental facilities will be offset by development fees. Specifically:

i. Fire Protection: The County Fire Marshal reviewed the project description and will require that the Project comply with Fire Safe Standards, including fire protection methods such as sprinklers in buildings, alarm systems, extinguishers, vegetation management, hazardous materials management and management of flammable or combustible liquids and gases.

ii. Police: The Sonoma County Sheriff provides police protection services. There will be no anticipated significant increased need for police protection resulting from the project.

iii. Schools, parks, or other public facilities: The project will not generate additional students; nor will it significantly increase demand for park or other public facilities.

iv. Parks: see above.

v. Other public facilities: no other public facilities would be adversely impacted by this project.

Mitigation: None required

15. RECREATION - Would the project:

a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
				X

Comment:
15.a. No Impact: The project would not cause nor accelerate substantial physical deterioration of parks or recreational facilities.

Mitigation: None required

b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
				X

Comment:
15.b No Impact. The project does not include recreational facilities.

Mitigation: None required

16. TRANSPORTATION / TRAFFIC *Would the project*:

a) Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
		X		

Comment:
16. a. Less than Significant with Mitigation Incorporated: The proposed project is located along Westside Road. The proposed project site includes winery and tasting room uses on both sides of Westside Road. The project site consists of one legal parcel bisected by Westside Road. A parcel bisected by a roadway does not create legal separate parcels. The Sonoma County General Plan

2020 Circulation and Transit Element Figure CT-4 identifies Westside Road as a Rural Major Collector.

The winery components (crushing, bottling, processing, aging, and storing of wine) will take place indoors in the new winery building and new wine cave located on the west side of the road, with access via an existing driveway that current serves the existing residence and accessory buildings. Parking for production employees, sales staff, and commercial visitors would be provided at the winery building. The tasting room and spaces for marketing events would be located on the east side of the road. Parking for tasting room employees and visitors as well as event guests would be provided on the same site (east of the road).

A focused Traffic Study was prepared for the project by Dalene J. Whitlock, PE, PTOE of Whitlock and Weinberger Transportation, Inc. (W-Trans) in 2014, revised February 23, 2015, and again revised for the Final Traffic Study dated March 10, 2016. The traffic study area consisted of the section of Westside Road providing access to the project site. Westside Road is a two-lane rural roadway with paved width of approximately 25 to 26 feet in the vicinity of the project site. It is marked with a double yellow centerline, and there is not a posted speed limit, though the curvilinear alignment keeps speeds lower than the prima facie 55 mph speed limit that would apply in the absence of a lower limit established by the County of Sonoma. A speed survey was performed at the driveway indicates that in the vicinity of the project site drivers are generally travelling about 30 to 35 mph.

The current volume on Westside Road is about 3,000 ADT near Felta Road based on counts performed by the County in August 2012, but drops to about 1,050 vehicles per day near the project site based on counts obtained on July 16, 2013. A count performed by the County in late July 2015 indicates the volumes have dropped 12 to 15 percent since 2012, though the higher 2012 volumes were used for this analysis.

Existing plus Project

Under Existing Plus Project volumes, W-trans explains the study roadway is expected to operate acceptably in both directions as shown in Table 5:

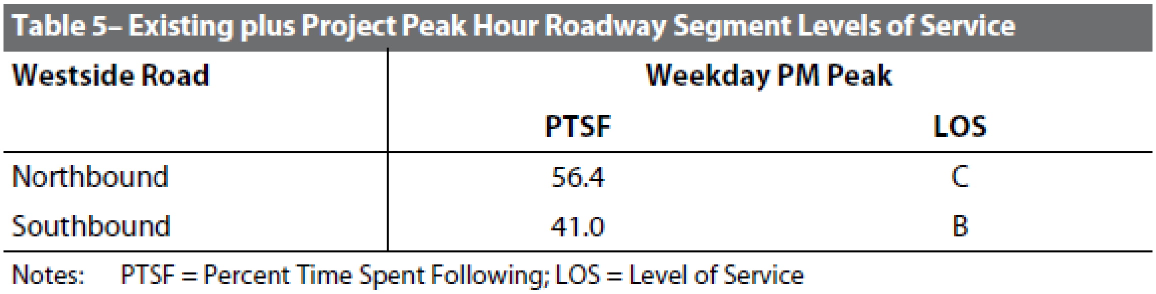

Table 5– Existing plus Project Peak Hour Roadway Segment Levels of Service

Westside Road	Weekday PM Peak	
	PTSF	LOS
Northbound	56.4	C
Southbound	41.0	B

Notes: PTSF = Percent Time Spent Following; LOS = Level of Service

Cumulative plus Project

With project traffic added to the anticipated Future volumes under the conservation assumption that all trips would come from the same direction, W-Trans explains the study roadways are expected to continue operating acceptably at the same levels of service as without the project, as summarized in Table 6:

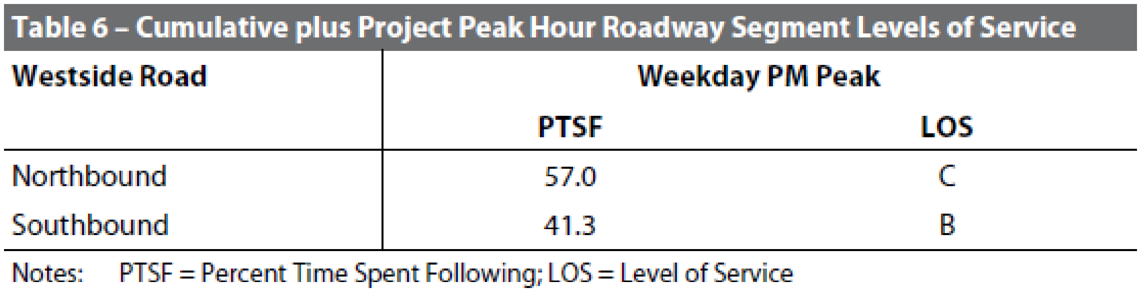

Table 6 – Cumulative plus Project Peak Hour Roadway Segment Levels of Service

Westside Road	Weekday PM Peak	
	PTSF	LOS
Northbound	57.0	C
Southbound	41.3	B

Notes: PTSF = Percent Time Spent Following; LOS = Level of Service

Collision History
On April 21, 2017, W-Trans provided an addendum letter to the Traffic Impact Study to provide collision history from January 1, 2012 through December 31, 2016. From 2012 to 2016, there were two collisions on the study segment during the most recent five-year period for which data is available from the California Highway Patrol, as published in their Statewide Integrated Traffic Records Systems (SWITRS). The segment of Westside Road within a half-mile of the project site had a calculated collision rate of 1.10 collisions per million vehicle miles (c/mvm). W-Trans compared this to the average collision rate for similar segments statewide, as indicated in the 2013 Collision Data on California State Highways, California Department of Transportation, which is 1.58 c/mvm. W-Trans concludes that since the collision rate was determined to be below average and there were only two crashes reported during this time period, the segment appears to be operating within expected safety parameters.

Trip Generation
Relative to trip generation, it is anticipated that the proposed new winery including tasting room would have a total of 15 employees, each generating an average of three trips per day. Truck traffic associated with winery operations is expected to consist of five trips per day, on average. An average of 52 visitors per day is expected for tasting, generating 42 trips daily assuming average vehicle occupancy of 2.5 visitors per vehicle the proposed project is expected to generate an average of 92 vehicle trips per day. The project also includes provisions for 24 events per year, including 10 events with 30 persons in attendance, five 60-person catered events, five 120-person events and four 300-person outdoor events, two of which would be industry wide. It is assumed that a maximum sized 300-person event would require a staff of 14. Using an occupancy of 2.5 vehicles per guests and solo occupancy for staff, maximum sized event would be expected to generate 268 trip ends at the driveway, including 134 inbound trips at the start of the event and 134 outbound trips at the driveway. Though these trips would be spread out such that no more than 60 trips in either direction would occur during a single hour, with staff arriving before and departing after guests. The distribution of trips for events is expected to be weighted more heavily to the south with 75 percent of the trips coming from/returning to this direction.

The traffic study noted that Westside Farms, the previous use of the site, held a harvest market each fall which included a pumpkin patch, hay rides and sales of hand crafted foods and gift items. This event which lasted for approximately the month of October each year, drew up to 600 persons on a peak day. This prior use generated substantially more event traffic during the month of October than the currently proposed project will generate over the course of an entire year.

Sensitive Analysis:
W-Trans explains that by using the same roadway segment Level of Service methodology in the Highway Capacity Manual it was determined that 208 vehicle trips could be added in each direction on Westside Road *before* the northbound direction would experience unacceptable LOS D operation.

Using the 2.5 guests per vehicle standard ratio, W-Trans estimated that vehicles carry more than 500 guests could arrive at agricultural promotional events during *one hour* and another set of 500 guests depart from the same or different winery event along the road, and the operation of Westside Road would remain acceptable under the standards established by the County.

W-Trans examined events sizes and even with the 300-person event proposed with this project, and assuming that as many as 150-guests arrive or depart during a single hour from the same direction, the road would retain capacity for other events having a combined total of more than 350 guests.

W-Trans explains it is reasonable to expect that up to 75 percent of event traffic (i.e. 225 guests) would come from the south. Assuming this is split, the largest event for the proposed project (i.e 300 guests maximum) would generate 75 guests from the north <u>or</u> 30 vehicles, leaving capacity for the cumulative demand associated with nearly 450 guests arriving and departing from other area wineries during the same, single hour.

With an emphasis that all these trips would need to occur during a *single hour* for the cumulative impact to be experienced, if the trips are spread over more than an hour's time, the cumulative effect is diluted. Based on their review, W-Trans concludes there is adequate capacity for the multiple events to generate trips simultaneously without having a significant negative impact on operation of Westside Road.

To avoid the potential for multiple large events occurring simultaneously, PRMD has encouraged wineries to coordinate event schedules amongst each other. The applicant is willing to do implement such coordination. For this project, a condition of approval requires the Permit Holder to coordinate with the two existing wineries (Williams-Selyem and Arista) closest to the project site.

Access and circulation were also evaluated and field conditions at the site driveway were field evaluated to determine adequacy of sight distance as well as to identify any potential for conflict between opposing driveways for the winery site and tasting room site. The tasting room driveway is on the easterly side of the roadway, opposite and offset from the winery driveway. The traffic study notes that conflicts with traffic to and from the opposing driveways are not expected.

Sight distances along Westside Road from the existing driveway locations were evaluated based on sight distance criteria. The prima facie speed is 55 mph, but based on a radar speed survey performed at the driveway, the curves at either side of the site effectively reduce speeds to an average of 30 mph. The minimum stopping sight distance needed for an approach speed of 35 mph is 250 feet. While existing sight lines to the south are adequate for the winery driveway on the westerly side of the Westside Road, the curve north of the driveway limits sight lines to less than 250 feet recommended. The applicant's engineer, Adobe & Associates, prepared a Stopping Sight Distance plan depicting the sight distance can be achieved to meet standards by trimming trees and shaving the northwest hillside. Adobe & Associates also prepared a video simulation showing vehicle travel with the sight distance improvements completed, stopping sight distance can be achieved.

Based on the project proposal it is anticipated that pedestrian trips between the winery and tasting room will be infrequent, and limited to employees. The operation as proposed is not expected to result in any need for guests to cross from one side of Westside Road to the other. Nonetheless, a gate is required to be installed in the winery's driveway to restrict the access to the general public.

The need for turn lanes on Westside road was also evaluated and traffic counts taken for both am and pm peak hours used for the evaluation did not warrant the need for a left turn pocket at the project site.

The traffic study concluded the following:

- Based on the review and analysis performed, it is anticipated that the proposed project will have a limited impact on traffic operation along Westside Road, and will actually generate fewer special event trips that the previous use for Westside Farms.

- Westside Road is expected to operate acceptably under volumes including project generated traffic and traffic associated with agricultural promotional events both in the short-term and long-range. Further, multiple events could occur simultaneously without triggering unacceptable operating conditions under the County's standards.

- Westside Road has experienced collisions at a rate below the statewide average, so exhibits an acceptable safety condition.

- Sight distance from the tasting room driveway on the east side of Westside Road is generally adequate, though existing "Westside Farms" sign should be removed and this area left clear to provide acceptable sight distance to the north.

- Sight distance to the north from the winery driveway on the west side of the road is adequate to the south, but inadequate to the north. The proposed measures, including removing and/or trimming vegetation together with terracing/lowering the hillside on the project site as necessary, should be implemented.

- Very little pedestrian traffic is expected between the winery and tasting room, and that will be limited to staff. However, should other pedestrian traffic be generated, sight lines will be adequate for such crossings upon implementation of the proposed measures noted above.

- A left turn lane is neither warranted nor recommended on Westside Road at the project's driveways.

The project site utilizes Westside Road as its primary means of vehicle access. Westside Road, which runs along the frontage of the project site, is generally oriented north-south and is classified a Rural Major Collector. At the project site, the roadway is a two-lane rural roadway with a paved width of 25 to 26 feet. The General Plan classifies Westside Road as a Class III bikeway. The Sonoma County Bicycle and Pedestrian Plan classifies Westside Road as a Class III bikeway. The Bicycle Advisory Committee also reviewed the proposal and their comments only pertained to conditioning the project to provide adequate bicycle racks near the entrance to the proposed public tasting rooms. Given the rural nature of the project setting, existing relatively low vehicle counts, additional traffic generated by the project is expected to be able to be accommodated by Westside Road. And with the low volumes of trip generation, the proposed project would not significantly impact or conflict with established plans and policies for streets, highways, and/or intersections. Sonoma County has established significance standards for both intersections (LOS D or better) and roadways (LOS C or better). With the proposed project traffic, all intersection/roadways would be expected to operate within County prescribed standards.

On-Site Parking
There will be 24 on-site parking spaces (20 standard and 4 ADA parking spaces) on a chip sealed surface, as well as 24 overflow (standard) spaces for the tasting facility located on the east side of the property. The parking area would be accessed by an 18-foot wide gravel driveway. The parking area is to be landscaped providing a separation between the primary parking field and the overflow parking. The entrance to the property is to be improved with an all surfaced driveway that would transition to chip seal base for the primary parking area, gravel for the overflow parking and for the vineyard access road. T

The winery located on the west side of Westside Road would be developed with an asphalt base and a total of 48 parking spaces would be provided, which include 27 permanent and 21 seasonal overflow parking spaces.

The Department of Public Works and Transportation reviewed and accepted the 2016 Traffic analysis prepared by W-Trans. DTPW had several conditions for the project and recommends the Applicant update the project overflow parking plan to account for previously identified overflow spaces that are eliminated from the production facility parking lot. To ensure adequate on-site parking, traffic control, and road safety is implemented and developed in conformance with the Use Permit, the following mitigation measures have been incorporated into the project:

Mitigation Measure 16.a. 1: Under the approval of an Encroachment permit and prior to issuance of any building permits for the winery building by PRMD, modifications to the embankment and vegetation on the Permit Holder's property on the northerly side of the project's west side driveway entrance shall be completed to allow a minimum of 250-feet of sight distance needed for the critical approach speed. The plans for the modification to the embankment shall be prepared by a Registered Civil Engineer and shown on the final grading plans for the project. The details of vegetation removal shall be done by a licensed landscape architect and depicted on the final landscape plans. This area shall be maintained with hardscape materials or low lying ground vegetation.

Mitigation Monitoring 16.a.1: The Permit and Resource Management Department shall not issue any grading permit or building permit until the Encroachment permit has been approved to allow the modifications to the embankment and vegetation on the Permit Holder's property on the northerly side of the project's west side driveway entrance.

Mitigation Measure 16.a. 2: The existing Westside Farms sign shall be removed and this area left clear to provide adequate sight distance to the north.

Mitigation Monitoring 16.a.2: The Permit and Resource Management Department shall not issue any grading permit until the Westside Farms sign has been removed.

Mitigation Measure 16.a. 3: Prior to PRMD issuance of temporary or final occupancy on building permits for the winery or tasting room buildings, the Permit Holder shall obtain necessary permits to install an automated swing or rolling gate at the winery production facility (west) project driveway. Fire and emergency access shall be provided per Fire requirements. The gate shall be setback a minimum distance of 30 feet from the edge of pavement. NOTE: Placement of temporary barricades in this driveway during events does not satisfy this requirement. In addition, to minimize pedestrian crossings at Westside Road, the winery production facility (west) parking lot shall remain closed to the general public. All guest parking shall be provided on the tasting room side (east) of the public road.

Mitigation Monitoring 16.a. 3: PRMD shall not issue final or temporary occupancy on the winery or tasting room buildings, until the Permit Holder has obtained all necessary permits and has installed the automated swing or rolling gate at the winery production facility (west) project driveway. Fire and emergency access shall be provided per Fire requirements. The gate shall be setback a minimum distance of 30 feet from the edge of pavement.

Mitigation Measure 16.a.4: Agricultural promotional events on the west side of the project site are limited to a maximum capacity of 30 guests. No industry-wide events shall be held on the west side of the project site.

Mitigation Monitoring 16.a. 4: Failure by the Permit Holder to adhere to the 30-guest maximum on the west side of the project site or holding industry-wide events on the west side of the project site is considered a violation of the Use Permit conditions and subject to modification or revocation proceedings.

Mitigation Measure 16.a.5: To minimize pedestrian crossings at Westside Road, the winery production facility (west) parking lot shall remain closed to the general public. All guest parking shall be provided on the tasting room side (east) of the public road. (On-going Condition).

Mitigation Monitoring 16.a. 5: Failure by the Permit Holder to keep the automated gate closed to the general public is considered a violation of the Use Permit conditions and subject to modification or revocation proceedings. (On-going Condition).

Mitigation Measures 16.a. 6: Prior to final or temporary occupancy on the winery or tasting room buildings, the Permit Holder shall submit for approval to the Project Planner at PRMD a Traffic and Parking Management Plan prepared by a qualified traffic engineer. In order to provide orderly and efficient movement of vehicles entering the site and to minimize traffic impacts on the public road the Traffic and Parking Management Plan shall include; but not limited to, on-site traffic control measures for all events that exceed 100 guests or more. Traffic control shall be located off of the public road.

Mitigation Monitoring 16.a.6: The Permit and Resource Management Department shall not issue temporary or final occupancy on any building permit for the winery or tasting room buildings until the any grading permit until a Traffic and Parking Management Plan has been submitted and approved by the Project Planner at PRMD.

Mitigation Measure 16.a. 7: The Permit-Holder prior to scheduling any large agricultural promotional events of 100 guests or more on the project site shall coordinate events with the two adjacent winery operators within one-half mile to off-set event days and/or event times. The Permit-Holder shall notify PRMD Planner in writing that coordination with other winery operators in the area has been done prior to larger agricultural events occurring on the project site. On-going

Mitigation Monitoring 16.a. 7: Failure by the Permit Holder to coordinate the larger agricultural promotional events of 100 guests or more on the project site events with the two adjacent winery operators within one-half mile shall be considered a violation of the Use Permit conditions and subject to modification or revocation proceedings.

	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
b) Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?			X	

<u>Comment:</u>
16. b. Less than Significant Impact. The proposed project would not significantly impact adjacent intersections, roadways, or highways, given the relatively low number of daily vehicle trips (92) it would generate. The traffic study concluded that the Westside Farms, the previous use of the site generated substantially more event traffic during the month of October than the currently proposed project will generate over the course of an entire year. Sonoma County has established significance standards for both intersections (LOS D or better) and roadways (LOS C or better). With proposed project traffic, all intersection/roadways would be expected to operate within County prescribed standards.

Mitigation: None required

c) Result in change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
				X

Comment:
16. c. No Impact. The project would have no effect on air traffic patterns.

Mitigation: None required

d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
		X		

Comment:
16. d. Less than Significant Impact with Mitigation Incorporated (Refer to discussion and mitigation in item 16.a. above in this initial study checklist): A focused Traffic Study was prepared for the project by Dalene J. Whitlock, PE, PTOE of Whitlock and Weinberger Transportation, Inc. (W-Trans). The traffic study area consisted of the section of Westside Road providing access to the project site. Westside Road is a two-lane rural roadway with paved width of approximately 25 to 26 feet in the vicinity of the project site. It is marked with a double yellow centerline, and there is not a posted speed limit, though the curvilinear alignment keeps speeds lower than the prima facie 55 mph speed limit that would apply in the absence of a lower limit established by the County of Sonoma. A speed survey was performed at the driveway indicates that in the vicinity of the project site drivers are generally travelling about 30 to 35 mph.

Sight distances along Westside Road from the existing driveway locations were evaluated based on sight distance criteria. The prima facie speed is 55 mph, but based on a radar speed survey performed at the driveway, the curves at either side of the site effectively reduce speeds to an average of 30 mph. The minimum stopping sight distance needed for an approach speed of 35 mph is 250 feet. While existing sight lines to the south are adequate for the winery driveway on the westerly side of the Westside Road, the curve north of the driveway limits sight lines to less than 250 feet recommended. However, measures are to be taken to remove and/or trim vegetation and shave back the hillside as necessary to achieve the 250 feet of sight distance needed for critical approach speed.

It is noted in the traffic study that there is a mirror on the east side of the road that provides adequate visibility of oncoming traffic to drivers exiting the driveway. Mirrors are not typically recommended along public roadways, in part because the mirror would either need to be in the public right-of-way or on another person’s property. In this case, the property on both sides of the road belongs to the same owner, so the mirror can be maintained on private property and outside the public right-of-way. Because the mirror may further extend sight lines beyond the minimum needed, it is suggested that the mirror be retained so that the infrequent vehicle travelling at higher speeds can be seen approaching from an adequate distance.

Case good storage will done off site. Cases of wine to serve the daily needs of the tasting rooms would be delivered from the off-site warehouse to the tasting rooms. This would be done by a standard delivery truck. The traffic study concluded the following:

- Based on the review and analysis performed, it is anticipated that the proposed project will have a limited impact on traffic operation along Westside Road, and will actually generate fewer special event trips that the previous use for Westside Farms.

- Westside Road has experienced collisions at a rate below the statewide average, so exhibits an acceptable safety condition.
- Sight distance from the tasting room driveway on the east side of Westside Road is generally adequate, though existing "Westside Farms" sign should be removed and this area left clear to provide acceptable sight distance to the north.
- Sight distance to the north from the winery driveway on the west side of the road is adequate to the south, but inadequate to the north. The proposed measures, including removing and/or trimming vegetation together with shaving back the hillside as necessary, should be implemented.
- Very little pedestrian traffic is expected between the winery and tasting room, and that will be limited to staff. However, should other pedestrian traffic be generated, sight lines will be adequate for such crossings upon implementation of the proposed measures above.
- A left turn lane is neither warranted nor recommended on Westside Road at the project's driveways.

Mitigation: Refer to mitigations listed above in item 16.a.

e) Result in inadequate emergency access?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
		X	X	

Comment:

16. e. Less than Significant Impact with Mitigation Incorporated. (Refer to discussion and mitigation measures under item 16 a above in this initial study checklist). The existing main driveway from Westside Road on the east side of the project site provides proposed on-site circulation areas for the new tasting facility and parking areas, and would meet the Sonoma County Fire Marshall's requirements for access to the site and structures for fire protection. However, sight distance to the north from the winery driveway on the west side of the road is adequate to the south, but inadequate to the north. The proposed measures, including removing and/or trimming vegetation together with shaving back the hillside as necessary, should be implemented

Mitigation: Refer to mitigation above in item 16.a.

f) Result in inadequate parking capacity?

Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
	X		

Comment:

16.f Less Than Significant with Mitigation Incorporated: The project site and Site Plan demonstrates there is adequate room for all on-site parking needs. Nonetheless, mitigation measures have been incorporated into the project to ensure adequate parking on the site for all guest and employee vehicles, as follows:

Mitigation Measure 16.f. (1): Parking of vehicles and/or trucks associated with this winery facility is not permitted along any public or private roadways, or shared vineyard roads.

Mitigation Monitoring 16.f (1): If the Permit and Resource Management Department receives complaints that vehicles and/or trucks associated with this winery facility are being parked along public roadways, PRMD staff would investigate the complaint and if the condition is violated the use permit may be subject to modification.

Mitigation Measure 16.f. (2): For the larger industry-wide events and agricultural promotional events of 125 guests or more, at least two parking attendants shall be on duty to direct and guide the on-site parking of guest vehicles. Parking attendants shall remain on duty throughout the duration of the events.

Mitigation Monitoring 16.f (2): If the Permit and Resource Management Department receives complaints that parking attendants are not on duty during the larger industry-wide events and agricultural promotional events, PRMD staff would investigate the complaint and if the condition is violated the use permit may be subject to modification.

	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
g) Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?				X

Comment:
16.g Less than Significant Impact. The 2010 Sonoma County Bicycle and Pedestrian plan encourages new developments to incorporate bicycle friendly design. In the County's Plan, Westside Road is designated as a Class I bike route. Some visitors may utilize bicycles to access the proposed project site. The project will not create conflicts with County bicycle standards or plans for use alternative transportation, including bus turnouts. The project was reviewed by the Sonoma County Bicycle Coalition and the following condition has been required for the winery development:

Prior to final or temporary occupancy of the winery building, bicycle racks shall be installed near the parking lot (refer to the Sonoma County Parking Regulations –Zoning Code Sec. 26-86-010). One bicycle parking space be provided for every 5 spaces required for automobiles. Please use Bicycle Parking Guidelines by the Association of Pedestrian and Bicycle Professionals (http://drusilla.hsrc.unc.edu/cms/downloads/BikePark_Guidelines.pdf).

Bicycle racks will be required to be located at the winery site; County bicycle parking standards of 1 space per 5 required vehicle parking spaces will be enforced as part of plan check review.

Mitigation: None required

17. UTILITIES AND SERVICE SYSTEMS - Would the project:

	Potentially Significant Impact	Less than Significant with Mitigation	Less than Significant Impact	No impact
a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?				

		Incorporation		
			X	

Comment:
17.a. Less than Significant Impact: The project includes industrial and domestic wastewater systems. The size and design of the wastewater system must be approved by the Well and Septic Section of PRMD, and by the North Coast Regional Water Quality Control Board (NCRWQCB) through the Waste Discharge Requirement permitting process. These permits will be analyzed to ensure that wastewater treatment requirements will not be exceeded. See question 17(b) for additional information.

Mitigation: None required

b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
			X	

Comment:
17.b. Less than Significant Impact: The Division of Environmental Health has reviewed the proposal and has stated that prior to building permit issuance the applicant shall obtain a permit for the sewage disposal system. It is noted that wet weather groundwater testing may be required and that the sewage disposal system is to meet peak flow discharge of the wastewater from all sources granted in the use permit and any additional sources from the parcel plumbed into the disposal system, and shall include the required reserve area. The proposed project will include the removal of the existing septic system and the construction of a new system that will be designed to accommodate 100 % of the wastewater flow from an event with 60 guests, in addition to peak wastewater flows from all other sources plumbed to the septic system, including 15 full time employees. Additionally, toilet facilities shall be provided for patrons and employees prior to vesting the use permit. Copies of floor plans shall be submitted to Environmental Health for review and approval prior to issuance of building permits.

Environmental Health has also noted that prior to issuance of building permits, the proposed sewage disposal system shall be evaluated relative to the proposed wine cave(s). It is further noted that if the floor of the wine caves are lower than any wastewater disposal field or septic tanks, a minimum 50-foot setback from any tanks, sumps and septic disposal field shall be maintained.

Discharge of wastewater is regulated by the Porter-Cologne Water Quality Control Act, California Water Code, California Code of Regulations and Chapters 7 and 24 of the Sonoma County Code. The project will be required to obtain a permit from PRMD and Waste Discharge Requirements (WDRs) from the NCRWQCB. A copy of the WDRs will be submitted to the Project Review Health Specialist prior to issuance of a Certificate of Occupancy or project operation and vesting the Use Permit.

All WDRs issued by the NCRWQCB include self-monitoring programs requiring the waste discharger to collect pertinent water quality data and to submit it to the NCRWQCB for evaluation of compliance with waste discharge requirements. In addition, NCRWQCB staff conducts periodic inspections of each regulated discharge to monitor compliance with waste discharge requirements. The NCRWQCB may take enforcement action in response to significant or chronic waste discharge requirement violations under the authority of the Porter-Cologne Water Quality Control Act (California Water Code).

Compliance with the Sonoma County Code, permit conditions, and WDRs will ensure that the project's wastewater disposal system will not cause significant environmental effects to water quality.

Relative to domestic water supply, the State Water Resources Control Board has reviewed the proposal as part of an application for a water system. The proposal will provide public and private tasting room to be located in the bottom floor of the existing barn. The tasting rooms will be open seven days a week from 10 a.m. to 5 p.m. The proposed project is to be a public water system and is required to obtain a water supply permit from the Division of Drinking Water of the State Water Resources Control Board prior to serving the water to the public for domestic purposes that include drinking and cooking. The system must demonstrate that the well is constructed in compliance with current California Department of Water Resources well standards which include a minimum of a 50-foot annular seal. The water system infrastructure must comply with applicable drinking water standards.

Compliance with the Sonoma County Code, permit conditions, and California Plumbing Code will ensure that the project's domestic water system will be incompliance with all applicable State and County regulations for the proposed water system.

Mitigation: None required

c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
			X	

Comment:
17.c. Less than Significant Impact. Storm water drainage facility requirements are described in items 9(d) and 9(e) above. A Preliminary Storm Water Mitigation Plan has been prepared for the project (Adobe Associates, Inc., December 20, 2013), which identifies proposed drainage features including landscape and planting areas, inlets, the existing on-site pond and vegetated buffers. These features are located on-site, small in scale and included in the project footprint, adjacent to the existing barns and proposed winery/wine cave facilities. The location of these features were included in the study area for the habitat assessment (Wildlife Research Associates & jane Valerius Environmental Consulting, June 2104), and cultural resources surveys (William Roop, Archaeological Resource Service, April 2014), and will not result in significant environmental effects on biological resources or cultural resources. Drainage improvements will maintain off-site natural drainage patterns and limit post-development storm water levels and pollutant discharges in compliance with the requirements described above in items 9(d) and 9(e), which ensure that the project will not result in significant impacts to water quality or off-site aquatic resources.

Mitigation: None required

d) Have sufficient water supplies	Potentially	Less than	Less than	No

available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?	Significant Impact	Significant with Mitigation Incorporation	Significant Impact	impact
			X	

Comment:
17.d. Less than Significant Impact. (Refer to discussion under Hydrology and Water Quality, Question 9(b) of this checklist). The project site is not in an area served by a public water system or community water system. The project site is served by private, on-site wells. On January 5, 2017, a Geologic Report (Report) was prepared for the project by EBA Engineering. The Report explains the property is currently equipped with five water supply wells located along the eastern margin of the property (see Figure 2). These wells are identified herein as Wells #1 through #5 and are used to provide water for the on-site operations, and to two neighboring property owners to the west. EBA concludes that the water supply characteristics of the underlying aquifer utilized by Wells #1 and #3 are more than adequate to accommodate the water demands associated with the proposed improvements and will not result in negative impacts to local groundwater or surface water resources.

Additionally, prior to the issuance of building permits the applicant is to provide an engineered design of the water supply system, construct and/or develop the water sources (wells and/or springs), complete the appropriate water quality testing and apply for a water supply permit from the State Drinking Water Program because it has been determined that more than 25 persons per day for 60 days within a year will be served by the water system. This will be a requirement prior to issuance of building permits for the proposed project. It has been demonstrated that the site has sufficient water supply to serve the project.

Mitigation: None required

e) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
			X	

Comment:
17.e Less than Significant Impact. Private, on-site wastewater disposal systems would be utilized for the project. Wastewater from the project is to be treated in a septic system that shall be designed by a registered civil engineer or registered Environmental Health Specialist and both soil analysis, percolation and wet weather testing as required. The proposed sewage system is to meet peak flow discharge of wastewater from all sources granted in the Use Permit and any additional sources from the parcel plumbed to the disposal system, and shall include a reserve area. According to the Division of Environmental Health, if the project is approved for agricultural promotional events, the applicant shall provide septic system capacity in accordance with PRMD Policy 9-2-31. The project septic system must be designed to accommodate 100% percent of the wastewater flow from an event with 60 guests, in addition to peak wastewater flows from all other sources plumbed to the septic system, including 15 employees.

Mitigation: None required

f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
				X
Comment: **17.f. No Impact** Sonoma County has access to adequate permitted landfill capacity to serve the proposed project.				
Mitigation: None required				
g) Comply with federal, state, and local statutes and regulations related to solid waste?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
				X
Comment: **17.g. No Impact.** Sonoma County has a solid waste management program in place that provides solid waste collection and disposal services for the entire County. The program can accommodate the permitted collection and disposal of the waste that will result from the proposed project.				
Mitigation: None required				

18. MANDATORY FINDINGS OF SIGNIFICANCE

a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
		X		
Comment: **18.a. No** As demonstrated by this environmental checklist, the project will not have any direct or indirect adverse effects that would have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to				

drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory. The proposed project will not result in degradation to the quality of the environment or otherwise create a significant impact upon wildlife habitat or species, including species of special concern. No special status plant species are known to be on or by the project site. No impacts to wetlands habitat would occur since there are no wetlands or riparian habitat areas on the project site in the area of the proposed development. The project also includes mitigation measures designed to limit site grading and other actions that may result in erosion or other actions that could ultimately affect off-site waterways and sensitive habitats. The applicant shall implement the following Best Management Practices. The project site would not create an impact to cultural or archaeological resources, or tribal cultural resources and no such resources were found in the project area, however, as a standard accidental discovery mitigation measure has been added as a precaution.

	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?		X		

Comment:

18.b. No

The project would develop a type of agricultural use on the property that is consistent with the 2020 General Plan and was considered by the 2020 General Plan EIR. Cumulative projects include development of residential, agricultural, and winery uses in the project area. As noted in this Initial Study, this project will not result in significant adverse impacts related to traffic congestion, safety or noise with mitigations incorporated into the project. The project will not make a considerable contribution to any other significant cumulative impacts.

The project has the potential to result in individually limited but cumulatively considerable impacts with respect to noise. However, project mitigation measures incorporated into the project will reduce the potential for significant cumulative impacts. Noise impacts from the project would be mitigated through a wide range of actions, including limiting construction noise and activities, prohibiting use of outdoor amplified music and loud non-amplified musical instruments, limiting any outdoor event activities to the picnic grove area, limiting indoor amplified music to the tasting room buildings during daytime hours, limiting hours of operation for winery, tasting room, and special event activities, and limiting industry wide and agricultural promotional events to a limited number per year with guest numbers limited. With the implementation of the mitigation measures to reduce overall noise levels generated by the winery and tasting rooms during construction activities, during winery production activities, during agricultural promotional events and industry-wide events; the noise levels at the property lines of sensitive receptors would be maintained at or below the County NE-2 standards to a level of less than significant.

Traffic volumes would be increased on Westside Road, but would not be substantial enough to change existing traffic flows or increase the level of service. Mitigation measure requires the sight distance be improved on the northerly side of the west project driveway to correct existing, unsafe driving conditions. The applicant's engineer, Adobe & Associates, prepared a Stopping Sight Distance plan depicting the sight distance can be achieved to meet standards by trimming trees and shaving the northwest hillside. Adobe & Associates also prepared a video simulation showing vehicle travel with the sight distance improvements completed, adequate stopping sight distance can be achieved.

Based on the project proposal it is anticipated that pedestrian trips between the winery and tasting room will be infrequent, and limited to employees. The operation as proposed is not expected to result in any need for guests to cross from one side of Westside Road to the other. Nonetheless, a gate is required to be installed in the winery's driveway to restrict the access to the general public.

General Plan Policy AR-5g addresses concentration of uses as it states: "Local concentrations of any separate agricultural support uses, including processing, storage, bottling, canning and packaging, agricultural support services, and visitor-serving and recreational uses as provided in Policy AR-6f, even if related to surrounding agricultural activities, are detrimental to the primary use of the land for the production of food, fiber and plant materials and shall be avoided. In determining whether or not the approval of such uses would constitute a detrimental concentration of such uses, the required factors were considered:

"1. Whether the above uses would result in joint road access conflicts, or in traffic levels that exceed the Circulation and Transit Element's objectives for level of service on a site specific and cumulative basis."

Based on the 2016 Traffic Analysis prepared by W-Trans, and reviewed and accepted by the Sonoma County Transportation and Public Works Department, project generated traffic will not result in road access conflicts and would not exceed the level of service established in the Circulation and Transit Element's objectives (Refer to further discussion under item 16 Traffic Impacts below in this initial study checklist).

W-Trans explains that by using the same roadway segment Level of Service methodology in the Highway Capacity Manual it was determined that 208 vehicle trips could be added in each direction on Westside Road *before* the northbound direction would experience unacceptable LOS D operation.

W-Trans examined events sizes and even with the 300-person event proposed with this project, and assuming that as many as 150-guests arrive or depart during a single hour from the same direction, the road would retain capacity for other events having a combined total of more than 350 guests.

W-Trans explains it is reasonable to expect that up to 75 percent of event traffic would come from the south. Assuming this is split, the largest event for the proposed project would generate 75 guests from the north or 30 vehicles, leaving capacity for the cumulative demand associated with nearly 450 guests arriving and departing from other area wineries during the same, single hour.

With an emphasis that all these trips would need to occur during a *single hour* for the cumulative impact to be experienced, if the trips are spread over more than an hour's time, the cumulative effect is diluted. Based on their review, W-Trans concludes there is adequate capacity for the multiple events to generate trips simultaneously without having a significant negative impact on operation of Westside Road.

To avoid the potential for multiple large events occurring simultaneously, PRMD has conditioned and encouraged wineries to coordinate event schedules amongst each other. The applicant is willing to do implement such coordination with the closest wineries.

“2. Whether the above uses would draw water from the same aquifer and be located within the zone of influence of area wells”.

In January 2017, a Geologic Report (Report) was prepared for the project by EBA Engineering. The Report explains the property is currently equipped with five water supply wells located along the eastern margin of the property. Well #1 will provide water supply for the winery and various domestic uses associated with the project. Based on the projections, the total water demand for these sources equates to 1,020,946 gallons per year (GPY). In addition to total water use, the average daily and maximum peak daily demands were estimated using the same data. The average daily demand over a 365-day period equates to 2,652 gallons per day (GPD). The maximum peak daily demand, in turn, was estimated by combining applicable site activities that could theoretically occur in a given day. Information provided by the Applicant indicates that these activities could include: crush operations (3,600 GPD); promotional event visitors (300 GPD); tasting room visitors (63 GPD); marketing accommodations (240 GPD); and associated employees (360 GPD). This translates to a maximum peak daily demand of 4,563 GPD.
Well #3 will be used for landscape irrigation. As outlined above, the projected total water demand for landscaping is 52,863 GPY. This translates to an average daily demand over a 365-day period of 145 GPD. In regards to the maximum peak daily demand, the maximum use occurs over the period of June through August (22,536 gallons). Assuming a conservative irrigation cycle of one day per week, the corresponding peak maximum daily demand equates to approximately 1,735 GPD for landscaping.

EBA concludes that the water supply characteristics of the underlying aquifer utilized by Wells #1 and #3 are more than adequate to accommodate the water demands associated with the proposed improvements and will not result in negative impacts to local groundwater or surface water resources. This conclusion is based on the following variables:

1) The site is located within a Class 1 water area, which is identified in the Sonoma County General Plan as a major groundwater basin;

2) The underlying aquifer is comprised of alluvial deposits associated with the Russian River, which is a managed water system that ensures perennial flow throughout the year and serves as a continuous source of recharge to the aquifer;

3) Well capacity test results for Well #1 demonstrated a sustainable yield of 45 GPM while only inducing 1.5 feet of drawdown. This is indicative of a highly prolific aquifer system;

4) Based on the yield characteristics of the on-site wells, the wells will only have to pump for less than two hours (Well #1) and six minutes (Well #3) per day to accommodate the peak water flow demands; and

5) The projected radius of influence characteristics induced by the pumping operations will not encroach onto neighboring properties. In addition, the proposed water use is projected to induce no measureable changes in surface water flows in the Russian River.

Under General Plan Policy WR-2d, the Use Permit, if approved, is subject to a condition that requires groundwater monitoring for new or expanded discretionary commercial and industrial uses using wells. Where justified by the monitoring program, establish additional monitoring requirements for other new wells.

“3. Whether the above uses would be detrimental to the rural character of the area.”

The project site is 75 acres with approximately 42 acres are currently planted in grapes, of the remaining 33 acres, 3.75 acres are comprised of existing and proposed development, comprising of 5 % of the total parcel size which is not significant as the majority of the total acreage remains in agricultural production. None of the existing vineyard will be removed to accommodate the proposed uses or site infrastructure.

The proposed project includes a new winery and wine caves on the west side of Westside Road, and on the east side of Westside Road the re-purposing/refurbishing of two existing hop kiln buildings into tasting rooms and marketing accommodations. The project includes the construction of parking areas, driveways and the enlarging of the existing driveways in order to meet fire safe standards. The proposal also includes 22 agricultural promotional events with a range of guests (10 events and 30 guests, 5 events with 60 guests, 5 events with 120 guests, and 2 events with 300 guests) and participation in an industry-wide event totaling two (2) day events with a maximum of 300 guests for a total of 24 events.

The winery and tasting room uses are considered agricultural related uses serving the large commercial vineyard. The project site would remain devoted to agricultural uses and the project will not result in conversion of farmland or cultivated area to any non-agricultural use. The new winery building and wine caves are located outside of the 200-foot Scenic Corridor setback for Westside Road. The proposed project including the winery building design and architecture and the refurbishing of the two existing hop kiln building was reviewed in a joint meeting with the Sonoma County Landmarks Commission and the Design Review Committee who had no objection to the design, or height of the building, but did recommend minor revisions.

In addition, the project has the potential to result in individually limited but cumulatively considerable impacts with respect to noise. However, project mitigation measures incorporated into the project will reduce the potential for significant cumulative impacts. Noise impacts from the project would be mitigated through a wide range of actions, including limiting construction noise and activities, prohibiting use of outdoor amplified music and very loud musical instruments, and limiting hours of operation for winery, tasting room, and special event activities. Traffic volumes would be increased on Westside Road, but would not be substantial enough to change existing traffic flows or create an unsafe driving condition. Mitigations require modifications to the project site embankment and landscape to improve sight distance and public safety on this stretch of Westside Road. Also a mitigation limits the guest capacity for agricultural promotional events to a 30-guest maximum on the west side of the project site. This will limit the number vehicles accessing and exiting the project site for an event to 12 or less using the standard ratio of 2.5 persons per vehicle.

Furthermore, as noted in this Initial Study, this project as conditioned will not result in significant adverse impacts related to aesthetics, agricultural resources, air quality, biological resources, cultural resources, greenhouse gas, hydrology and water quality, land use, noise, and parking and traffic were addressed in the Initial Study. Due to the limited size and nature of the project the extent of impact in these issue areas when considered with the effects of past, current and probable future projects, will not result in any cumulative land use impacts with mitigations incorporated into the project.

c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	Potentially Significant Impact	Less than Significant with Mitigation Incorporation	Less than Significant Impact	No impact

		X		

Comment:
18.c. No
Potential substantial adverse effects on human beings were identified in the areas of aesthetics, air quality, biology, hydrology and water quality, noise, and traffic-parking. Mitigation is proposed that would reduce impacts to less than significant levels. The project will not have a significant impact after mitigation is implemented. The project would not result in any significant changes to the existing environment. Based on the discussion and information provide in this initial study, the project’s environmental effects will not cause substantial adverse effects on human beings, either directly or indirectly.

Supplemental Application Information

Existing use of property: Vineyard; single-family residence.

Acreage: 75

Existing structures on property: Single family residence; hop kiln; baling barn; two non-residential cottages; barn; pole barn; pump house; construction trailer

Proximity to creeks, waterways and impoundment areas: Adjacent to Russian River

Vegetation on site: 42 acres of vineyard; many oaks, bay laurels, buckeye, willows, black walnut, cottonwood

General topography: Flat, rising to west

Surrounding uses to (Note: An adjoining road is not a use.)

North: Vineyard, tasting room

South: Residence, Russian River

East: Russian River; County park

West: Vineyards, winery

New structures proposed (size, height, type): Existing hop kiln and baling barn footprints increased nominally by required egress stairs; height unchanged. New winery built into west side hill with a 75' x 290' footprint, a front elevation height of 28' and bermed at the rear.

Number of employees: Full time: 15 Part time: 3 Seasonal: 6

Operating days: Tasting 7 days; winery Mon-Fri except 7 days during harvest

Hours of operation: Tasting 11-5; winery 8-5 except 8-10 during harvest.

Number of vehicles per day: Passenger: 87 Trucks: 5

Water source: Three wells on property

Sewage disposal: Leach field; pre-treated drip irrigation.

Provider, if applicable:

Provider, if applicable:

New noise sources (compressors, power tools, music, etc.): Infrequent music during summer daytime hours; air compressor; wine press operation; bottling line.

Grading proposed: Amount of cut (cu. yds.): 14,600 Amount of fill (cu. yds.): 150 Will more than one acre be disturbed by construction of access roads, site preparation and clearing, fill or excavation, building removal, building construction, equipment staging and maintenance, or other activities? Yes x No ___ If Yes, indicate area of disturbance(acres): 2.8

Identify method of site drainage (sheet flow, storm drain, outflow to creek or ditch, detention area, etc.): Sheet flow and existing ditch flow.

Vegetation to be removed: Almost none; a few trees which will be replaced.

Will proposal require annexation to a district in order to obtain public services: Yes ___ No x

Are there currently any hazardous materials (chemicals, oils, gasoline, etc.) stored, used or processed on this site? Yes x No ___

Will the use, storage, or processing of hazardous materials occur on this site in the future if this project is authorized? Yes x No ___

Fire safety information (existing/proposed water tanks, hydrants, emergency access and turnaround, building materials, etc):

COUNTY OF SONOMA

Ramey Vineyards, LLC (David and Carla Ramey) - UPE14-0008

County Use Permit Application--Proposal Statement

Dated October 3, 2014

7097 Westside Road, Healdsburg, CA 95448

Proposal Summary

This property, known as Westside Farms, totals 75 acres in one parcel, 42 acres of which are planted to wine grapes. Six and one-half acres lie to the west of Westside Road and currently contain a residence, a barn, a pole barn, two outbuildings and a 3½ acre-foot reservoir. On this side of the property we wish to construct a 60,000-case winery comprised of caves and, in front of the caves, a cut-and-fill, low-profile, two-story winery building, which will not be visible from Westside Road. Grapes will be locally sourced, primarily on-site and from Sonoma County, as well as from bordering counties.

To the east of Westside road, vineyard extends to the tree line adjacent to the Russian River. Near the entrance from Westside Road are a hop kiln and a baling barn, built in 1949, which have fallen into disrepair. We wish to refurbish the hop kiln into a public tasting room, leaving the exterior similar to its current appearance while maintaining the furnace and ductwork in the south side to demonstrate the building's original use. We wish to refurbish the three-story baling barn as a private, invitation-only tasting room: equipment storage on the ground level; a kitchen and meeting area for private tastings and meals on the mid-level; and two bedrooms as marketing accommodations on the top level, with two work stations. These accommodations will be used solely as approved by applicable zoning. The two barns will be connected by an elevated walkway evoking the railcar trestle which during the hop harvest carried dried hops from the kiln to the baling barn. The baling barn will also be refurbished to maintain its current appearance.

Past uses of the property

As far back as the mid-1800s this property has been in agriculture: fruit orchards, hops, and now grapes. Purchased by Ron and Pam Kaiser in 1988, this property was christened Westside Farms and operated as a pumpkin patch and farm store with hay rides starting in 1989 and continuing until 2000. Wine grapes were planted in 1990 and the vineyard currently produces approximately 250 tons of grapes annually. Initially, during the mid-nineties, Westside Farms was open five to six days each week from May through November. After that they were open to the public seven days a week during the month of October. Weekdays were focused on school groups totaling 200-400 children plus parents arriving in school buses and car pools, with an additional 100-200 children arriving after school. Weekends would see 300 to 1000 cars arriving over the course of a day with 400-600 maximum people on site at any one time. At any given moment, 200-300 cars might have been parked on site.

Project Background

Founded in 1996, Ramey Wine Cellars and now Ramey Vineyards, LLC are wholly owned by David and Carla Ramey. The winery is currently housed in two leased buildings in the town of Healdsburg and produces approximately 40,000 cases of wine annually with its own staff and equipment. The wine has been widely critically acclaimed and is distributed nationally and internationally. David Ramey has been a resident of Sonoma County since 1980 and has worked as winemaker at several Sonoma County wineries, including Simi, Matanzas Creek and Chalk Hill, along with Dominus and Rudd in the Napa Valley. Ramey Wine Cellars employs fifteen people, thirteen of whom live in Sonoma County.

The core team for the development of the project is comprised of architects Lundberg Design of San Francisco; general contractor Earthtone Construction of Sebastopol; civil engineers Adobe Associates of Santa Rosa; and geotechnical engineers Condor Earth Technologies for cave design and RGH Consultants for site work.

Project Details

The tasting room will be open from ten AM to five PM seven days a week, staffed by three employees during peak season with 75 visitors expected on a peak day. Proposed events are detailed in the attached table. The tasting room will be closed to the public on special event days. Depending on the size of the event, they will be held either in the baling barn (private tasting room); in the open space between the hop kiln and the baling barn; under the black walnut grove between the vineyard and the Russian River; or in the winery. Domestic flows will be discharged to septic systems designed adjacent to the tasting room and near the existing farm house. Winery process waste water will be collected, aerated and stored in a series of tanks for discharge by irrigation to the land. A Waste Discharge Permit from the North Coast Water Quality Control Board will be obtained and maintained.

Preliminary Studies

A traffic study has been completed by Whitlock & Weinberger Transportation. Their conclusion is that "A left-turn lane is neither warranted nor recommended on Westside Road at the project's driveway," and that the property's "prior use generated substantially more event traffic during the month of October than the currently proposed project will generate over the course of an entire year."

A noise assessment study was completed by Illingworth & Rodkin. Their conclusion is that amplified music and speech at events should occur only during daytime hours (7:00 a.m. to 10:00 p.m. per the report) within the private tasting (baling) barn or in the picnic (black walnut) grove. This conforms to our plans.

A greenhouse gas emissions analysis was completed by Illingworth & Rodkin. Their conclusion is that total direct and indirect emissions are projected to be only 43% of the operational threshold recommended by BAAQMD for new projects, and that "the project's GHG emissions would *not significantly* contribute to a cumulative impact on global climate change." A potential reduction in emissions may be realized when the approximately 200 tons of Chardonnay grown on the property are no longer trucked elsewhere in Sonoma County (principally Sonoma Valley) but instead are processed on site.

Additionally, we plan on continuing the stewardship of the property's agricultural heritage in a number of ways. We have completed an extensive repair of an eroding bank of the Russian River in the northeast corner of the property, a project completed by BioEngineering Associates. We're working with Master Gardener Janine Weaver of Garden Weaver Designs to select plant materials for landscaping that will be successful on our site. There will be raised bed planters for vegetables and herbs between the hop kiln tasting room and Westside Road as well as elsewhere on the property. We've spoken with Vinny Cilurzo of Russian River Brewing Company about planting a correct selection of hops which we'll then provide for their brewing. We've engaged arborist Frederick Frey of Vintage Tree Care to prune existing trees and cull those that are past their prime. We've engaged Chris Conrad of Bee Conscious to relocate nine bee colonies from the hop kiln walls to hives elsewhere on the property. We collaborated with the Russian River Wild Steelhead Society and CA Fish and Game in installing root wads along our banks of the Russian River to provide fish habitat. And as existing grape contracts expire and we assume control of the vineyard, we'll move to Integrated Pest Management utilizing Biological Control to minimize chemical inputs. We, and our children, plan on being stewards of this property for generations.

In order to meet anticipated Use Permit conditions requiring that permits be obtained from multiple government agencies, we request additional time for the Use Permit filed under UPE14-0008, as allowed under Section 26-92-130 of the Zoning Code. We request a four-year Use Permit with a one-year extension. Thank you.

Preliminary Stormwater Mitigation Plan
For
Ramey Winery
7091 Westside Road – Healdsburg, California

Project Description

The Ramey Winery Project is located on Westside Road, west of Highway 101 in Healdsburg, California. The project proposes the construction of two new driveway entrances, proposed winery storage building, wine caves, tasting room improvements, and additional parking.

The existing property consists of flat to gentle sloping terrain with slopes ranging between 5-15 percent. There are several existing buildings on site, an existing pond, existing gravel driveways, and other improvements on site. The existing septic system will be abandoned under a separate permit. A new septic system under a separate permit is proposed. The existing building in the proposed leach field expansion area will be demolished.

City of Santa Rosa LID Worksheets

See Appendix A for the City of Santa Rosa LID Worksheets.

Identified Pollutants of Concern

Identified pollutants of concern include the following:

Source	**Pollutants of Concern**
Landscape and planting areas	Sediment, nutrients, pesticides, pathogens, trash and debris
Parking lots and driveways	Sediment metals, total petroleum hydrocarbons, trash

Source Controls

Runoff from on-site driveway, parking lot and roofs will be directed to on-site vegetated buffer areas to allow for treatment. These BMP's have been designed to meet the City of Santa Rosa and Sonoma County LID Manual requirements. Potential source controls are listed below:

- Design landscaping to prevent sediment entering the storm drain system.
- Design landscaping to meet vector control requirements (draw down less than 72 hours).
- Direct runoff from impervious areas to pervious landscaped areas prior to discharge into a storm drain system.
- Incorporate Integrated Pest Management (IPM) principles and techniques for design and maintenance.
- Maximize pervious area to the maximum extent practicable.
- Design irrigation system to minimize overspray and runoff. Design landscape to minimize the use of fertilizers and pesticides
- Select plant materials that may be properly maintained with minimal water use

- Design and maintain landscaping to prevent runoff from contacting bare earth and conveying sediment to the storm drain system.
- Contain litter and trash so that it is not dispersed by the wind or runoff during waste removal.

Channel Forming Discharge:

Drainage from the Winery parking area will be directed toward a drop inlet in the center island area that will outfall upslope of the existing pond. Runoff in the area of the turnout and driveway entrance will be directed toward an existing roadside swale along Westside Road. Runoff in the area of the Tasting Room improvements will be allowed to sheet flow through existing vegetation toward the eastern property line. There will be a slight increase in runoff for the 2-year 24-hour storm as a result of the proposed improvements. The increase in the runoff in the area of the Winery improvements will be captured in the existing pond. The existing pond will have capacity to capture the Delta Volume increase; treatment will be achieved by allowing the runoff to flow through vegetated buffer areas prior to entering the pond. There will be a slight increase in runoff east of the tasting room improvements that will be able to infiltrate into the existing vegetation prior to exiting the property. See attached "Infiltration Field Analysis" for more detail.

Responsibility for BMP Maintenance

Monitoring and maintenance of the project site shall be done by the project's owner. Language regarding the responsibility for maintenance is included here in. Information includes a maintenance plan, annual reporting, access to property, and remediation of problems where:

1. **Maintenance Plan.** The project's owner must prepare a maintenance plan, the implementation of which will keep the proposed source and treatment controls operating as originally designed and approved. At a minimum the Maintenance Plan shall include: the scope and frequency for inspection and scheduled maintenance, provisions for unscheduled maintenance, estimated design life, and costs associated with the design life including replacement.
2. **Annual Report.** Each year the entity responsible for maintenance is required to complete an annual report that includes copies of completed inspection and maintenance checklists to document that maintenance activities were conducted during the previous year. The annual report shall be retained for a period of at least five years and made available upon request by the County of Sonoma.
3. **Access to Property.** Permission is granted to the County of Sonoma staff, the Regional Water Board, and Marin/Sonoma Mosquito & Vector Control District to enter the property to verify that maintenance is being conducted in accordance with the maintenance plan. Easements may be required. The Marin/Sonoma Mosquito & Vector Control District also requires that physical access, such as a gate, be provided so that staff can monitor and treat mosquitoes.
4. **Remediation of Problems.** In the event adequate maintenance is not conducted, county staff is allowed the option to enter the property and take necessary steps to restore the BMPs to good working order. The property owner will be responsible for reimbursing the city or county for expenditures associated with restoring the BMPs to good working order.

Conclusion

Runoff from the impervious roof and hardscape areas will be directed towards the proposed vegetated buffer areas. There will be no retention required as there is no increase from the pre-construction to post-construction conditions. In brief, the BMPs proposed for this project, the vegetated buffer areas will provide the treatment necessary to meet County of Sonoma LID requirements.

APPENDIX A

City of Santa Rosa LID Worksheets

STORM WATER CALCULATOR*

***Go to www.srcity.org/stormwaterlid for the latest version of the calculator**

Project: Ramey Winery
Address/Location: 7097 Westside Road Healdsburg, CA
Designer: KH
Date: November 25, 2013
Inlet Number/Tributary Area/BMP: A1

NOTE: In order for this calculator to function properly **macros must be enabled.**

Physical Tributary Area that drains to Inlet/BMP = 508,630 ft^2

This portion of the Storm water Calculator is designed to account for pollution prevention measures implemented on site. Additional information and description of these measures can be found in the Fact Sheets in Appendix F and in Chapter 4 of the narrative.

Disconnected Roof Drains [1]

Input:

Select disconnection condition: Runoff is directed across landscape; Width of area: 5' to 9'
Condition Factor = 0.25

Method 1: **Based on the total rooftop drainage area** - to be used if rooftop information is known.

Input:

Enter amount of rooftop area that drain to disconnected downspouts = 0 ft^2
Rooftop Area Factor = 0.00 Rooftop Area Factor= (Total Rooftop Disconnected Area/Tributary Area)

Solution:

Area reduction = (Physical Tributary Area x Conditional Factor x Rooftop Area Factor)

(508,630 x 0.25 x 0.00) = 0.00 ft^2 **Rooftop Drainage Area Reduction**

Method 2: **Based on density (units per acre)** - to be used if rooftop information is unknown.

Input:

Enter percent of rooftop area to be disconnected from downspouts: 0 %

Select Density: 3-4 Units per Acre
Density Reduction Factor= 0.19

Solution:

Area reduction = (Physical Tributary Area x Conditional Factor x Percent Disconnected x Density Factor)

(508,630 x 0.25 x 0.00 x 0.19) = 0.00 ft^2 **Density Reduction**

NOTE:
Either Method 1 (rooftop area) or Method 2 (density) can be used. Providing input for both methods will cause an error. If rooftop area information is available, Method 1 should be used.

[1] *See "Impervious Area Disconnection" Fact Sheet in Appendix E for further details.*

[2] See "Interceptor Trees" Fact Sheet in Appendix E for further details and see "Plant and Tree List" in Appendix G for approved trees.

[3] See "Vegetated Buffer Strip" and "Bovine Terrace" Fact Sheets in Appendix E for further details.

[4] *Total area reductions due to pollution Prevention Measures cannot exceed 50% of the physical Tributary Area.*

[5] *Per the "Urban Hydrology For Small Watersheds" TR-55 manual.*

[6] *Q in feet of depth as defined by the "Urban Hydrology For Small Watersheds" TR-55 Manual.*

[7] *From Sonoma County Water Agency Flood Control Design Criteria.*

[8] *Hydrologic soil type based of infiltration rate of native soil as defined by "Urban Hydrology For Small Watersheds" TR-55 Manual.*

[9] *Composite CN calculated per "Worksheet 2 Part 1 of the Urban Hydrology For Small Watersheds" TR-55 manual.*

[10] *From "Using Site Design to Meet Development Standards For Storm water Quality" by the Bay Area Storm water Management Agencies Association (BASMAA).*

APPENDIX
STORM WATER CALCULATOR

Paved Area Disconnection [1]

Paved Area Type (select from drop down list): Not Directly-connected Paved Area
Multiplier = 1

Enter area of alternatively designed paved area: 0 ft²

Area Reduction = 0.00 ft²

INSTRUCTIONS:
Calculates the area reduction credit for driveways designed to minimize runoff. Enter type and area of alternate design.

Interceptor Trees [2]

Number of new ***Evergreen Trees*** that qualify as interceptor trees= 0 — **New Evergreen Trees**
Area Reduction due to new Evergreen Trees= 0 ft² — (200 ft²/tree)

Number of new ***Deciduous Trees*** that qualify as interceptor trees= 0 — **New Deciduous Trees**
Area Reduction due to new Deciduous Trees= 0 ft² — (100 ft²/tree)

Enter square footage of qualifying **existing tree canopy** = 0 — **Existing Tree Canopy**
Allowed reduction credit for existing tree canopy= 0 ft² — Allowed credit for existing tree canopy = 50 % of actual canopy square footage

Area Reduction = 0 ft² = Sum of areas managed by evergreen + deciduous + existing canopy

NOTE:
Total Interceptor Area Reduction is limited to 50% of the physical tributary area.

INSTRUCTIONS:
Calculates the area reductions credit due to interceptor trees. Includes both new and existing trees. Enter the number of new deciduous and evergreen trees and the canopy area of existing trees.

Buffer Strips & Bovine Terraces [3]

Enter area draining to a Buffer Strip or Bovine Terrace = 0 ft²

Buffer Factor = 0.7

Solution:

Area Reduction = (Area draining to Buffer Strip or Bovine Terrace) x (Buffer Factor) =

Area Reduction = 0.00 ft²

INSTRUCTIONS:
Calculates the area reduction credit due to buffer strips and/or bovine terraces. Runoff Must be direct to these features as sheet flow. Enter the area draining to these features.

Revised Tributary Area due to Pollution Prevention Measures

Physical Tributary Area = 508,630 ft^2

Tributary Area Reduction due to Pollution Prevention Measures [4] = 0.00 ft^2

Reduced Tributary Area to be used for Calculations = 508,630 ft^2

This worksheet calculates the quantity of storm water that needs to be addressed (captured and/or treated) to comply with the NPDES Storm Water Permit issued to the City of Santa Rosa and County of Sonoma by the North Coast Regional Water Quality Control Board.

Design Goal: 100% Volume Capture

Capture (infiltration and/or reuse) of 100% of the volume of runoff generated by the 85th percentile 24 hour storm event.

Formulas:

$$S = \frac{1000}{CN} - 10$$

Where:
S= Potential maximum retention after runoff (in)[5]
CN= Curve Number [5]

$$Q = \frac{[(P*K)-(0.2*S)]^2}{[(P*K)+(0.8*S)]} \times \frac{1ft}{12"}$$

Where:
Q= Runoff depth (ft) [6]
P= Precipitation (in) = 0.92
K= Seasonal Precipitation Factor [7]

0.92 inches in the Santa Rosa area, based on local historical data.

$$V = (Q)(A_r)$$

Where:
V= Volume of Storm Water to be Retained (ft^3)
A_r= Reduced Tributary Area including credit for Pollution Prevention Measures (ft^2)

Input: (Pick data from drop down lists or enter calculated values)

A_r = 508,630 ft^2
K [7] = 1.50

Drop down Lists

Select post development hydrologic soil type within tributary area [8] = C: 0.05 - 0.15 in/hr infiltration (transmission) rate
Select post development ground cover description [5] =

CN_{POST}= #N/A
OR: Composite post development CN [9] = 88

NOTE:
Entering a calculated composite CN will override selections made from the pull down menu above. Calculation worksheet should be used for all composite calculations and included with submittal.

Solution:

Volume of storm water - Post Development

S_{POST}= 1.36 in $\qquad S_{POST} = \frac{1000}{88} - 10$

Q_{POST}= 0.04145 ft $\qquad Q_{POST} = \frac{[(0.92 * 1.50)-(0.2 * 1.36)]^2}{[(0.92 * 1.50)+(0.8 * 1.36)]} \times \frac{1ft}{12in}$

V_{GOAL}= 21082.71 ft^3 $\qquad V_{GOAL}$= (0.04145)(508,630)

Where:
S_{POST}= Post development potential maximum retention after runoff (in).
Q_{POST}= *Q in feet of depth as defined by the "Urban Hydrology For Small Watersheds" TR-55 Manual.*
V_{GOAL}= Post Development Volume of Storm Water to be Retained (ft^3)

INSTRUCTIONS:
This Design Goal of 100% Capture is the ideal condition and if achieved satisfies all requirements so that no additional treatment is required and pages 4 and 5 of this calculator do not need to be completed.

NOTE:
If the Design Goal of 100% Capture is not achieved, 100% Treatment AND Volume Capture must be achieved and both pages 4 and 5 of this calculator need to be completed.

Requirement 1: 100% Treatment

Treatment of 100% of the flow generated by 85th percentile 24 hour mean annual rain event (0.2 in/hr).

Formula:

$Q_{TREATMENT} = (0.2\ \text{in/hr})(A_r)(C_{POST})(K)$ cfs

Where:

$Q_{TREATMENT}$ = Design flow rate required to be treated (cfs)
C_{POST} = Rational method runoff coefficient for the developed condition [10]
A_r = Reduced Tributary Area including credit for Pollution Prevention Measures (in Acres)
K = Seasonal Precipitation Factor [7]

C value note:
The C value used for this calculation is smaller than the value used for hydraulic Flood Control design.
The table of values can be found here.
This smaller value should not be used to size the overflow bypass.

Input:

A_r = 508,630 ft^2 = 11.68 Acres
C_{POST} [10] = 0.55
K [7] = 1.0

NOTE:
The Flow Rate calculated here should only be used to size the appropriate BMP. All associated overflow inlets and systems should be sized for the Flood Control event.

Solution:

$Q_{TREATMENT}$ = 1.28 cfs

$Q_{TREATMENT} = (0.2)(11.68)(0.55)(1.00)$

INSTRUCTIONS:
If the Design Goal of 100% Capture on page 3 of this calculator is not achieved; then Requirement 1-100% Treatment, this page of the calculator, AND Requirement 2- Volume Capture, page 5 of the calculator, **must** be achieved.

Requirement 2: Delta Volume Capture

No increase in volume of runoff leaving the site due to development for the 85th percentile 24 hour storm event.

INSTRUCTIONS:
If the Design Goal of 100% Capture on page 3 of this calculator is not achieved; then Requirement 1-100% Treatment, page 4 of the calculator, AND Requirement 2- Volume Capture, this page of the calculator, **must** be achieved.

NOTE:
If the amount of volume generated after development is less than or equal to that generated before development, Requirement 2-Volume Capture is not required.

$(C_{POST} \le C_{PRE}$ *or* $CN_{POST} \le CN_{PRE})$

Formulas:

$$S = \frac{1000}{CN} - 10$$

Where:
S= Potential maximum retention after runoff (in)[5]
CN= Curve Number [5]

$$Q = \frac{[(P \cdot K) - (0.2 \cdot S)]^2}{[(P \cdot K) + (0.8 \cdot S)]} \times \frac{1\text{ft}}{12\text{in}}$$

Where:
Q= Runoff depth (ft) [6]
P= Precipitation (in) = 0.92
K= Seasonal Precipitation Factor [7]

0.92 inches in the Santa Rosa area, based on local historical data.

$$V = (Q)(A_r)$$

Where:
V= Volume of Storm Water to be Retained (ft^3)
A_r= Reduced Tributary Area including credit for Pollution Prevention Measures (ft^2)

Input: (Pick data from drop down lists or enter calculated values)

A_r = 508,630 ft^2
K [7] = 1.5

Drop down Lists
Select hydrologic soil type within tributary area [8] = C: 0.05 - 0.15 in/hr infiltration (transmission) rate
Select predevelopment ground cover description [5] =
Select post development ground cover description [5] =
CN_{PRE} = #N/A
CN_{POST} = #N/A
OR
Composite Predevelopment CN [9] = 87
Composite Post development CN [9] = 88

Solution:

Pre Development Storm Water Runoff Volume

S_{PRE}= 1.49 in

$$S_{PRE} = \frac{1000}{87} - 10$$

Where:
S_{PRE}= Pre development potential maximum retention after runoff (in).

Q_{PRE}= 0.03793 ft

$$Q_{PRE} = \frac{[(0.92 * 1.50) - (0.2 * 1.49)]^2}{[(0.92 * 1.50) + (0.8 * 1.49)]} \times \frac{1\text{ft}}{12\text{in}}$$

Q_{PRE}= *Q in feet of depth as defined by the "Urban Hydrology For Small Watersheds" TR-55 Manual.*

V_{PRE}= 19292.34 ft^3

V_{PRE}= (0.03793)(508,630)

V_{PRE}= Pre Development Volume of Storm Water Generated (ft^3)

Post Development Storm Water Runoff Volume

S_{POST}= 1.36 in

$$S_{POST} = \frac{1000}{88} - 10$$

Where:
S_{POST}= Post development potential maximum retention after runoff (in).

Q_{POST}= 0.04145 ft

$$Q_{POST} = \frac{[(0.92 * 1.50) - (0.2 * 1.36)]^2}{[(0.92 * 1.50) + (0.8 * 1.36)]} \times \frac{1\text{ft}}{12\text{in}}$$

Q_{POST}= *Q in feet of depth as defined by the "Urban Hydrology For Small Watersheds" TR-55 Manual.*

V_{POST}= 21082.71 ft^3

V_{POST}= (0.04145)(508,630)

V_{POST}= Post Development Volume of Storm Water Generated (ft^3)

Solution: Volume Capture Requirement

Increase in volume of storm water that must be retained onsite (may be infiltrated or reused).

Delta Volume Capture= $(V_{POST} - V_{PRE})$

Delta Volume Capture= (21,082.71) - (19,292.34)

V_{DELTA}= 1790.38 ft^3

Where:
Delta Volume Capture= The increase in volume of storm water generated by the 85th percentile 24 hour storm event due to development that must be retained onsite (may be infiltrated or reused).

LID BMP Sizing Tool: 100% Volume Capture Goal; V_{GOAL}

NOTE:
LID Sizing Tool only applicable for volume based BMPs. Not required if site requires treatment only.

Formulas:

$V_{LID\ GOAL}=((V_{GOAL}))/(P)$ = 52706.78 ft³

$A_{LID\ GOAL}=(W)(L)$ = #VALUE! ft²

Where:
$V_{LID\ GOAL}$ = Required volume of soil in LID BMP.
$A_{LID\ GOAL}$ = Footprint of LID BMP area for a given depth (below perforated pipe if present).

V_{GOAL} = 21,083 ft³

$$\text{Percent of Goal Achieved} = \frac{(D)(A_{LID\ GOAL})}{V_{LID\ GOAL}} \times 100$$

Where:
P= Porosity (enter as a decimal)
D= Depth below perforated pipe if present (in decimal feet)
W= Width (in decimal feet)
L= Length (in decimal feet)

Input:

P = 0.4 as a decimal
D = - ft Below perforated pipe if present
W = - ft
L = - ft

Solution:

Percent of Goal Achieved = #VALUE! % = #VALUE!

INSTRUCTIONS:

The 100% volume capture sizing tool helps the designer appropriately size a LID BMP to achieve the design goal of 100% volume capture of the post development condition. Enter the percent porosity of the specified soil and depth below perforated pipe (if present). The width and length entries will need to be interactively adjusted until "Percent of Goal" equals 100%.

LID BMP Sizing Tool Delta Volume Capture Requirement: V_{DELTA}

NOTE:
LID Sizing Tool only applicable for volume based BMPs. Not required if site requires treatment only.

Formulas:

$V_{LID\ DELTA}=((V_{DELTA}))/(P)$ = 4475.94 ft³

$A_{LID\ DELTA}=(W)(L)$ = 1120.00 ft²

Where:
$V_{LID\ DELTA}$= Required volume of soil in LID BMP
$A_{LID\ DELTA}$ = Footprint of LID BMP area for a given depth (below perforated pipe if present).

V_{DELTA}= 1790.38 ft³

$$\text{Percent of Requirement Achieved} = \frac{(D)(A_{LID\ DELTA})}{V_{LID\ DELTA}} \times 100$$

Where:
P= Porosity (enter as a decimal)
D= Depth below perforated pipe if present (in decimal feet)
W= Width (in decimal feet)
L= Length (in decimal feet)

Input:

P = 0.4 as a decimal
D = 4.0 ft Below perforated pipe if present
W = 4.0 ft
L = 280.0 ft

Solution:

Percent of Requirement Achieved = 100.09 % = [(4.0 x 1,120) / 4,476] x 100

INSTRUCTIONS:

The Delta Volume Capture sizing tool helps the designer appropriately size a LID BMP to achieve the design requirement of the delta volume capture. Enter the percent of porosity of the specified soil and depth below perforated pipe (if present). The width and length entries will need to be interactively adjusted until "Percent of Requirement achieved" reaches 100%.

NOTE: In order for this calculator to function properly **macros must be enabled.**

Physical Tributary Area that drains to Inlet/BMP = **211,870** ft²

This portion of the Storm water Calculator is designed to account for pollution prevention measures implemented on site. Additional information and description of these measures can be found in the Fact Sheets in Appendix F and in Chapter 4 of the narrative.

Disconnected Roof Drains [1]

Input:

Select disconnection condition: **Runoff is directed across landscape; Width of area: 5' to 9'**
Condition Factor = **0.25**

Method 1: **Based on the total rooftop drainage area** - to be used if rooftop information is known.

Input:

Enter amount of rooftop area that drain to disconnected downspouts = **0** ft²
Rooftop Area Factor = **0.00** Rooftop Area Factor= (Total Rooftop Disconnected Area/Tributary Area)

Solution:

Area reduction = (Physical Tributary Area x Conditional Factor x Rooftop Area Factor)

(211,870 x 0.25 x 0.00) = **0.00** ft² **Rooftop Drainage Area Reduction**

Method 2: **Based on density (units per acre)** - to be used if rooftop information is unknown.

Input:

Enter percent of rooftop area to be disconnected from downspouts: **0** %

Select Density: **3-4** Units per Acre
Density Reduction Factor= **0.19**

NOTE:
Either Method 1 (rooftop area) or Method 2 (density) can be used. Providing input for both methods will cause an error. If rooftop area information is available, Method 1 should be used.

Solution:

Area reduction = (Physical Tributary Area x Conditional Factor x Percent Disconnected x Density Factor)

(211,870 x 0.25 x 0.00 x 0.19) = **0.00** ft² **Density Reduction**

[1] *See "Impervious Area Disconnection" Fact Sheet in Appendix E for further details.*

[2] See "Interceptor Trees" Fact Sheet in Appendix E for further details and see "Plant and Tree List" in Appendix G for approved trees.

[3] See "Vegetated Buffer Strip" and "Bovine Terrace" Fact Sheets in Appendix E for further details.

[4] *Total area reductions due to pollution Prevention Measures cannot exceed 50% of the physical Tributary Area.*

[5] *Per the "Urban Hydrology For Small Watersheds" TR-55 manual.*

[6] *Q in feet of depth as defined by the "Urban Hydrology For Small Watersheds" TR-55 Manual.*

[7] *From Sonoma County Water Agency Flood Control Design Criteria.*

[8] *Hydrologic soil type based of infiltration rate of native soil as defined by "Urban Hydrology For Small Watersheds" TR-55 Manual.*

[9] *Composite CN calculated per "Worksheet 2 Part 1 of the Urban Hydrology For Small Watersheds" TR-55 manual.*

[10] *From "Using Site Design to Meet Development Standards For Storm water Quality" by the Bay Area Storm water Management Agencies Association (BASMAA).*

City of Santa Rosa

APP IX C

STORM WATER CALCULATOR

Ra er
7079 Westside Road Healdsburg, CA
KH
B1

Paved Area Disconnection [1]

Paved Area Type (select from drop down list): Not Directly-connected Paved Area

Multiplier = 1

Enter area of alternatively designed paved area: 0 ft²

Area Reduction = 0.00 ft²

INSTRUCTIONS:
Calculates the area reduction credit for driveways designed to minimize runoff. Enter type and area of alternate design.

Interceptor Trees [2]

Number of new ***Evergreen Trees*** that qualify as interceptor trees= 0 **New Evergreen Trees**

Area Reduction due to new Evergreen Trees= 0 ft² (200 ft²/tree)

Number of new ***Deciduous Trees*** that qualify as interceptor trees= 0 **New Deciduous Trees**

Area Reduction due to new Deciduous Trees= 0 ft² (100 ft²/tree)

Enter square footage of qualifying **existing tree canopy** = 0 **Existing Tree Canopy**

Allowed reduction credit for existing tree canopy= 0 ft² Allowed credit for existing tree canopy = 50 % of actual canopy square footage

Area Reduction = 0 ft² = Sum of areas managed by evergreen + deciduous + existing canopy

NOTE:
Total Interceptor Area Reduction is limited to 50% of the physical tributary area.

INSTRUCTIONS:
Calculates the area reductions credit due to interceptor trees. Includes both new and existing trees. Enter the number of new deciduous and evergreen trees and the canopy area of existing trees.

Buffer Strips & Bovine Terraces [3]

Enter area draining to a Buffer Strip or Bovine Terrace = 0 ft²

Buffer Factor = 0.7

Solution:

Area Reduction = (Area draining to Buffer Strip or Bovine Terrace) x (Buffer Factor) =

Area Reduction = 0.00 ft²

INSTRUCTIONS:
Calculates the area reduction credit due to buffer strips and/or bovine terraces. Runoff Must be direct to these features as sheet flow. Enter the area draining to these features.

STORM WATER CALCULATOR

Revised Tributary Area due to Pollution Prevention Measures

Physical Tributary Area = 211,870 ft²

Tributary Area Reduction due to Pollution Prevention Measures [4] = 0.00 ft²

Reduced Tributary Area to be used for Calculations = 211,870 ft²

This worksheet calculates the quantity of storm water that needs to be addressed (captured and/or treated) to comply with the NPDES Storm Water Permit issued to the City of Santa Rosa and County of Sonoma by the North Coast Regional Water Quality Control Board.

Design Goal: 100% Volume Capture

Capture (infiltration and/or reuse) of 100% of the volume of runoff generated by the 85th percentile 24 hour storm event.

Formulas:

$$S = \frac{1000}{CN} - 10$$

Where:
S= Potential maximum retention after runoff (in)[5]
CN= Curve Number [5]

$$Q = \frac{[(P \cdot K)-(0.2 \cdot S)]^2}{[(P \cdot K)+(0.8 \cdot S)]} \times \frac{1\text{ft}}{12''}$$

Where:
Q= Runoff depth (ft) [6]
P= Precipitation (in) = **0.92**
K= Seasonal Precipitation Factor [7]

0.92 inches in the Santa Rosa area, based on local historical data.

$$V = (Q)(A_r)$$

Where:
V= Volume of Storm Water to be Retained (ft³)
A_r= Reduced Tributary Area including credit for Pollution Prevention Measures (ft²)

Input: (Pick data from drop down lists or enter calculated values)

A_r = 211,870 ft²
K [7] = 1.50

Drop down Lists
Select post development hydrologic soil type within tributary area [8] = C: 0.05 - 0.15 in/hr infiltration (transmission) rate
Select post development ground cover description [5] =

CN_{POST} = #N/A
OR: Composite post development CN [9] = 83

NOTE:
Entering a calculated composite CN will override selections made from the pull down menu above. Calculation worksheet should be used for all composite calculations and included with submittal.

Solution:

Volume of storm water - Post Development

S_{POST}= 2.05 in

$$S_{POST} = \frac{1000}{83} - 10$$

Where:
S_{POST}= Post development potential maximum retention after runoff (in).

Q_{POST}= 0.02596 ft

$$Q_{POST} = \frac{[(0.92 * 1.50)-(0.2 * 2.05)]^2}{[(0.92 * 1.50)+(0.8 * 2.05)]} \times \frac{1\text{ft}}{12\text{in}}$$

Q_{POST}= *Q in feet of depth as defined by the "Urban Hydrology For Small Watersheds" TR-55 Manual.*

V_{GOAL}= 5500.15 ft³

$$V_{GOAL} = (0.02596)(211{,}870)$$

V_{GOAL}= Post Development Volume of Storm Water to be Retained (ft³)

INSTRUCTIONS:
This Design Goal of 100% Capture is the ideal condition and if achieved satisfies all requirements so that no additional treatment is required and pages 4 and 5 of this calculator do not need to be completed.

NOTE:
If the Design Goal of 100% Capture is not achieved, 100% Treatment AND Volume Capture must be achieved and both pages 4 and 5 of this calculator need to be completed.

APPENDIX C
STORM WATER CALCULATOR

Requirement 1: 100% Treatment

Treatment of 100% of the flow generated by 85th percentile 24 hour mean annual rain event (0.2 in/hr).

Formula:

$Q_{TREATMENT}$ = (0.2 in/hr)(A_r)(C_{POST})(K) cfs

Where:

$Q_{TREATMENT}$ = Design flow rate required to be treated (cfs)
C_{POST} = Rational method runoff coefficient for the developed condition [10]
A_r = Reduced Tributary Area including credit for Pollution Prevention Measures (in Acres)
K = Seasonal Precipitation Factor [7]

Input:

A_r = 211,870 ft² = 4.86 Acres
C_{POST} [10] = 0.58
K [7] = 1.0

Solution:

$Q_{TREATMENT}$ = 0.56421 cfs

$Q_{TREATMENT}$ = (0.2)(4.86)(0.58)(1.00)

C value note:
The C value used for this calculation is smaller than the value used for hydraulic Flood Control design.
The table of values can be found here.
This smaller value should not be used to size the overflow bypass.

NOTE:
The Flow Rate calculated here should only be used to size the appropriate BMP. All associated overflow inlets and systems should be sized for the Flood Control event.

INSTRUCTIONS:
If the Design Goal of 100% Capture on page 3 of this calculator is not achieved; then Requirement 1-100% Treatment, this page of the calculator, AND Requirement 2- Volume Capture, page 5 of the calculator, **must** be achieved.

Requirement 2: Delta Volume Capture

No increase in volume of runoff leaving the site due to development for the 85th percentile 24 hour storm event.

Formulas:

$$S = \frac{1000}{CN} - 10$$

Where:
S= Potential maximum retention after runoff (in)[5]
CN= Curve Number [5]

$$Q = \frac{[(P*K)-(0.2*S)]^2}{[(P*K)+(0.8*S)]} \times \frac{1ft}{12in}$$

Where:
Q= Runoff depth (ft) [6]
P= Precipitation (in) = 0.92
K= Seasonal Precipitation Factor [7]

0.92 inches in the Santa Rosa area, based on local historical data.

$$V = (Q)(A_r)$$

Where:
V= Volume of Storm Water to be Retained (ft^3)
A_r= Reduced Tributary Area including credit for Pollution Prevention Measures (ft^2)

Input: (Pick data from drop down lists or enter calculated values)

A_r = 211,870 ft^2
K[7] = 1.5

Drop down Lists
Select hydrologic soil type within tributary area [8] = C: 0.05 - 0.15 in/hr infiltration (transmission) rate
Select predevelopment ground cover description [5] =
Select post development ground cover description [5] =
CN_{PRE} = #N/A
CN_{POST} = #N/A
OR
Composite Predevelopment CN [9] = 81
Composite Post development CN [9] = 83

Solution:

Pre Development Storm Water Runoff Volume

S_{PRE}= 2.35 in

$$S_{PRE} = \frac{1000}{81} - 10$$

Q_{PRE}= 0.02117 ft

$$Q_{PRE} = \frac{[(0.92*1.50)-(0.2*2.35)]^2}{[(0.92*1.50)+(0.8*2.35)]} \times \frac{1ft}{12in}$$

V_{PRE}= 4485.29 ft^3

V_{PRE}= (0.02117)(211,870)

Where:
S_{PRE}= Pre development potential maximum retention after runoff (in).
Q_{PRE}= *Q in feet of depth as defined by the "Urban Hydrology For Small Watersheds" TR-55 Manual.*
V_{PRE}= Pre Development Volume of Storm Water Generated (ft^3)

Post Development Storm Water Runoff Volume

S_{POST}= 2.05 in

$$S_{POST} = \frac{1000}{83} - 10$$

Q_{POST}= 0.02596 ft

$$Q_{POST} = \frac{[(0.92*1.50)-(0.2*2.05)]^2}{[(0.92*1.50)+(0.8*2.05)]} \times \frac{1ft}{12in}$$

V_{POST}= 5500.15 ft^3

V_{POST}= (0.02596)(211,870)

Where:
S_{POST}= Post development potential maximum retention after runoff (in).
Q_{POST}= *Q in feet of depth as defined by the "Urban Hydrology For Small Watersheds" TR-55 Manual.*
V_{POST}= Post Development Volume of Storm Water Generated (ft^3)

Solution: Volume Capture Requirement

Increase in volume of storm water that must be retained onsite (may be infiltrated or reused).

Delta Volume Capture= $(V_{POST}-V_{PRE})$

Delta Volume Capture= (5,500.15) - (4,485.29)

V_{DELTA}= 1014.86 ft^3

Where:
Delta Volume Capture= The increase in volume of storm water generated by the 85th percentile 24 hour storm event due to development that must be retained onsite (may be infiltrated or reused).

INSTRUCTIONS:

If the Design Goal of 100% Capture on page 3 of this calculator is not achieved; then Requirement 1-100% Treatment, page 4 of the calculator, AND Requirement 2- Volume Capture, this page of the calculator, **must** be achieved.

NOTE:

If the amount of volume generated after development is less than or equal to that generated before development, Requirement 2-Volume Capture is not required.

$(C_{POST} \le C_{PRE}$ *or* $CN_{POST} \le CN_{PRE})$

LID BMP Sizing Tool: 100% Volume Capture Goal: V_{GOAL}

NOTE:
LID Sizing Tool only applicable for volume based BMPs. Not required if site requires treatment only.

Formulas:

$V_{LID\ GOAL}=((V_{GOAL}))/(P) =$ 13750.36 ft³

$A_{LID\ GOAL}=(W)(L) =$ #VALUE! ft²

Where:
$V_{LID\ GOAL}$= Required volume of soil in LID BMP.
$A_{LID\ GOAL}$ = Footprint of LID BMP area for a given depth (below perforated pipe if present).

V_{GOAL} = 5,500 ft³

$$\text{Percent of Goal Achieved} = \frac{(D)(A_{LID\ GOAL})}{V_{LID\ GOAL}} \times 100$$

Where:
P= Porosity (enter as a decimal)
D= Depth below perforated pipe if present (in decimal feet)
W= Width (in decimal feet)
L= Length (in decimal feet)

Input:

P = 0.4 as a decimal
D = - ft Below perforated pipe if present
W = - ft
L = - ft

Solution:

Percent of Goal Achieved = #VALUE! % = #VALUE!

INSTRUCTIONS:

The 100% volume capture sizing tool helps the designer appropriately size a LID BMP to achieve the design goal of 100% volume capture of the post development condition. Enter the percent porosity of the specified soil and depth below perforated pipe (if present). The width and length entries will need to be interactively adjusted until "Percent of Goal" equals 100%.

LID BMP Sizing Tool Delta Volume Capture Requirement: V_{DELTA}

NOTE:
LID Sizing Tool only applicable for volume based BMPs. Not required if site requires treatment only.

Formulas:

$V_{LID\ DELTA}=((V_{DELTA}))/(P) =$ 2537.14 ft³

$A_{LID\ DELTA}=(W)(L) =$ 640.00 ft²

Where:
$V_{LID\ DELTA}$= Required volume of soil in LID BMP
$A_{LID\ DELTA}$ = Footprint of LID BMP area for a given depth (below perforated pipe if present).

V_{DELTA}= 1014.86 ft³

$$\text{Percent of Requirement Achieved} = \frac{(D)(A_{LID\ DELTA})}{V_{LID\ DELTA}} \times 100$$

Where:
P= Porosity (enter as a decimal)
D= Depth below perforated pipe if present (in decimal feet)
W= Width (in decimal feet)
L= Length (in decimal feet)

Input:

P = 0.4 as a decimal
D = 4.0 ft Below perforated pipe if present
W = 4.0 ft
L = 160.0 ft

Solution:

Percent of Requirement Achieved = 100.90 % = [(4.0 x 640) / 2,537] x 100

INSTRUCTIONS:

The Delta Volume Capture sizing tool helps the designer appropriately size a LID BMP to achieve the design requirement of the delta volume capture. Enter the percent of porosity of the specified soil and depth below perforated pipe (if present). The width and length entries will need to be interactively adjusted until "Percent of Requirement achieved" reaches 100%.

APPENDIX C

Infiltration Field Analysis

Infiltration Field Analysis

Ramey Winery

Field characteristics:		
Use:	Mixed	
Soil Type:	Yolo Loam	
Slope:	Approx 6%	
Infiltration Rate:		0.63 in/hr
Hydrologic Soil Group:		B

Storm Characteristics		
Type:	2 year, 24 hour	
Rainfall Intensity:		0.21 in/hr
100% Volume:		5500 ft^3/day

Adjust field infiltration rate to account for direct rainfall: 0.63 in/hr

\- 0.21 in/hr

Effective Infiltration Rate: 0.42 in/hr

This is the rate at which the field will infiltrate the project's increase in runoff.

Infiltration rate converted to feet per day: 0.84 ft/day

The infiltration field must be sufficiently sized to allow for capture of 100% Volume.

Required infiltration area: $\frac{5500 \text{ ft}^3\text{/day}}{0.84 \text{ ft/day}} = 6548 \text{ ft}^2$

The infiltration field must be a minimum size of 6548 ft^2 to capture the 100% Volume generated by the post development site during the 2 year, 24 hour event.

Available infiltration field: 9,080 ft^2, as shown on the Post Construction Hydrology Map

Ratio of available area to needed area: ● 1.39 Pass

Notes:

1 Field characteristics are based on data provided by the USDA Soil Survey.
2 Per 2-year post construction runoff calculations included in this report.
3 100% Volume is based on the values calculated in the LID Stormwater Calculator.

1/ Nonplastic.

2/ Water table not observed within depth of examination. Normally this is at a depth of 5 feet unless limited by bedrock or hardpan.

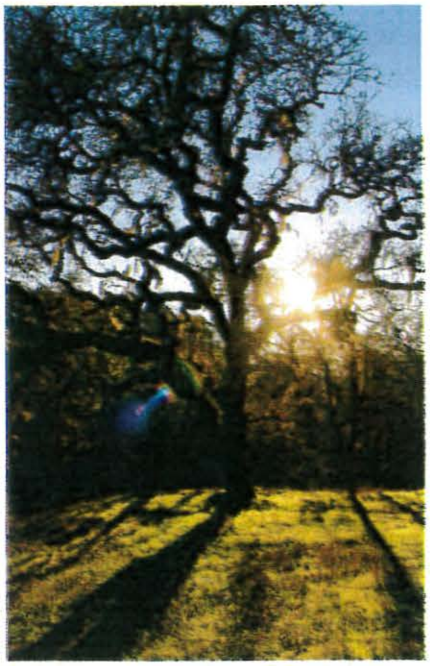
APPENDIX D

Vegetated Buffer Fact Sheets

FACT SHEET- VEGETATED BUFFER STRIP

VEGETATED BUFFER STRIP

Also know as: Filter Strip, Grassed Filter



DESCRIPTION

Vegetated buffer strips are sloping planted areas designed to allow storm water to naturally infiltrate sheet flow from adjacent impervious surfaces. Buffer strips slope away from the impervious surface and are most often vegetated with low lying ground cover. Buffer strips function by slowing storm water runoff and allowing sediment and other pollutants to settle and infiltrate. Vegetated buffer strips are well-suited to addressing runoff from roads and highways, roof downspouts, and parking lots.

ADVANTAGES

- Provides a tributary area reduction. Calculations to be completed using the Pollution Prevention Credit Calculator in Appendix C.
- Enhances water quality of downstream water bodies through natural processes.
- Aesthetically pleasing.
- Can establish habitat for birds and other pollinators like butterflies and bees.
- Require minimal maintenance (typically erosion prevention, mowing, and/or pruning).

FACT SHEET- VEGETATED BUFFER STRIP

LIMITATIONS

- Requires sufficient area.
- Ultimate storm water collection needs to be considered in design.
- May not be appropriate for industrial sites or locations where chemical spills may occur.
- A thick vegetative cover is needed for these practices to function properly.
- Prohibited in areas of known contamination. If soil and/or groundwater contamination is present on the site or within a 100' radius of the proposed location, the North Coast Regional Water Quality Control Board review and approval is required.
- Not appropriate for sites with a high risk of landslides or other geotechnical concerns. Slope stability shall be determined by a licensed Geotechnical Engineer.

KEY DESIGN FEATURES

- Slopes should not exceed 15%.
- Slope shall be at least 2%.
- Minimum length (in direction of flow) shall be 15 feet.
- Strip shall be sized as long as the site will reasonably allow.
- Vegetation whose growing season corresponds to the wet season is preferred (see Appendix A for list of locally suitable plant species).
- Strip shall be free of gullies or rills.

INSPECTION AND MAINTENANCE REQUIREMENTS

A maintenance plan shall be provided with the Final SUSMP. The maintenance plan shall include; recommended maintenance practices, parties responsible for maintenance and upkeep, specify the funding source for ongoing maintenance with provisions for full replacement when necessary, and provide site specific inspection checklist.

At a minimum inspection and maintenance shall include the following:

- Mow as needed and irrigate during dry weather to the extent necessary to keep vegetation alive. Remove obstructions and trash from vegetated buffer strip.
- Pesticides and fertilizers shall not be used in the vegetated buffer strip.
- Where mowing is required, grass height shall be maintained between 3" and 6".

Vegetated buffer strips shall be inspected and maintained twice a year to review:

- Condition of vegetation.
- Obstructions and trash.
- Ponded flow is drained within 72 hours after a rainfall event.
- If ponding is observed, grading will be required to restore positive drainage.

APPENDIX E

Operation and Maintenance Checklist

VEGETATED BUFFER STRIP- CHECKLIST

Vegetated Buffer Strip

Inspection and Maintenance Checklist
(aka: Filter Strip, Grassed Filter)

Date of Inspection: ______________________
Inspector(s): ______________________
BMP ID #: ______________________
Property Owner: ______________________

Location Description: ____

Type of Inspection: ☐ Pre-rainy Season (PRS) ☐ Rainy Season (RS) ☐ After-rainy Season (ARS)

This Inspection and Maintenance Checklist is to be used in conjunction with its corresponding LID Factsheet and Maintenance Plan. Please review these documents before performing the field inspection.

Inspection Category	When to Inspect	Maintenance Issue	Is the Issue Present?	Require Maintenance	**Comments** (Describe maintenance completed and if needed maintenance was not conducted, note when it will be done)
Drainage	RS	Is there standing or pooling of water after 3 days of dry weather?		• Remove any obstruction in the buffer strip and/or regrade to restore positive drainage. • Clean and/or remove any obstructions in and around the storm drain inlet.	
	PRS RS ARS	Is there poor drainage during a high intensity storm event?		• Clean and/or remove any obstructions in and around the storm drain inlet.	
	RS	Is the flow into the buffer strip even and uniform?		• Remove any obstruction preventing a uniform flow into the buffer strip.	

VEGETATED BUFFER STRIP- CHECKLIST

Inspection Category	When to Inspect	Maintenance Issue	Is the Issue Present?	Require Maintenance	**Comments** (Describe maintenance completed and if needed maintenance was not conducted, note when it will be done)
Erosion	RS ARS	Is there evidence of under cutting or washouts along the impervious surfaces of the buffer strip?		• Fill in eroded areas and regrade.	
	RS ARS	Is there channelization (gully) forming along the length of the buffer strip area?		• Fill in eroded areas and regrade.	
	RS ARS	Is there accumulation of sediment (sand, dirt, mud) in the buffer strip?		• Remove sediment and check the grading. Add replacement soil and or mulch.	
	PRS RS ARS	Is the mulch unevenly distributed in the buffer strip area?		• Redistribute and add additional mulch if needed. • Regrade buffer strip area.	
	PRS RS ARS	Are there voids and/or holes around the storm drain inlet?		• Inspect the storm drain inlet for damage. Replace or repair as necessary. • Fill in eroded areas and regrade.	
	PRS RS ARS	Is there evidence of animal activity such as holes or dirt mounds from digging or borrowing?		• Repair and fill in damaged areas. • Rodent control activities must be in accordance with applicable laws and do not affect any protected species.	

VEGETATED BUFFER STRIP- CHECKLIST

Inspection Category	When to Inspect	Maintenance Issue	Is the Issue Present?	Require Maintenance	**Comments** (Describe maintenance completed and if needed maintenance was not conducted, note when it will be done)
Vegetation	PRS RS ARS	Is the vegetation clogging or redirecting the inlet/outlet flow areas?		• Trim and/or remove the excess vegetation.	
	PRS RS ARS	Is the mulch distributed evenly throughout the buffer strip?		• Redistribute and add additional mulch if needed. • Regrade buffer strip area.	
	PRS RS ARS	Are there dead or dry plants/weeds? Is the vegetation over grown?		• Remove dead and/or dry vegetation. Replace as needed. • Remove or trim any vegetation that is causing a visual barrier, trip, and or obstruction hazards. • Mow grass as needed.	

VEGETATED BUFFER STRIP- CHECKLIST

Inspection Category	When to Inspect	Maintenance Issue	Is the Issue Present?	Require Maintenance	**Comments** (Describe maintenance completed and if needed maintenance was not conducted, note when it will be done)
BMP General	PRS RS ARS	Is there debris/trash in the buffer strip area?		• Remove all trash and debris.	
	PRS RS ARS	Is Graffiti present?		• Remove all graffiti from the area.	
	PRS RS ARS	Are there missing or disturbed aesthetics features?		• Replace and/or reposition aesthetics features to original placement. • Placement should not disrupt flow characteristics/design.	
	PRS RS ARS	Is the vegetation irrigation functional?		• Repaired broken missing spray/drip emitters. • Reposition and/or adjust to eliminate over spray and/or over watering.	
	PRS RS ARS	Are the aesthetic features firmly secured in place?		• Repair and/or replace loose or damaged features.	
	PRS RS ARS	Check for damaged sidewalk, curb, gutter, and catch basin. This includes uplift and settling.		• Remove and replace damaged areas.

				Water retention					
	Topsoil	Road fill	Road location	Embankments	Reservoir area	Agricultural drainage	Irrigation		
Sites: SfE, SfF	Poor: mostly clay over sandstone.	Fair to poor: A-4, A-6, or A-7.	3 to 5 feet or more deep to rock; 5 to 50 percent slopes; moderate shrink-swell potential.	Fair to poor strength; medium compressibility; fair to poor resistance to piping.	Moderately slow permeability; 5 to 50 percent slopes; 3 to 5 feet or more deep to rock.	Moderately slow permeability; 3 to 5 feet or more deep to rock.	Moderate to high available water capacity; slow intake rate; 5 to 50 percent slopes; 3 to 5 feet or more deep to rock.	Severe: moderately slow permeability; 5 to 50 percent slopes; 3 to 5 feet or more deep to rock.	B
Sobrante: ShE, ShF, ShG	Fair to depth of 20 inches: mostly clay loam.	Poor: A-6	1½ to 3½ feet deep to rock; 15 to 75 percent slopes.	Fair to poor strength; medium compressibility; poor to good resistance to piping.	Moderate permeability; 15 to 75 percent slopes; 1½ to 3½ feet deep to rock.	Drainage not needed.	Low to moderate available water capacity; moderate intake rate; 15 to 75 percent slopes; 1½ to 3½ feet deep to rock.	Severe: 15 to 75 percent slopes; 1½ to 3½ feet deep to rock.	C
Spreckels: SkC, SkD, SkE, SkE2, SkF.	Good to fair to depth of 18 inches: loam and clay loam. Poor below 18 inches: clay.	Poor: A-6 or A-7	2 to 5 feet deep to rock; 2 to 50 percent slopes; high shrink-swell potential.	Fair to poor strength; medium compressibility; fair to good resistance to piping.	Slow permeability; 2 to 50 percent slopes; 2 to 5 feet deep to rock.	Slow permeability; 2 to 5 feet deep to rock.	Low to moderate available water capacity; moderate intake rate; 2 to 50 percent slopes; 2 to 5 feet deep to rock.	Severe: slow permeability; most slopes are 9 to 50 percent; 2 to 5 feet deep to rock.	C
Steinbeck: SnC, SnD, SnD2, SnE, SnE2, SnF, SnF2.	Good to depth of 35 inches: loam. Fair below 35 inches: clay loam.	Poor: A-6	1½ to 5 feet or more deep to rock; 2 to 50 percent slopes.	Fair to poor strength; medium compressibility; good resistance to piping.	Moderate permeability; 2 to 50 percent slopes; 1½ to 5 feet or more deep to rock.	Drainage not needed.	Moderate to low available water capacity; moderate intake rate; 2 to 50 percent slopes; 1½ to 5 feet or more deep to rock.	Moderate to severe: moderate permeability; 2 to 50 percent slopes; 1½ to 5 feet or more deep to rock.	B
*Stonyford: SoF, SoG, SrG (For properties of the Boomer soil in unit SrG, see the Boomer series in this table.)	Poor to depth of 19 inches: mostly very gravelly clay loam.	Fair to poor: A-4 or A-6.	1 to 2 feet deep to rock; 30 to 75 percent slopes.	Fair strength; medium compressibility; poor to good resistance to piping.	Moderate permeability; 30 to 75 percent slopes; 1 to 2 feet deep to rock.	Drainage not needed.	Low available water capacity; moderately rapid intake rate; 30 to 75 percent slopes; 1 to 2 feet deep to rock.	Severe: 30 to 75 percent slopes; 1 to 2 feet deep to rock.	D
Supan: SsG	Mostly fair to depth of 39 inches: clay loam.	Poor: A-6	2½ to 4½ feet deep to rock; 30 to 75 percent slopes; moderate shrink-swell potential.	Fair to poor strength; medium compressibility; good resistance to piping.	Moderately slow permeability; 30 to 75 percent slopes; 2½ to 4½ feet deep to rock.	Drainage not needed.	Moderate available water capacity; moderate intake rate; 30 to 75 percent slopes; 2½ to 4½ feet deep to rock.	Severe: moderately slow permeability; 30 to 75 percent slopes; 2½ to 4½ feet deep to rock.	C

TABLE 7.--ESTIMATED ENGINEERING INTERPRETATIONS OF THE SOILS--Continued

Soil series and map symbols	Suitability as source of--		Soil features affecting--	Soil features affecting--Continued				Soil limitations for septic tank filter fields	Hydrologic soil group
				Water retention					
	Topsoil	Road fill	Road location	Embankments	Reservoir area	Agricultural drainage	Irrigation		
*Suther: StE, StE2, StF, SuF, SuG. (For properties of Laughlin soils in units SuF and SuG, see Laughlin series in this table.)	Fair to depth of 14 inches: clay loam. Poor below 14 inches: gravelly clay.	Poor: A-6 or A-7	1½ to 3½ feet deep to rock; 15 to 75 percent slopes; high shrink-swell potential.	Fair to poor strength; medium compressibility; good resistance to piping.	Slow permeability; 15 to 75 percent slopes; 1½ to 3½ feet deep to rock.	Drainage not needed.	Low to moderate available water capacity; moderate intake rate; 15 to 75 percent slopes; 1½ to 3½ feet deep to rock.	Severe: slow permeability; 15 to 75 percent slopes; 1½ to 3½ feet to rock.	C
Toomes: ToE, ToG	Fair to depth of 13 inches: clay loam.	Poor: A-6	½ to 1½ feet deep to rock; 2 to 75 percent slopes; rocky.	Fair to poor strength; medium compressibility; fair to poor resistance to piping.	Moderate permeability; 2 to 75 percent slopes; ½ to 1½ feet deep to rock.	Drainage not needed.	Low available water capacity; moderate intake rate; 2 to 75 percent slopes; ½ to 1½ feet deep to rock.	Severe: ½ to 1½ feet deep to rock; most slopes are 9 to 75 percent.	D
Tuscan: TuC, TuE	Poor: cobbly clay loam and very gravelly clay.	Good to poor: A-2, A-4, and A-6.	1 to 2 feet deep to hardpan; 0 to 30 percent slopes; cobbly.	Fair strength; medium compressibility; good resistance to piping.	Very slow permeability; 0 to 30 percent slopes; 1 to 2 feet deep to hardpan.	Very slow permeability; 1 to 2 feet deep to hardpan.	Low available water capacity; slow intake rate; 0 to 30 percent slopes; 1 to 2 feet deep to hardpan.	Severe: very slow permeability; 1 to 2 feet deep to hardpan.	D
Wright: WgC, WhA, WmB, WoA.	Good to depth of 25 inches: loam. Poor below 25 inches: clay.	Fair to depth of 25 inches: A-4. Poor below 25 inches: A-7.	2 to 3 feet deep to water table; 0 to 9 percent slopes; high shrink-swell potential.	Fair to poor strength; medium compressibility; fair to good resistance to piping.	Very slow permeability; 0 to 9 percent slopes; 2 to 3 feet deep to water table.	Very slow permeability; 2 to 3 feet deep to water table.	Low to moderate available water capacity; moderate intake rate; 0 to 9 percent slopes; 2 to 3 feet deep to water table.	Severe: very slow permeability; 2 to 3 feet deep to water table.	C
Yolo: YlA, YmB, YnA, YoB, YrB, YsA, YtA.	Good for YnA, YrB, YsA: loam and silt loam. Fair to depth of 15 inches: sandy loam, gravelly loam, and clay loam. Good below 15 inches: loam.	Fair to poor: A-4 to A-6.	Most features favorable	Fair to poor strength; medium compressibility; poor to good resistance to piping.	Moderate permeability; 0 to 5 percent slopes.	Drainage not needed.	High available water capacity; moderate intake rate; 0 to 5 percent slopes.	Moderate: moderate permeability. Severe for YmB, YoB: subject to flooding	B
*Yorkville: YuE, YuF, YvF, YwF, YwG. (For properties of Laughlin soils in unit YvF and Suther soils in units YwF and YwG, see their respective series.)	Fair to depth of 19 inches: clay loam. Poor below 19 inches: clay.	Poor: A-6 or A-7	2 to 5 feet deep to rock; 5 to 75 percent slopes; high shrink-swell potential.	Fair to poor strength; medium to high compressibility; good resistance to piping.	Very slow permeability; 5 to 75 percent slopes; 2 to 5 feet deep to rock.	Very slow permeability; 5 to 75 percent slopes; 2 to 5 feet deep to rock.	Moderate to high available water capacity; slow intake rate; 5 to 75 percent slopes; 2 to 5 feet deep to rock.	Severe: very slow permeability; most slopes are 9 to 75 percent; 2 to 5 feet deep to rock.	D
Zamora: ZaA, ZaB	Fair to depth of 55 inches: clay loam. Poor below 55 inches: gravelly clay.	Fair to poor: A-4 or A-6.	High shrink-swell potential below depth of 55 inches.	Fair to poor strength; medium compressibility; fair to good resistance to piping.	Moderately slow permeability; 0 to 5 percent slopes.	Drainage not needed.	High available water capacity; slow intake rate; 0 to 5 percent slopes.	Severe: moderately slow permeability.	B

APPENDIX G

Determination Worksheet

Standard Urban Storm Water Mitigation Plan Questionnaire

NPD-004

PURPOSE: Storm water is the largest source of pollution in creeks and rivers. Projects are required to prevent storm water pollution and clean storm water before it leave a project site. This form is used to determine if a project is subject to special regulation on storm water.

Applicant: ☒ Owner ☐ Engineer ☐ Architect ☐ Landscape Architect ☐ Contractor ☐ Developer

Ramey Vineyards, LLC
Name

P. O. Box 788
Mailing Address

Healdsburg, CA 95448
City/Town State/Zip

(707) 433-0870 (707) 433-6311
Phone Fax

Project Site Information:

7091 Westside Road
Street Address

Healdsburg
City/Town

110-240-031 & 040
Assessor's Parcel Number

Permit Number(s)

QUESTIONNAIRE:

To determine if a project is subject to the requirements of SUSMP, please answer the following questions. If you are unable to answer any questions or if you checked unknown, you may consult a PRMD National Pollutant Discharge Elimination System (NPDES) staff member, or your design professional.

☒ Yes ☐ No ☐ Unknown	1. Is the project within either of the two NPDES boundaries? Check the box below for either the North Coast Regional Water Quality Control Board or the San Francisco Bay Regional Water Quality Control Board. See attached map. ☒ North Coast ☐ San Francisco Bay
☒ Yes ☐ No ☐ Unknown	2. Does the project create one (1) acre (43,560 square feet) or more of new impervious surface <u>or</u> is it directly adjacent to a waterway <u>or</u> does it require a new storm drain outfall?
☒ Yes ☐ No ☐ Unknown	3. Does the project require a discretionary permit or any ministerial permit(s) related to a discretionary permit (e.g. a grading or building permit for a project subject to a use permit or other discretionary land use approval)?

ACKNOWLEDGMENT:

I, as the applicant, understand that a Yes answer to **all** of the above questions means the project is a SUSMP applicable project subject to the requirements of SUSMP guidelines. Any unknown responses must be resolved to determine if the project is subject to SUSMP requirements. The applicant must complete the Preliminary Storm Water Mitigation Plan Worksheet (NPD-005) for all applicable SUSMP projects.

I. SUSMP Project Description Worksheet

This worksheet provides fundamental information about the project. The information will be used in understanding the extent of the project and reviewing the project.

1. Total Lot or Parcel area: 3,244,467 square feet or 74.48 acres.

2. Existing land use(s):
   ☑ Commercial ☐ Industrial ☐ Residential ☐ Public ☑ Agricultural ☐ Vacant
   Please describe: (number of buildings, use of buildings)

   There are approximately 6 existing buildings that are used for Agricultural and light Commercial use.

3. Proposed land use(s): ☑ Commercial ☐ Industrial ☐ Residential ☐ Public ☐ Other
   Please describe: (number of buildings, use of buildings)

   Two of the existing buildings will be demolished, the site will be used as a tasting room and winery production building with wine caves.

4. Does the project include any of the following? (check all that apply):
   - ☐ Vehicle cleaning for fleets or commercial facilities
   - ☐ Vehicle cleaning for multifamily residential developments
   - ☐ Vehicle repair/maintenance
   - ☐ Outdoor process activities (examples of businesses that have outdoor process activities include machine shops, auto repair shops, and industries that have pretreatment facilities)
   - ☐ Fuel dispensing areas
   - ☑ Food service
   - ☐ Refuse disposal areas

5. Describe / name any water body(ies) that will receive storm water flows from the project (include both the immediate receiving water body, and water bodies further downstream):

   Russian River is approximately 800 feet from the nearest point of improvements. It will indirectly receive stormwater that has sheet flowed through adjacent vineyards.

6. Are any hydrologic features on or directly adjacent to project site? (Examples of hydrologic features include wetlands, seeps, springs, natural waterways, modified natural waterways, constructed channels.)
   ☐ No ☑ Yes (If yes, describe / name):

   There is an existing roadside swale along Westside Road, also on-site is an existing pond. A cutoff swale is proposed upslope of the proposed Winery Building

7. Will a new storm drain outfall be constructed as part of the project?
   ☐ No ☑ Yes (If yes, describe / name):

   A new stormdrain outfall is proposed upslope of the existing pond, there is a stormdrain that will be extended in the area of the Tasting Room improvements.

8. Identify natural features located on site (check all that apply and indicate existing and proposed square footage)

Natural Feature	Existing Size	Proposed Size	Size Change
	Choose: ☐ Square Feet ☑ Acres		Indicate decrease with -symbol
☐ Riparian area[1]			0.00
☐ Wetland			0.00
☑ Steep slopes (10% or greater)	3.40	3.40	0.00
☑ Areas of native vegetation	9.01	7.33	-1.67
☑ Areas containing tree canopy	2.46	2.17	-0.29
☐ Other:			0.00

9. Attach the project site plan to this completed Project Description Worksheet. At a minimum, site plans must include: (see form CSS-019)
   a. Date, scale, legend and north arrow
   b. Lot lines
   c. Locations of existing buildings, structures and impervious surfaces
   d. Proposed buildings, structures, impervious surfaces and storm water
   e. Best Management Practices (BMPs) device or structures
   f. Existing contours and proposed grades
   g. Locations of existing and proposed natural features (as identified in item 8)
   h. Locations of proposed landscaping
   i. Locations of proposed activities of concern (as identified in item 4)

II. SUSMP Impervious Surface Worksheet

Complete at the planning permit application stage. Project phasing to decrease impervious surface area shall not exempt the project from SUSMP requirements. Incorrect impervious area calculations may delay processing of your project application(s) and/or permit(s).

Type of Impervious Surface Impervious surfaces are all areas where improvements result in a ground surface that significantly limits natural percolation rates including, but not limited to, asphalt, cement, pavers, buildings, and plastic liners	**Pre-Project Impervious Surface**	**Project Impervious Surface**		**Total of New and Reconstructed Impervious Surface**
		New	**Reconstructed**	
	Choose: ☐ Square Feet ☑ Acres			
Main building footprint, including attached garage		0.46		0.46
Detached garage, carport, shed, other misc. structures	0.30	0.25		0.25
Patio, impervious decking, pavers and impervious liners	0.35			0.00
Impervious driveway, parking lot		1.29		1.29
Streets, roads, sidewalks and other defined walkways				0.00
Off-site impervious improvements	Not Applicable			0.00
Total impervious surface in square feet	0.65	2.00	0.00	2.00

Check box if the total of new impervious surface plus any reconstructed impervious surface is greater than or equal to: ☑ One (1) acre (43,560 square feet).

If the total of new impervious surface plus any reconstructed impervious surface is greater than or equal to one (1) acre (43,560 square feet), a Storm Water Mitigation Plan is required.

---

[1] Riparian area means the streambank and floodplain between a stream (or other body of water) and the adjacent upland area.

III. SUSMP Proximity to Waterway(s) Worksheet

Complete at the planning permit application stage for all projects that require a discretionary permit, including any ministerial permits that are based on the discretionary permit, and that are directly adjacent[2] to a natural waterway[3], modified natural waterway[4], or constructed channel[5]. Incorrect information regarding a waterway or channel may delay your project application(s) and/or permit(s).

Method for determining proximity (check all that apply):
☐ Conducted site visit
☑ USGS map name 20E
☐ Consulted agency personnel (name and agency) ______

Type of Waterway	Name of Waterway or other Identifier	Directly adjacent to project?
Natural waterway	**Russian River**	☐ Yes ☑ No
Modified natural waterway		☐ Yes ☐ No
Constructed channel		☐ Yes ☐ No

IV. SUSMP Pollutants of Concern Worksheet

This worksheet is used to identify potential pollutants of concern associated with land use and to propose Best Management Practices (BMPs) to reduce pollution of storm water. BMP means a device or program that improves storm water quality. BMPs that prevent storm water from becoming polluted are called source controls. BMPs that remove pollutants from storm water are called treatment controls.

Identify the proposed source and treatment controls intended to reduce pollutants to the maximum extent practicable. Alternatively, explain why the pollutant is not anticipated to be generated by the proposed project.

Check a box to indicate proposed land use.

Land Use	Potential Pollutants of Concern	Proposed BMPs
☐ Lawns, Landscaping and Parks	Sediment (coarse and fine), Nutrients (dissolved and particulate), Pesticide, Pathogens, Trash and Debris	
☑ Parking lot(s), Driveways	Sediment (fine), Metals (dissolved and particulate), Total Petroleum Hydrocarbons (TPH), Trash	**Vegetated Buffer Area**
☐ Road Improvements (e.g. left turn lane)	Sediment (coarse and fine), Metals (dissolved and particulate), TPH, Polynuclear Aromatic Hydrocarbons (PAHs), Trash and Debris	
☑ Commercial (e.g. wineries, office buildings)	Sediment (coarse and fine), Nutrients (dissolved and particulate), Pesticides	**Vegetated Buffer Area**
☐ Food-related Commercial (restaurants)	Pathogens, Oil and Grease, Trash	
☐ Animal-related Commercial (e.g. dog grooming, horse stables)	Pathogens	
☐ Auto-related Commercial (repair shops, dealerships)	Metals (dissolved and particulate), TPH, PAHs, Surfactants	
☐ Industrial (e.g. metal processing, manufacturing facilities)	Sediment (coarse and fine), Metals (dissolved and particulate), TPH, PAHs, Polychlorinated Biphenyls (PCBs), Ph, Surfactants	

I declare that to the best of my knowledge, the information presented herein is accurate and complete.

[2] "Directly Adjacent" (County of Sonoma) means within a parcel of land that includes or is contiguous with a Natural Waterway, Modified Natural Waterway, or Constructed Channel; and some portion of the proposed development on said parcel must be within 100 feet of the top of bank, and drainage from the proposed development must flow towards and enter a waterway or channel.

[3] "Natural Waterway" means any natural stream of water flowing in a definite course or channel and possessing a bed and banks. It is not necessary that the flow of water be continuous throughout the year. Natural waterways do not include artificially created channels for storm waters, such as street gutters, roadside ditches, and drainage facilities installed in connection with the development of property.

[4] "Modified Natural Waterway" means any natural waterway that has been modified while retaining significant riparian vegetation, fish, wildlife habitat, and/or scenic values. Modified natural waterways do not include artificially created channels for storm waters, such as street gutters, roadside ditches, and drainage facilities installed in connection with the development of property.

[5] "Constructed Channel" means all waterways that are not in closed conduits and do not meet the definition of a "Natural Waterway" or "Modified Natural Waterway". Constructed Channels also include landscaped constructed waterways. Constructed Channels do not include street gutters, roadside ditches, and drainage facilities installed in connection with the development of property.

Job Number: 13077

Dear Becky:

This letter is to transmit projected water use for the proposed Ramey Winery application, UPE14-0008. The proposed winery includes a production facility for 60,000 cases of wine, tasting rooms, marketing accommodations, and twenty two agricultural promotional events. The landscape architect has provided projections for water use associated with the proposed landscape and water demand for irrigation and frost protection for the vineyards.

Total annual water demand for the project is estimated to be 5,445,272 gallons or 16.7 acre-feet. The winery production wastewater will be recycled for irrigation purposes so the annual demand on the water wells would be reduced to 4,581,272 gallons or 14.06 acre-feet.

Please let us know if you have any questions regarding this information.

Ramey Winery Water Flow Calculations

Winery Production:

Annual water use:
60,000 case production x 2.4 gallons per case x 6 gal water use / gal wine = 864,000 gal

Peak daily use during crush:
60,000 x 2.4 x 1.5 / 60 day crush period = 3,600 gpd

Domestic Water:

Employees:
15 full time employees x 15 gal/day = 225 gallons per day x 250 days/yr = 56,250 gal
3 part time employees x 15 gal/day = 45 gallon per day x 150 days/yr = 6,750 gal
6 seasonal employees x 15 gal/day = 90 gallons per day x 40 days/yr = 3,600 gal

Tasting Room Visitors:
75 peak, 25 average; 25 x 2.5 gal x 365 = 22,813 gal

Event Visitors:
Industry Wide 2 days x 300 visitors x 2.4 gal = 1,500 gal
2 events of 300 visitors x 2.5 gal = 1,500 gal
5 events of 120 visitors x 2.5 gal = 1,500 gal
5 events of 60 visitors x 5 gal = 1,500 gal
10 winemaker lunch or dinner of 30 visitors x 10 (incl kitchen) = 3,000 gal

Marketing Accommodations:
2 rooms x 120 gal/rm x 24 days/yr = 5,760 gal

Total Domestic Water Demand: = 104,083 gal

TABLE III-B

WINERY WASTE - SUBSURFACE WASTE DISPOSAL SYSTEM DESIGN CRITERIA

This table describes design criteria for small to medium size wineries that will be using subsurface disposal for their liquid winery wastes. Other criteria must be used for the disposal of domestic liquid wastes at a winery. Large wineries (i.e. annual production of more than 100,000 gallons of wine) may also have different design criteria. Special equipment may alter flows but reductions must be completely documented with manufacturer's literature and other reference works.

DESIGN FLOWS

The normally accepted dosing flows are as follows:

1 case of wine = 2.4 gallons
1 ton of grapes = 175 gallons of wine
Peak wastewater flow = 1.5 gallons for each gallon of wine production
Length of crush season varies by winery production - see formulas below

The following formulas are used to calculate winery wastewater flows

WINERY SIZE	FORMULA
Up to 20,000 gallons per year	$\frac{\text{Annual production (gal) X 1.5}}{\text{30 day harvest period}}$
20,000 to 50,000 gallons per year	$\frac{\text{Annual production (gal) X 1.5}}{\text{45 day harvest period}}$
50,000 and above	$\frac{\text{Annual production (gal) X 1.5}}{\text{60 day harvest period}}$

While many facilities may vary considerably from these figures due to various production methods or technologies, these formulas have been found to be a workable tool for design purposes. The formulas may be used for conventional systems as well as nonstandard systems.

Ramey Winery Landscape

Irrigation needs

The attached chart addresses the irrigation needs for each variety of plant specified on the plans.

The estimate is based on established plants.

These numbers are an estimate formulated from the WUCOL's list, and takes into account the evaporation/transpiration rates for Healdsburg.

There are many variables which could alter the water needs;

Weather (rain, heat, winds)

Soil structure & amendments

Thickness of mulch

Gopher activity

Size of initial plant

Time of year planted

These plants are all considered drought tolerant (once established) and will be irrigated on a drip system.

Addendum to the Traffic Study for the Ramey Winery Project

Dear Mr. Ramey;

The collision analysis prepared in 2016 for the Ramey Winery Project and included in the "Traffic Study for the Ramey Winery Project" dated March 10, 2016, was updated to reflect more current data. It is noted that although the study was finalized in 2016, at the time the analysis was originally prepared in late 2013, the most current data available was for the period of July 1, 2006 through June 30, 2011. Further, the California Highway Patrol has improved their system so that crash data is generally available within just a few months, so this update reflects much more recent data.

Collision History

The collision history for the study area was updated to reflect the collision history for January 1, 2012, through December 31, 2016. Records available from the California Highway Patrol, as published in their Statewide Integrated Traffic Records System (SWITRS), indicate that there were two collisions on the study segment during the most recent five-year period for which data is available.

The segment of Westside Road within a half-mile of the project site had a calculated collision rate of 1.10 collisions per million vehicle miles (c/mvm). This was compared to the average collision rate for similar segments statewide, as indicated in *2013 Collision Data on California State Highways*, California Department of Transportation, which is 1.58 c/mvm. Since the collision rate was determined to be below average, and there were only two crashes reported during this time period, the segment appears to be operating within expected safety parameters. A copy of the collision rate calculations is enclosed.

Feel free to contact me if you have any questions or comments. Thank you for allowing us to provide these services.

Sincerely,

Dalene J. Whitlock

Healdsburg, CA 95448

Traffic Study for the Ramey Winery Project

Dear Mr. Ramey;

W-Trans has completed a focused traffic analysis addressing potential traffic impacts associated with a proposed winery project at 7097 Westside Road outside Healdsburg in the County of Sonoma. The project as proposed would include production of 60,000 cases of wine, a tasting room, retail sales and up to 24 agriculture promotion events annually. The site was previously occupied by Westside Farms.

Existing Conditions

The study area consisted of the section of Westside Road providing access to the project site. Westside Road is a two-lane rural roadway with a paved width of approximately 25 to 26 feet in the vicinity of the project site. It is marked with a double yellow centerline, and there is not a posted speed limit, though the curvilinear alignment keeps speeds lower than the *prima facie* 55 mph speed limit that would apply in the absence of a lower limit established by the County of Sonoma, though a speed survey performed at the driveway indicates that in the vicinity of the project site drivers are generally traveling about 30 to 35 mph. The current volume on Westside Road is about 3,000 ADT near Felta Road based on counts performed by the County in August 2012, but drops to about 1,050 vehicles per day near the project site based on counts obtained on July 16, 2013 specifically for this analysis. A count performed by the County in late July 2015 indicates that volumes have dropped 12 to 15 percent since 2012, though the higher 2012 volumes were used for analysis purposes. A copy of the traffic count taken near the site driveway is enclosed for reference along with the summary sheets of the County's counts.

Collision History

The collision history for the study area was reviewed to determine any trends or patterns that may indicate a safety issue. Collision rates were calculated based on records available from the California Highway Patrol as published in their Statewide Integrated Traffic Records System (SWITRS) reports. The most current five-year period available is July 1, 2006 through June 30, 2011.

One collision was reported on Westside Road during the study period within a half-mile of the project site. This translates to a calculated collision rate of 0.55 collisions per million vehicle miles (c/mvm). This was compared to the average collision rate for similar segments statewide, as indicated in *2009 Collision Data on California State Highways*, California Department of Transportation, which is 1.58 c/mvm. Since the collision rate was determined to be below average, and there was only one crash reported during this time period, the segment appears to be operating within expected safety parameters. A copy of the collision rate calculations is enclosed.

Roadway Segment Analysis

Level of Service Methodology

The roadway segment Level of Service methodology found in Chapter 15, "Two-Lane Highways," of the *Highway Capacity Manual* is the basis of the automobile LOS analysis. The methodology considers traffic volumes, terrain, roadway cross-section, the proportion of heavy vehicles, and the availability of passing zones. The LOS criteria for two-lane highways differs depending on whether the highway is considered "Class I", "Class II", or "Class III". Class I highways are typically long-distance routes connecting major traffic generators or national highway networks where motorists expect to travel at high speeds. Motorists do not necessarily expect to travel at high speeds on Class II highways, which often function as scenic or recreational routes and typically serve shorter trips. Class III highways may be portions of Class I or Class II highways that pass through towns and communities and have a mix of local traffic and through traffic. Westside Road is considered a Class II highway for the purpose of this analysis.

The measure of effectiveness by which Level of Service is determined on Class II highways is percent time spent following (PTSF), or the proportion of time that drivers on the highway are limited in their speed by a driver in front of them. A summary of the PTSF breakpoints is shown in Table 1.

Table 1 – Automobile Level of Service Criteria

LOS	**Class II Highways** **PTSF (%)**
A	≤40
B	>40-55
C	>55-70
D	>70-85
E	≤85

Notes: LOS = Level of Service; PTSF = Percent Time Spent Following
Reference: *Highway Capacity Manual*, Transportation Research Board, 2010

The Level of Service Standard for County roadway operations per Policy CT-4.1 is to maintain a Level of Service C.

Existing Roadway Segment Analysis

Under existing p.m. peak hour volumes, Westside Road is operating acceptably at LOS A or B. A summary of the roadway segment level of service calculations is shown in Table 2, and copies of the Level of Service calculations are enclosed.

Table 2 – Existing Peak Hour Roadway Segment Levels of Service

Westside Road	**Weekday PM Peak**	
	PTSF	**LOS**
Northbound	54.9	B
Southbound	39.7	A

Notes: PTSF = Percent Time Spent Following; LOS = Level of Service

Cumulative Conditions

Future traffic volumes were developed based on information produced by the County's traffic model, which is maintained by the Sonoma County Transportation Authority. The increment of new traffic projected by comparing the model's 2040 data with the 2010 data indicates only one to four percent growth total over the entire thirty years. Review of historical count data provided by the County shows that volumes increased by less than 2 percent for the nine-year period between 2006 and 2015 and less than 4 percent for the 13 years between 2002 and 2015. Substantial additional growth is not anticipated as there is not much opportunity for further development along the roadway.

Future Roadway Segment Analysis

Under the projected future volumes applied for the analysis, the roadway study segment is expected to continue operating acceptably at LOS C or better in both directions. These results are summarized in Table 3.

Table 3 – Cumulative Peak Hour Roadway Segment Levels of Service		
Westside Road	**Weekday PM Peak**	
	PTSF	**LOS**
Northbound	55.4	C
Southbound	40.2	B

Notes: PTSF = Percent Time Spent Following; LOS = Level of Service

Project Description

The proposed project includes activities spread among a number of buildings located on both sides of Westside Road. The production of wine would take place in buildings on the west side of the roadway, with access via an existing driveway serving a residence at that location. Only activities typically associated with production and sales of wine would occur at the winery and attached caves. Parking for production employees, sales staff, and commercial visitors would be provided at the winery building. The tasting room and spaces for agriculture promotion events would be located on the east side of the road. Parking for tasting room employees and visitors as well as event guests would be provided on the same site.

Trip Generation

For purposes of estimating the number of new trips that proposed projects can be expected to generate, *Trip Generation Manual*, 9th Edition, Institute of Transportation Engineers, 2012, is typically used. Since this publication does not contain information for wineries, Sonoma County's Winery Trip Generation form was used to determine the potential trip generation for the proposed project. A copy of the Winery Trip Generation form for the proposed project is enclosed.

It is anticipated that the proposed new winery including the tasting room would have a total of 15 employees, each generating an average of three trips per day. Truck traffic associated with winery operations is expected to consist of five trips per day, on average. An average of 52 visitors per day is expected for tasting, generating 42 trips daily assuming average vehicle occupancy of 2.5 visitors per vehicle. In order to determine the project trips generated during the p.m. peak hour, it was assumed that one trip would be generated for every employee and ten percent of the daily visitor trips would occur during the p.m. peak hour. For directionality split, two-thirds of the trips were assumed to be outbound since most of the trips would be associated with employees and customers leaving at closure of the winery. Truck trips typically occur during off-peak hours and were therefore not included in the p.m. peak hour. As shown in Table 4, the proposed project is expected to generate an average of 92 vehicle trips per day, including 19 during the p.m. peak hour.

Table 4 – Trip Generation Summary					
Trip Type	**Unit**	**Average Daily Trips**		**PM Peak Trips**	
		Rate	**Trips**	**In**	**Out**
Employees	12	3.0	36	4	8
Tasting Visitors	52	0.8	42	1	3
Tasting Room Employees	3	3.0	9	1	2
Trucks	n/a	n/a	5	n/a	n/a
Total			**92**	**6**	**13**

Trip Distribution

For the purpose of this analysis, it was conservatively assumed that all trips generated by the project would be going to and/or coming from Healdsburg to the North via Westside Road. It is, in fact, expected that trips to the site would be drawn fairly evenly from the north and south for daily operation, resulting in half as many trips being added as were assumed for analysis purposes.

Roadway Segment Operation

Existing plus Project

Under Existing plus Project volumes the study roadway is expected to operate acceptably in both directions. These results are summarized in Table 5.

Table 5– Existing plus Project Peak Hour Roadway Segment Levels of Service

Westside Road	Weekday PM Peak	
	PTSF	LOS
Northbound	56.4	C
Southbound	41.0	B

Notes: PTSF = Percent Time Spent Following; LOS = Level of Service

Cumulative plus Project

With project-generated traffic added to the anticipated Future volumes under the conservative assumption that all trips would come from the same direction, the study roadways are expected to continue operating acceptably at the same levels of service as without the project. The Cumulative plus Project operating conditions are summarized in Table 6.

Table 6 – Cumulative plus Project Peak Hour Roadway Segment Levels of Service

Westside Road	Weekday PM Peak	
	PTSF	LOS
Northbound	57.0	C
Southbound	41.3	B

Notes: PTSF = Percent Time Spent Following; LOS = Level of Service

Agriculture Promotional Events

The project application includes provisions for 24 agriculture promotional events per year, including 10 events with 30 persons in attendance, five 60-person catered events, five 120-person events and four 300-person outdoor events, two of which would be industry-wide events. It is assumed that a maximum-sized 300-person event would require a staff of 14. It is understood that the largest site-specific event would be scheduled to ensure that no more than 150 people are on-site at any one time, and attendance of an industry-wide event would be expected to spread out even more, resulting in fewer guests on-site at any given time. Using an occupancy of 2.5 guests per vehicle and solo occupancy for staff, a maximum sized event would be expected to generate 268 trip ends at the driveway, including 134 inbound trips and 134 outbound trips at the driveway, though these trips would be spread out such that no more than 60 trips in either direction would occur during a single hour, with staff arriving before and departing after the guests. The distribution of trips for special events is expected to be weighted more heavily to the south, with 75 percent of trips coming from/returning to this direction. A copy of the special event form is enclosed.

It should be noted that Westside Farms, the previous use of this site, held a harvest market each fall which included a pumpkin patch, hay rides, and sales of hand-crafted foods and gift items. This event, which lasted for approximately the month of October each year, drew up to 600 persons on a peak day. This prior use generated substantially more event traffic during the month of October than the currently proposed project will generate over the course of an entire year.

Sensitivity Analysis

Using the same roadway segment Level of Service methodology found in the *Highway Capacity Manual*, it was determined that 208 vehicle trips could be added in *each* direction on Westside Road before the northbound direction would experience unacceptable LOS D operation. Using 2.5 guests per vehicle, it is estimated that vehicles carrying more than 500 guests could arrive at winery agricultural promotional events during one hour and another 500 depart from the same or a different winery event, and operation would remain acceptable under the standards established by Sonoma County. This exceeds the size of the largest event proposed at this winery, but even with the 300-person event, and assuming that as many as 150 guests arrive or depart during a single hour from the same direction, the road would retain capacity for other events having a combined total of more than 350 guests.

Given that the site is more quickly accessed from the south for visitors coming from Santa Rosa and points south or from the north for visitors coming from Healdsburg and the surrounding valleys, it appears reasonable to expect that up to 75 percent of event traffic would come from the south. Assuming this split, the largest project event would generate 75 visitors arriving from the north, or 30 vehicles, leaving capacity for the cumulative demand associated with nearly 450 visitors arriving at and departing from other area wineries during the same, single hour. It is again emphasized that all of these trips would need to occur ***during a single hour*** for the cumulative impact to be experienced; if the trips are spread out over more than an hour's time, the cumulative effect is diluted. Based on this review it appears that there is adequate capacity for multiple events to generate trips simultaneously without having a significant negative impact on operation of Westside Road. However, to avoid the potential of multiple large events occurring simultaneously it would be desirable for vintners in the area to coordinate their event schedules, which we understand is being proposed.

Access and Circulation

Field conditions at the site driveway were field evaluated to determine adequacy of sight distance as well as to identify any potential for conflict between the opposing driveways for the winery site and tasting room site. The tasting room driveway is on the easterly side of the roadway, opposite and offset from the winery driveway. Conflicts with traffic to and from the opposing driveways are not expected.

Sight Distance

At driveways a substantially clear line of sight should be maintained between the driver of a vehicle waiting on the driveway and the driver of an approaching vehicle. Adequate time must be provided for the waiting vehicle to either turn left, or right, without requiring the through traffic to radically alter their speed. Sight distances along Westside Road from the existing driveway locations were evaluated based on sight distance criteria contained in *A Policy on Geometric Design on Highways and Streets* published by American Association of State Highway and Transportation Officials (AASHTO). These guidelines are based upon approach travel speeds, and take into account which direction a vehicle would turn onto the major approach, with greater sight distance needed for the more time-consuming task of turning left as compared to turning right. Although sight distance requirements are not technically applicable to driveways, the stopping sight distance criterion for private street intersections was applied for evaluation purposes.

The *prima facie* speed is 55 mph, but based on a radar speed survey performed at the driveway, the curves at either side of the site effectively reduce speeds to an average of 30 mph and 85th, or critical speed of 35 mph approaching the driveway. A copy of the speed survey is enclosed. The minimum stopping sight distance needed for an approach speed of 35 mph is 250 feet.

Sight distance was measured from a 3.5-foot height at the location of the driver on the minor road to a 4.25-foot object height in the center of the approaching lane of the major road. Sight lines were field measured from a point 15 feet back from the edge of pavement. The Westside Farms sign currently restricts sight lines toward the north from the tasting room driveway on the easterly side of the road. This sign will need to be removed to provide adequate sight line; once removed there will be more than 400 feet of sight distance to the north. To the south of the driveway there is more than 400 feet of sight distance, which is more than adequate for the speed of traffic.

While existing sight lines to the south are adequate for the winery driveway on the westerly side of Westside Road, the curve north of the driveway limits sight lines to less than the 250 feet recommended. However, as shown on the attached exhibit, measures are to be taken to remove and/or trim vegetation and shave back the hillside as necessary to achieve the 250 feet of sight distance needed for the critical approach speed.

It is noted that there is a mirror on the east side of the road that provides adequate visibility of oncoming traffic to drivers exiting the driveway. Mirrors are not typically recommended along public roadways, in part because the mirror would either need to be in the public right-of-way or on another person's property. In this case, the property on both sides of the road belongs to the same owner, so the mirror can be maintained on private property and outside the public right-of-way. Because the mirror may further extend sight lines beyond the minimum needed, it is suggested that the mirror be retained so that the infrequent vehicle traveling at higher speeds can be seen approaching from an adequate distance.

Pedestrian Access

Based on the project proposal it is anticipated that pedestrian trips between the winery and tasting room will be infrequent, and limited to employees. The operation as proposed is not expected to result in any need for guests to cross from one side of Westside Road to the other. Recommended sight lines are shown on the enclosed exhibit.

Turn Lane Warrants

The need for turn lanes on Westside Road was evaluated based on criteria contained in the *Intersection Channelization Design Guide*, National Cooperative Highway Research Program (NCHRP) Report No. 279, Transportation Research Board, 1985, as well as a more recent update of the methodology developed by the Washington State Department of Transportation. Traffic counts for both the a.m. and p.m. peak hours were used for the evaluation.

For this analysis it was conservatively assumed that all project related traffic would access the site via southbound left-turns as this condition represents the greatest potential need for a left-turn pocket. Although special events would not typically start during a peak hour, to evaluate worst case conditions, inbound trips to a time-specific event (one that would have its arriving traffic consolidated into a short time period) were used along with the higher peak hour volumes near Felta Road. Even using this conservative approach a left-turn lane is not warranted.

Based on the evaluation performed as well as the lack of left-turn pockets for any of the other wineries on Westside Road, a left-turn pocket is not recommended. A copy of the Turn Lane Warrant spreadsheet is enclosed.

Conclusions and Recommendations

- Based on the review and analysis performed, it is anticipated that the proposed project will have a limited impact on traffic operation along Westside Road, and will actually generate fewer special event trips that the previous use for Westside Farms.
- Westside Road is expected to operate acceptably under volumes including project-generated traffic and traffic associated with agriculture promotional events both in the short-term and long-range. Further, multiple events could occur simultaneously without triggering unacceptable operating conditions under the County's standards.

- Westside Road has experienced collisions at a rate below the statewide average, so exhibits an acceptable safety condition.

- Sight distance from the tasting room driveway on the east side of Westside Road is generally adequate, though the existing "Westside Farms" sign should be removed and this area left clear to provide acceptable sight distance to the north.

- Sight distance to the north from the winery driveway on the west side of the road is adequate to the south, but inadequate to the north. The proposed measures, including removing and/or trimming vegetation together with shaving back the hillside as necessary, should be implemented.

- Very little pedestrian traffic is expected between the winery and tasting room, and that will be limited to staff. However, should other pedestrian traffic be generated, sight lines will be adequate for such crossings upon implementation of the proposed measures noted above.

- A left-turn lane is neither warranted nor recommended on Westside Road at the project's driveways. We hope that the above information adequately addresses the proposed winery project's potential impacts.

Feel free to contact me if you have any questions or comments. Thank you for allowing us to provide these services.

SEGMENT COLLISION RATE CALCULATIONS

County of Sonoma

Location: Westside Road

Date of Count: Tuesday, July 16, 2013
ADT: 1,000

Number of Collisions: 1
Number of Injuries: 0
Number of Fatalities: 0
Start Date: July 1, 2006
End Date: June 30, 2011
Number of Years: 5

Highway Type: Conventional 2 lanes or less
Area: Rural
Design Speed: <=55
Terrain: Rolling/Mountain

Segment Length: 1.0 miles
Direction: North/South

$$\frac{\text{Number of Collisions x 1 Million}}{\text{ADT x 365 Days per Year x Segment Length x Number of Years}}$$

$$\frac{1 \times 1{,}000{,}000}{1{,}000 \times 365 \times 1 \times 5}$$

	Collision Rate	Fatality Rate	Injury Rate
Study Segment	0.55 c/mvm	0.0%	0.0%
Statewide Average*	1.58 c/mvm	2.4%	43.6%

ADT = average daily traffic volume
c/mvm = collisions per million vehicle miles
* 2009 Collision Data on California State Highways, Caltrans

Bicycle LOS                                               D

Notes:
1. Note that the adjustment factor for level terrain is 1.00, as level terrain
   is one of the base conditions. For the purpose of grade adjustment, specific
   dewngrade segments are treated as level terrain.
2. If vi (vd or vo ) >= 1,700 pc/h, terminate analysis-the LOS is F.
3. For the analysis direction only and for v>200 veh/h.
4. For the analysis direction only.
5. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a
   specific downgrade.

Bicycle LOS                                                   D

Notes:
1. Note that the adjustment factor for level terrain is 1.00, as level terrain
   is one of the base conditions. For the purpose of grade adjustment, specific
   dewngrade segments are treated as level terrain.
2. If vi (vd or vo ) >= 1,700 pc/h, terminate analysis-the LOS is F.
3. For the analysis direction only and for v>200 veh/h.
4. For the analysis direction only.
5. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a
   specific downgrade.

Mr. David Ramey
Ramey Vineyards LLC
P.O. Box 788
Healdsburg, CA 95448

Traffic Study for the Ramey Winery Project

Dear Mr. Ramey;

Whitlock & Weinberger Transportation, Inc. (W-Trans) has completed a focused traffic analysis addressing potential traffic impacts associated with a proposed winery project at 7097 Westside Road outside Healdsburg in the County of Sonoma. The project as proposed would include production of 60,000 cases of wine, a tasting room, retail sales and up to 24 special events annually. The site was previously occupied by Westside Farms.

Existing Conditions

The study area consisted of the section of Westside Road providing access to the project site. Westside Road is a two-lane rural roadway with a paved width of approximately 25 to 26 feet in the vicinity of the project site. It is marked with a double yellow centerline, and there is not a posted speed limit, though the curvilinear alignment keeps speeds lower than the *prima facie* 55 mph speed limit that would apply in the absence of a lower limit established by the County of Sonoma, though a speed survey performed at the driveway indicates that in the vicinity of the project site drivers are generally traveling about 30 to 35 mph. The current volume on Westside Road is about 3,000 ADT near Felta Road based on counts performed by the County in August 2012, but drops to about 1,050 vehicles per day near the project site based on counts obtained on July 16, 2013 specifically for this analysis. A copy of the traffic count taken near the site driveway is enclosed for reference.

Collision History

The collision history for the study area was reviewed to determine any trends or patterns that may indicate a safety issue. Collision rates were calculated based on records available from the California Highway Patrol as published in their Statewide Integrated Traffic Records System (SWITRS) reports. The most current five-year period available is July 1, 2006 through June 30, 2011.

One collision was reported on Westside Road during the study period within a half-mile of the project site. This translates to a calculated collision rate of 0.55 collisions per million vehicle miles (c/mvm). This was compared to the average collision rate for similar segments statewide, as indicated in *2009 Collision Data on California State Highways*, California Department of Transportation, which is 1.58 c/mvm. Since the collision rate was determined to be below average, and there was only one crash reported during this time period, the segment appears to be operating within expected safety parameters. A copy of the collision rate calculations is enclosed.

Project Description

The proposed project includes activities spread among a number of buildings located on both sides of Westside Road. The production of wine would take place in buildings on the west side of the roadway, with access via an existing driveway serving a residence at that location. Only activities typically associated with production and sales of wine would occur at the winery and attached caves. Parking for production employees, sales staff, and commercial visitors would be provided at the winery building. The tasting room and spaces for marketing events would be located on the east side of the road. Parking for tasting room employees and visitors as well as event guests would be provided on the same site.

Trip Generation

For purposes of estimating the number of new trips that proposed projects can be expected to generate, *Trip Generation Manual*, 9th Edition, Institute of Transportation Engineers, 2012, is typically used. Since this publication does not contain information for wineries, Sonoma County's Winery Trip Generation form was used to determine the potential trip generation for the proposed project. A copy of the Winery Trip Generation form for the proposed project is enclosed.

It is anticipated that the proposed new winery including the tasting room would have a total of 15 employees, each generating an average of three trips per day. Truck traffic associated with winery operations is expected to consist of five trips per day, on average. An average of 52 visitors per day is expected for tasting, generating 42 trips daily assuming average vehicle occupancy of 2.5 visitors per vehicle. As shown in Table 1, the proposed project is expected to generate an average of 92 vehicle trips per day.

Table 1
Trip Generation Summary

Trip Type	**Average Daily Trips**		
	Unit	**Rate**	**Trips**
Employees	12	3.0	36
Tasting Visitors	52	0.8	42
Tasting Room Employees	3	3.0	9
Trucks	n/a	n/a	5
Total			**92**

<u>Special Events</u>

The project application includes provisions for 24 special events per year, including 10 events with 30 persons in attendance, five 60-person catered events, five 120-person events and four 300-person outdoor events, two of which would be industry-wide. It is assumed that a maximum sized 300-person event would require a staff of 14. Using an occupancy of 2.5 vehicles per guests and solo occupancy for staff, a maximum sized event would be expected to generate 254 trip ends at the driveway, including 127 inbound trips at the start of the event and 127 outbound trips upon its conclusion. Copies of the special event forms are enclosed.

It should be noted that Westside Farms, the previous use of this site, held a harvest market each fall which included a pumpkin patch, hay rides, and sales of hand-crafted foods and gift items. This event, which lasted for approximately the month of October each year, drew up to 600 persons on a peak day. This prior use generated substantially more event traffic during the month of October than the currently proposed project will generate over the course of an entire year.

Access and Circulation

Field conditions at the site driveway were field evaluated to determine adequacy of sight distance as well as to identify any potential for conflict between the opposing driveways for the winery site and tasting room site. The tasting room driveway is on the easterly side of the roadway, opposite and offset from the winery driveway. Conflicts with traffic to and from the opposing driveways are not expected.

Sight Distance

At driveways a substantially clear line of sight should be maintained between the driver of a vehicle waiting on the driveway and the driver of an approaching vehicle. Adequate time must be provided for the waiting vehicle to either turn left, or right, without requiring the through traffic to radically alter their speed. Sight distances along Westside Road from the existing driveway locations were evaluated based on sight distance criteria contained in *A Policy on Geometric Design on Highways and Streets* published by American Association of State Highway and Transportation Officials (AASHTO). These guidelines are based upon approach travel speeds, and take into account which direction a vehicle would turn onto the major approach, with greater sight distance needed for the more time-consuming task of turning left as compared to turning right. Although sight distance requirements are not technically applicable to driveways, the stopping sight distance criterion for private street intersections was applied for evaluation purposes.

The prima facie speed is 55 mph, but based on a radar speed survey performed at the driveway, the curves at either side of the site effectively reduce speeds to an average of 30 mph and 85th, or critical speed of 35 mph approaching the driveway. A copy of the speed survey is enclosed. The minimum stopping sight distance needed for an approach speed of 35 mph is 250 feet.

Sight distance was measured from a 3.5-foot height at the location of the driver on the minor road to a 4.25-foot object height in the center of the approaching lane of the major road. Sight lines were field measured from a point 15 feet back from the edge of pavement. The Westside Farms sign currently restricts sight lines toward the north from the tasting room driveway on the easterly side of the road. This sign will need to be removed to provide adequate sight line; once removed there will be more than 400 feet of sight distance to the north. To the south of the driveway there is more than 400 feet of sight distance, which is more than adequate for the speed of traffic.

While existing sight lines to the south are adequate for the winery driveway on the westerly side of Westside Road, the curve north of the driveway limits sight lines to less than the 250 feet recommended. However, as shown on the attached exhibit, measures are to be taken to remove and/or trim vegetation and shave back the hillside as necessary to achieve the 250 feet of sight distance needed for the critical approach speed.

It is noted that there is a mirror on the east side of the road that provides adequate visibility of oncoming traffic to drivers exiting the driveway. Mirrors are not typically recommended along public roadways, in part because the mirror would either need to be in the public right-of-way or on another person's property. In this case, the property on both sides of the road belongs to the same owner, so the mirror can be maintained on private property and outside the public right-of-way. Because the mirror may further extend sight lines beyond the minimum needed, it is suggested that the mirror be retained so that the infrequent vehicle traveling at higher speeds can be seen approaching from an adequate distance.

Pedestrian Access

Based on the project proposal it is anticipated that pedestrian trips between the winery and tasting room will be infrequent, and limited to employees. The operation as proposed is not expected to result in any need for guests to cross from one side of Westside Road to the other. Recommended sight lines are shown on the enclosed exhibit.

Turn Lane Warrants

The need for turn lanes on Westside Road was evaluated based on criteria contained in the *Intersection Channelization Design Guide*, National Cooperative Highway Research Program (NCHRP) Report No. 279, Transportation Research Board, 1985, as well as a more recent update of the methodology developed by the Washington State Department of Transportation. Traffic counts for both the a.m. and p.m. peak hours were used for the evaluation.

For this analysis it was conservatively assumed that all project related traffic would access the site via southbound left turns as this condition represents the greatest potential need for a left-turn pocket. Although special events would not typically start during a peak hour, to evaluate worst case conditions, inbound trips to a time-specific event (one that would have its arriving traffic consolidated into a short time period) were used along with the higher peak hour volumes near Felta Road. Even using this conservative approach a left-turn lane is not warranted.

Based on the evaluation performed as well as the lack of left-turn pockets for any of the other wineries on Westside Road, a left-turn pocket is not recommended. A copy of the Turn Lane Warrant spreadsheet is enclosed.

Conclusions and Recommendations

- Based on the review and analysis performed, it is anticipated that the proposed project will have a limited impact on traffic operation along Westside Road, and will actually generate fewer special event trips that the previous use for Westside Farms.
- Westside Road has experienced collisions at a rate below the statewide average, so exhibits an acceptable safety condition.
- Sight distance from the tasting room driveway on the east side of Westside Road is generally adequate, though the existing "Westside Farms" sign should be removed and this area left clear to provide acceptable sight distance to the north.
- Sight distance to the north from the winery driveway on the west side of the road is adequate to the south, but inadequate to the north. The proposed measures, including removing and/or trimming vegetation together with shaving back the hillside as necessary, should be implemented.
- Very little pedestrian traffic is expected between the winery and tasting room, and that will be limited to staff. However, should other pedestrian traffic be generated, sight lines will be adequate for such crossings upon implementation of the proposed measures noted above.

- A left-turn lane is neither warranted nor recommended on Westside Road at the project's driveways.

We hope that the above information adequately addresses the proposed winery project's potential impacts. Feel free to contact me if you have any questions or comments. Thank you for allowing us to provide these services.

Sincerely,

SUMMARY

The Ramey Winery proposed Westside Road Winery and Tasting Room Project, located at 7097 Westside Road, Healdsburg, CA, includes a new winery and wine caves, re-purpose existing 1949 hop kiln into a tasting room, re-furbish 1949 baling barn into marketing center, provide additional driveways and parking areas and enlarge existing driveways to meet Sonoma County Fire Safe Standards, as depicted on the Construction Drawings (Adobe Associates 2014).

Of the 75 acre parcel, approximately 42 acres are currently planted grapes. Of the remaining 33 acres, 3.47 acres (150,942 sq. ft.) are proposed for development.

This Habitat and Site Assessment presents the findings of our literature review (including scientific literature and previous reports detailing studies conducted in the area) and the California Department of Fish and Wildlife's (CDFW) Natural Diversity Data Base (CNDDB) for reported occurrences of special-status vegetation communities, plants and animals.

Three vegetation community types occur within the project area: *Quercus agrifolia* woodland alliance or coast live oak woodland; ruderal non-native grassland; and landscaped areas. The majority of the parcel consists of existing vineyards adjacent to the project area, but they are not part of the proposed project development, nor if the grove of Northern California black walnut (*Juglans hindsii*), which islocated in the eastern part of the property near the Russian River. No development is proposed for the black walnut grove other than placement of some picnic tables which would not impact the trees or the non-native grassland understory. A pond located on the west side is within the property boundary but will not be impacted or developed. The pond does support some willow (*Salix* spp.), and other riparian vegetation.

As part of this Habitat Assessment, we also evaluated the potential for occurrence of 58 special-status plant species, and 26 special-status wildlife species. Surveys for special status plants were conducted on April 28 and May 12, 2014 which covered the flowering period for all of the special status plants that have the potential to occur within the project area based on the presence of potential habitat.

Based on this review and limitations of the present surveys, the following are action items to be addressed prior to ground breaking:

- A certified arborist should conduct a tree inventory that would be used for the tree removal permit from the County and also to provide protection measures for existing native trees adjacent to any development. A tree planting plan may also be required to compensate for the loss of native trees.
- Removal of trees that may support potentially roosting bat species must occur under direct supervision of a bat biologist and occur between March 1 and April 15, or September 1 through October 15.
- Nesting bird survey within one week of the removal of nesting habitat, unless removal occurs after August 15 and before March 1

INTRODUCTION

Mr. David Ramey of Ramey Wine Cellars, contracted with Jane Valerius Environmental Consulting and Wildlife Research Associates to conduct a Habitat Assessment of the 75-acre parcel for their proposed 3.47-acre development. The 7079 Westside Road parcel (APN: 110-240-031 & 040) is located in the western portion of the Dry Creek Valley, in the central portion of Sonoma County, California. This habitat assessment was conducted to determine the potential for special-status vegetation communities, plant and animal species to occur within the proposed project and to identify the limitations to potential development of the project, such as: a) increased on-site flows from impermeable surfaces and, b) habitat removal.

This Habitat Assessment is part of the preliminary analysis of both the existing environment and potential impacts from the proposed project as required under the California Environmental Quality Act (CEQA) for new projects. Federal and state agencies that have purview over biological resources include the following:

- U.S. Army Corps of Engineers (USACE),
- U.S. Fish and Wildlife Service (USFWS),
- National Marine Fisheries Service (NMFS),
- California Regional Water Quality Control Board (RWQCB), and the
- California Department of Fish and Wildlife (CDFW).

The USACE regulates the discharge of dredged or fill material into waters of the United States. Waters of the U.S. are defined as waters that are hydrologically connected to waters with interstate or foreign commerce, and includes tributaries to any of these waters, and wetlands, which are areas that are inundated or saturated by surface water or groundwater at a frequency and duration sufficient to support vegetation typically adapted to life in saturated soil conditions. The USFWS has regulatory authority over federally listed plant and animal species. The NMFS, a division of the National Oceanic and Atmospheric Administration (NOAA), has regulatory authority over essential fish habitat, which is habitat necessary to maintain sustainable fisheries in the United States. The California RWQCB protects all waters with special responsibility for wetlands, riparian areas, and headwaters. The CDFW has regulatory authority over state listed plants and animals as well as streams and lakes within the State.

Locally, Sonoma County has regulatory authority over: a) large native trees, trees with historical importance, and oak woodland habitat, under the Sonoma County Native Tree Protection and Preservation Ordinance, and b) all natural watercourses shown as a solid or dashed blue lines, or along watercourses supporting riparian vegetation, under the Biotic Resource Areas identified in the County General Plan (Sonoma County 2008). See Appendix A for more regulatory details.

Site Location

The proposed project site is located in central portion of Sonoma County, within the Dry Creek Valley, located southwest of the City of Healdsburg, west of the Russian River and west of the River Front Regional Park. The project site lies on either side of Westside Road, located north of the confluence of Russian River and Porter Creek (Figure 1).

Proposed Project

The proposed project involves development on the east and west side of Westside Road and is a follows.

West Side: The proposed project is to construct a 60,000-case winery comprised of caves (11,000 to 15, 000 sq. ft.) and in front of the caves, a cut and fill, low profile, 19,100 sq. ft. two story wine building which will not be visible from Westside Road. The existing barn will be refurbished. Access roads and associated parking will also be added to parcel.

East Side: The proposed project is to refurbish an existing 1949 hop kiln barn into a public tasting room, leaving the exterior similar to its currently appearance while maintaining the furnace and ductwork in the

south side. The three story baling barn will be refurbished as a marketing reception area, with equipment storage on the ground level, a kitchen and meeting area for marketing purposes on the mid-level and 2 bedrooms as marketing accommodations on the top level, with two work stations. The two barns will be connected by an elevated walkway. The bailing barn will be refurbished to maintain its current outward appearance. Access roads and associated parking will also be added to parcel.

Table 1: Square footage of structures – 7097 Westside Road

	Square Footage	
Structure	**Existing Surface**	**New Surface**
Entrance Roadway (west)	7,938 (gravel)	
Roadway to winery and parking (west)		37,090
Winery Building (west)		19,100
Wine caves (west)		20,720
Entrance roadway (east)	14,785 (gravel)	7,414
Parking and building access (east)		54,653

CL II AB		39,800
Concrete		2,233
Hop kiln (2 structures)	2,947	2,947
Baling barn	2,245	2,2455
Concrete walkways		2,233
Total	27,819	**150,942**

METHODS

Information on special-status plant species was compiled through a review of the literature and database search. Database searches for known occurrences of special-status species focused on the Healdsburg, Guerneville, Camp Meeker and Sebastopol U.S. Geologic Service 7.5-minute topographic quadrangles, which provided a three mile radius around the proposed project area. The following sources were reviewed to determine which special-status plant and wildlife species have been documented in the vicinity of the project site:

- U.S. Fish and Wildlife Service (USFWS) quadrangle species lists (USFWS 2014)
- USFWS list of special-status animals for Sonoma County (USFWS 2014)
- California Natural Diversity Database records (CNDDB) (CDFW 2014)
- California Department of Fish and Wildlife's (CDFW) Special Animals List (CDFW 2014)
- State and Federally Listed Endangered and Threatened Animals of California (CDFW 2014).
- California Native Plant Society (CNPS) Electronic Inventory records (CNPS 2014)
- California Department of Fish and Game (CDFG) publication "California's Wildlife, Volumes I-III" (Zeiner, et al., 1990)
- Sonoma County General Plan 2020, Open Space and Resource Conservation Element (Sonoma County 2008)

Botanical nomenclature used in this report conforms to Baldwin, et al. (2012) for plants and to Sawyer et al. (2009) for vegetation communities. Nomenclature for special-status animal species conforms to CDFW (2013).

Site Survey: Jane Valerius of Jane Valerius Environmental Consulting, and Trish Tatarian, Wildlife Research Associates, conducted a reconnaissance-level wildlife survey and a survey for special status plants of proposed project areas on April 28, 2014, between the hours of 1000 and 1300. Greg Tatarian, Wildlife Research Associates, also conducted a site visit on April 28. An additional site survey to review trees and also conduct special status plant surveys was conducted by Jane Valerius and Trish Tatarian on May 12, 2014.

Plant Surveys: Special status plant surveys were conducted for the development area on April 28 and May 12, 2014. The area to be developed was walked and a list of all plants identifiable at the time of the surveys was recorded (Appendix D). The timing of the surveys was planned to coincide with the flowering period for all of the special status plants that had the potential to occur within the development area based on the presence of potential habitat.

Wildlife Surveys: Exterior surfaces and grounds, and interiors surfaces and spaces of all buildings on the east side proposed for removal and/or refurbishment were surveyed signs of past or present use by bats, including; fecal pellet accumulations, urine staining, fur staining on entry points, live or dead bats, audible calls, and characteristic odor. Surveys were conducted using 10 x 42 roof-prism binoculars supplemented as needed with a 295 Lumens flashlight and an approximately 3,000 Lumens spotlight. All interior building spaces were examined, including the attic spaces.

All trees were assessed for suitable potential habitat for colonial bat species, consisting of cavities, crevices and exfoliating bark. Additionally, foliage habitat suitable for use by obligate tree-roosting, solitary bat species was also assessed. The assessment was conducted using 10 x 42 roof-prism binoculars, with a 295-Lumen flashlight for illuminating potential roost features from the ground. Presence/absence surveys were not conducted

The project area was evaluated for suitable bird nesting habitat using 8 x 42 roof-prism binoculars, noting presence of old bird nests. The reconnaissance-level site visit was intended only as an evaluation of on-site and adjacent habitat types; no special-status species surveys were conducted as part of this effort as winter is not a time of year in which surveys for nesting birds are valid.

EXISTING CONDITIONS

The project area is located within the San Francisco Bay Coastal Bioregion (Welsh 1994). This bioregion is located within central California and encompasses the San Francisco Bay and the Sacramento Delta, extending from the Pacific Ocean to the eastern portion of the tule marsh zone, which is defined by Highway 99 (Welsh 1994). Habitats within this bioregion include both mesic (moist) habitats, such as freshwater marsh, and xeric (dry) habitats, such as chaparral, and are typical of a Mediterranean type climate.

The proposed project site is located within the central western portion of the Healdsburg topographic quadrangle. The parcel lies in southeastern corner of Section 21, on the west side of the Russian River and north of Porter Creek. At this location of the Russian River, the watershed is defined by a western ridge, created by Denner Ridge (600 feet in elevation).

Topographically, the western project site is located on a gently sloping hill that slopes to the east, while the eastern portion of the parcel is within the flatlands of the Russian River.

Of the 75-acre parcel, 42-acres are currently planted in grapes on the east side with a bailing barn, two hop kilns, a small winery residence and small pump house.

On the west side of the road, the parcel comprises 6.5 acres and currently contains a residence, a barn, an open hay and tractor shed, and a 3.5-acre foot reservoir.

Vegetation Communities

Three vegetation community types occur within the project area: *Quercus agrifolia* woodland alliance or coast live oak woodland; ruderal non-native grassland and landscaped areas. There are also existing vineyards adjacent to the project area but they are not part of the proposed project development. There is also a grove of Northern California black walnut (*Juglans hindsii*) in the eastern part of the property near the Russian River. No development is proposed for the black walnut grove other than placement of some picnic tables which would not impact the trees or the non-native grassland understory. A pond located on the west side is within the property boundary but will not be impacted or developed. The pond does support some willow (*Salix* spp.), and other riparian vegetation. The pond was not surveyed as part of the plant surveys.

Quercus agrifolia woodland alliance or cost live oak woodland: Located on the east side, adjacent to Westside Road, is a remnant stand of oak woodland, from what was probably the native vegetation prior to development of the area (Fig. 2). The dominant tree species is coast live oak and includes some valley oak (*Quercus lobata*), black oak (*Quercus kelloggi*), California buckeye (*Aesculus californica*) and California bay laurel (*Umbellularia californica*). A common understory shrub species in this type is poison oak (*Toxicodendron diversilobum*). Understory herbs include miner's lettuce (*Claytonia perfoliata*) and California poppy (*Eschscholzia californica*). Coast live oak woodland occurs in small patches within and adjacent to the property. This type also provides canopy cover for two natural drainages on the east side of the project area. Other than individual oak trees to be removed within the rudral non-native grassland type, the remnant oak woodland stands will not be impacted by the project.

Ruderal grassland: Ruderal grassland is comprised of a variety on non-native grasses and forbs with no one species being dominant. Plant species this type include non-native grasses such as ripgut brome (*Bromus diandrus*), soft chess (*Bromus hordaeceus*), wild oats (*Avena barbata*), European hair grass (*Aira caryophyllea*), ryegrass (*Festuca perennis*), Harding grass (*Phalaris aquatica*), hare barley (*Hordeum murinum* ssp. *leporinum*) and rattail fescue (*Festuca myuros*) along with non-native forb species such as filarees (*Erodium cicutarium, E. botrys*), mayweed (*Anthemis cotula*), scarlet pimpernel (*Anagallis arvensis*), mayweed (*Anthemis cotula*), bindweed (*Convolvulus arvensis*), rough cat's-ear (*Hypochaeris radicata*), mallow (*Malva* sp.), English plantain (*Plantago lanceolata*), mustard (*Brassica nigra, B. rapa*), and wild radish (*Raphanus sativus*). Within the ruderal grassland are several native tree species including coast live oak (*Quercus agrifolia*), valley oak (*Quercus lobata*) and cottonwood (*Populus fremontii*) (Fig. 3).

Landscaped areas: Landscaped areas include the landscaped yard around the existing residence and buildings. Plant species associated with this type include garden herbs such as sweet allysum (*Lobularia maritima*) and garden iris (*Iris* sp.), garden shrubs such as roses (*Rosa* spp.) along with planted landscape trees such as red oak (*Quercus rubra*), Italian alder (*Alnus cordata*), honey locust (*Gleditsia triacanthos*), fig (*Ficus* sp.), apple (*Malus* sp. and various fruit trees (*Prunus* spp.) as well as native coast redwood (*Sequoia sempervirens*).

Northern California black walnut. A grove of Northern California black walnut trees is located outside of the project area adjacent to the Russian River on the east side of the property. Northern California black walnut (*Juglans hindsii*) is a CNPS Rank 1B species. However, only those trees which are considered truly endemic or native are given a special status. The CNPS Inventory of Rare and Endangered Plants, 8th Edition, provides the following information:

> *Only one confirmed, native occurrence appears viable as of 2003. Widely naturalized in cismontane CA. Threatened by hybridization with orchard trees, urbanization, and conversion to agriculture. Formerly cultivated as rootstock for J. regia, with which it hybridizes readily* (CNPS 2014).

Fig. 2: Coast live oak woodland on east side of Ramey Vineyard.

Fig. 3: Non-native grassland on west side.

Although the grove of walnut trees may be significant it is likely that they are not truly endemic or native which means that they do not qualify as special status. The only plans for this area are to place some picnic tables which would only be used seasonally. The proposed uses, as described by Mr. David Ramey, owner, would not have an adverse impact upon this grove.

Individual Trees. A total of 21 trees are proposed to be removed as part of the project. Several trees are ornamental, including Italian alder (*Alnus cordata*), red oak (*Quercus rubra*), and fruit trees (*Prunus* sp., *Malus* sp.). The majority of trees are native trees and are valley oak (*Quercus lobata*), coast live oak (*Quercus agrifolia*) or cottonwoods (*Populus fremontii*), although the latter were planted as a screen. The coast redwood (*Sequoia sempervirens*) tree is native although it was planted as part of the landscaping for the residence. A total of 6 coast live oak trees, 5 valley oak trees, 4 cottonwood trees and 1 redwood tree would be removed for a total of 15 native trees. The remaining trees are non-native species. A formal tree survey has not been conducted by a certified arborist. The diameter at breast height (dbh) of the trees as shown on the plan maps was also consistently one to two inches smaller than what was measured in April and May 2014. A tree inventory should be conducted by a certified arborist prior to construction of the proposed project.

Table 2: Trees identified for removal, with Diameter at Breast Height (dbh)

	Tree Species	Dbh (inches)*	Location
1	Ornamental	10 + 6	East
2	Italian alder	15	East
3	Italian alder	10	East
4	Coast live oak	11+8+14	West
5	Coast live oak	11+15	West
6	Red oak	21	West
7	Coast redwood	26	West
8	Fruit trees	16	West
9	Valley oak	18	West
10	Valley oak	18	West
11	cottonwood	14	West
12	cottonwood	19	West
13	cottonwood	14	West
14	cottonwood	15	West
15	Coast live oak	7	West
16	Valley oak	7	West
17	Valley oak	42	West
18	Coast live oak	13+6	West
19	Coast live oak	15+12	West
20	Valley oak	9	West
21	Coast live oak	13+11	West

*Note: dbh depicted on the June 19, 2014 Site Plan is likely from 2013. Field surveys conducted in 2014 found 1 inch of growth difference.

Wetlands and Waters of the U.S. and State: There are two natural drainages on the east side of Westside Road. These drainages do not show up as blue line drainages on the USGS quadrangle and do not occur on the west side of the road or property. One drainage is located between the two existing hop kilns and is fed by the roadside ditch that runs along the west side of Westside Rd (see Site Plan). The other natural drainage is south of the proposed barn or south the south hop kiln. A drainage ditch runs along the west side of the existing access road just east of the hop kilns and an agricultural ditch runs along the west side of the existing vineyard east of the hop kilns and buildings. The agricultural ditch is located east of the proposed overflow parking area, between the proposed parking area and existing vineyard. The agricultural ditch supports wetland vegetation and was wet at the time of the May 12, 2014 site visit. Wetland vegetation in the agricultural ditch included meadow barley (*Hordeum brachyantherum*), water plaintain (*Alisma trivale*), umbrella sedge (*Cyperus eragrostis*) and ryegrass (*Festuca perennis*).

All of the drainages and ditches within the project area and on the property potentially qualify as waters of the U.S. as defined by the U.S. Army Corps of Engineers (Corps) and all of these features definitely qualify as waters of the state as defined by the Regional Water Quality Control Board (RWQCB). The natural drainages would also likely fall within the jurisdiction of the California Department of Fish and Wildlife (CDFW), however the roadside and agricultural ditches would probably not fall under CDFW jurisdiction.

A formal delineation of wetlands and waters of the U.S. and state was not conducted for the site as part of this habitat assessment. However, the project has been designed to avoid any impacts to the existing drainages in the project area, therefore a delineation is not required and no permits will be needed from the U. S. Army Corps of Engineers or Regional Water Quality Control Board for placement of fill into wetlands or water.

Wildlife Habitats

The value of a site to wildlife is influenced by a combination of the physical and biological features of the immediate environment. Species diversity is a function of diversity of abiotic and biotic conditions and is greatly affected by human use of the land. The wildlife habitat quality of an area, therefore, is ultimately determined by the type, size, and diversity of vegetation communities present and their degree of disturbance. Wildlife habitats are typically distinguished by vegetation type, with varying combinations of plant species providing different resources for use by wildlife. The following is a discussion of the wildlife species supported by the on-site habitats, as described by *A Guide to Wildlife Habitats of California* (Mayer and Laudenslayer 1988).

Non-native Annual Grassland: Typically this type of habitat provides both primary habitat, such as nesting and foraging, and secondary habitat, such as a movement corridor. Small species using this habitat as primary habitat include reptiles and amphibians, such as southern alligator lizard (*Gerrhonotus multicarinatus*), western fence lizard (*Sceloporus occidentalis*), and Pacific slender salamander (*Batrachoseps attenuatus*), which feed on invertebrates found within and beneath vegetation and boulders within the vegetation community. This habitat also attracts seed-eating and insect-eating species of birds and mammals. California quail (*Lophortyx californicus*), mourning dove (*Zenaidura macroura*), and meadowlark (*Sturnella neglecta*) are a few seed-eaters that nest and forage in grasslands. The close proximity to anthropogenic structures and domestic pets negates the potential for the on-site habitat to support nesting birds.

Individual Trees. Individual trees are foraging and nesting habitat for passerines, and roosting habitat for bats. Smaller passerines, such as black-capped chickadee (*Poecile atricapillus*), bushtit (*Psaltriparus minimus*), plain titmouse (*Baeolophus inornatus*) and acorn woodpecker (*Melanerpes formicivorus*) may nest and forage in the larger trees, feeding on insects on the bark. No large cavities that may support the larger raptors, such as great horned owl (*Bubo virginianus*), were observed in any of the trees. Cavities in the oak trees may provide potential nesting habitat for tree swallows (*Tachycineta bicolor*) and white-breasted nuthatch (*Sitta carolinensis*). Of the 21 trees surveyed, only one had potentially suitable roosting habitat for bats. This tree is located on the west side and is the valley oak with a 42 dbh (Fig. 4).

Bats that use trees fall into three categories: 1) solitary, obligate tree-roosting bats that roost in the foliage or bark such as Western red-bat (*Lasiurus blossevillii*), a California Species of Special Concern (SSC), or hoary bat (*Lasiurus cinereus*); 2) colonial tree-roosting bats that form groups of varying size in tree cavities or beneath exfoliating bark, such as silver-haired bats (*Lasionycteris noctivagans*), and 3) more versatile bat species that will use a wide variety of roosts from buildings to bridges to trees, such as various *Myotis* species, pallid bat (*Antrozous pallidus*), another SSC species, and others.

Solitary-roosting bats consist either of females either alone or with young, or solitary males. Colonial-roosting bats may form maternity colonies in tree cavities or crevices, caves, mines, bridges, or other man-made structures. During the day, these roosts provide shelter and protection for adult females and their young, which remain in the roost while females forage at night, returning to nurse and care for their young. Greater impacts to bats can occur as a result of removal of trees that support cavity-roosting bat species than those that provide habitat for solitary foliage-roosting species.

Buildings: Six structures were evaluated for this Habitat Assessment, the large barn, the wood-sided southern hop barn, wood-sided northern hop barn, wood-sided small farmhouse (residence), metal-sided chicken building, and wood-sided pump storage barn. As stated above, many colonial bat species have adapted to using man-made structures such as houses, barns, sheds, garages, bridges, and culverts. Statewide and in the project region, buildings provide significant roosting habitat for bat species, including more common species such as Brazilian free-tailed bat (*Tadarida brasiliensis*) and Yuma myotis (*Myotis yumanensis*), as well as more rare species such as pallid bat (*Antrozous pallidus*), a California Species of Special Concern (SSC) and Townsend's big-eared bat (*Corynorhinus townsendii*), proposed for listing as Endangered by the CDFW. Please see Special Status Species Section for more details on *C. townsendii*.

In general, day roost habitat is considered more critical than night roost habitat, because it provides shelter for bats from light, air currents, predators, and other disturbance, and are where bats mate, raise young, roost during dispersal, and overwinter, either in torpor or hibernation. Because of this, and because demolition typically occurs during daytime hours, the risks of direct mortality of bats is very high at day roosts. Although night roosts are also very important for bats for various purposes (conservation of energy during foraging bouts, social interaction, etc.), buildings are not usually demolished at night, so although the habitat is lost, direct mortality does not usually occur.

Montane hardwood: This wildlife habitat type includes Coast live oak woodland. The woodlands provide habitat for a variety of species, including refugia for reptiles, such as ring-necked snake (*Diadophis punctatus*), amphibians, such as the Pacific slender salamander (*Batrachoseps attenuatus*) and arboreal salamander (*Aneides lugubris*), foraging and nesting habitat for passerines, and roosting habitat for bats. Smaller passerines, such as black-capped chickadee (*Poecile atricapillus*), bushtit (*Psaltriparus minimus*), oak titmouse (*Baeolophus inornatus*) and downy woodpecker (*Picoides pubescens*) observed on the site may nest and forage in the woodlands, feeding on insects on the bark.

Perennial Pond: Although outside the proposed project footprint, this pond is within 120 feet of the proposed driveway. Species observed in the pond include non-native mosquitofish (*Gambusia affinis*), and eastern bullfrog (*Lithobates catesbeianus*). A daytime survey of the pond revealed 52 adult bullfrogs and a high population of tadpoles. Native species observed were Sierran treefrogs (*Pseudacris sierra*) (Fig. 5).

Fig. 4: Oak trees on the west side of the proposed project area.

Fig. 5: Perennial pond located outside the project area.

Movement Corridors

Wildlife movement includes migration (i.e., usually one way per season), inter-population movement (i.e., long-term genetic flow) and small travel pathways (i.e., daily movement corridors within an animal's territory). While small travel pathways usually facilitate movement for daily home range activities such as foraging or escape from predators, they also provide connection between outlying populations and the main corridor, permitting an increase in gene flow among populations.

These linkages among habitat types can extend for miles between primary habitat areas and occur on a large scale throughout California. Habitat linkages facilitate movement among populations located in discrete areas and populations located within larger habitat areas. The mosaic of habitats found within a large-scale landscape results in wildlife populations that consist of discrete sub-populations comprising a large single population, which is often referred to as a meta-population. Even where patches of pristine habitat are fragmented, such as occurs with coastal scrub, the movement between wildlife populations is facilitated through habitat linkages, migration corridors and movement corridors. Depending on the condition of the corridor, genetic flow between populations may be high in frequency, thus allowing high genetic diversity within the population, or may be low in frequency. Potentially low frequency genetic flow may lead to complete isolation, and if pressures are strong, potential extinction (McCullough 1996; Whittaker 1998).

Wildlife connectivity of this site to other open lands in the area can occur through the vineyards and undeveloped lands. There are no barriers to movement between the pond on the site and ponds located further west. Westside Road is likely not a barrier to movement based on the rate of traffic after the wineries and tasting rooms have closed their doors. As a result, animals are likely able to move across the road at dusk and night without the mortality from traffic.

SPECIAL-STATUS BIOLOGICAL RESOURCES

Certain vegetation communities, and plant and animal species are designated as having special-status based on their overall rarity, endangerment, restricted distribution, and/or unique habitat requirements. In general, special-status is a combination of these factors that leads to the designation of a species as sensitive. The Federal Endangered Species Act (FESA) outlines the procedures whereby species are listed as endangered or threatened and established a program for the conservation of such species and the habitats in which they occur. The California Endangered Species Act (CESA) amends the California Fish and Wildlife Code to protect species deemed to be locally endangered and essentially expands the number of species protected under the FESA.

Special-status Vegetation Communities

Sensitive natural communities are those that are considered rare in the region, may support special-status plant or wildlife species, or may receive regulatory protection (i.e., through Section 404 of the Clean Water Act [CWA] and/or Sections 1600 et seq. of the California Fish and Wildlife Code). Please refer to Appendix A for detailed descriptions of waters and wetlands. In addition, sensitive natural communities include plant communities that have been identified as having highest inventory priority in the California Natural Diversity Database (CNDDB). The second edition of *A Manual of California Vegetation* (Sawyer, et al. 2009) also provides the rarity ranking status of these communities. No sensitive natural communities occur within the proposed project area. The Northern California black walnut grove, located on the eastern side of the property, is not considered to be a native occurrence. As a result, it does not qualify as a special-status vegetation community nor are the individual trees considered to be special status. However, no work is proposed in this area and the grove will be preserved.

Special-status Plant Species

Special-status plant species are those species that are legally protected under the federal Endangered Species Act (ESA) and/or the California Endangered Species Act (CESA) as listed or proposed for listing as threatened or endangered, as well as species that are considered rare by the scientific community. For example, the California Native Plant Society (CNPS) has identified some species as List 1 or 2 species and may be considered rare or endangered pursuant to Section 15380(b) of the State CEQA Guidelines. The CDFW has compiled a list of "Special Plants" (CDFW 2014), which include California Special Concern species. These designations are given to those plant species whose vegetation communities are seriously threatened. Although these species may be abundant elsewhere they are considered to be at some risk of extinction in California. Although Special Concern species are afforded no official legal status under FESA or CESA, they may receive special consideration during the planning stages of certain development projects and adverse impacts may be deemed significant under the California Environmental Quality Act (CEQA).

A total of 58 special-status plant species have been reported occurring on the four topographic quadrangles (CNDDB 2014). Please refer to Appendix B for a list of these species and their potential for occurrence. Those species that occur in freshwater marshes and swamps, riparian scrub, broadleafed upland forest, chaparral, cismontane woodland, closed-cone coniferous forest, vernal pools, bogs and fens, coastal scrub, meadows and seeps, North Coast coniferous forest, coastal prairie, coastal bluff scrub or plants that occur on serpentinite or other substrates not occurring within the project area were considered to not have the potential to occur. Species associated with valley and foothill grassland could potentially occur on the site but not of these species were observed during the appropriately timed special status plant surveys in April and May. The property on the east side was a pumpkin patch and farm store starting in 1989 and then became vineyards. The property on the west side has been a residence with landscaped yard and garden. The grassland communities in the project area are highly disturbed and dominated by weedy, non-native species. No special-status plants are likely to occur within the proposed project area and none were observed.

Special-status Animal Species

Special-status animal species include those listed by the USFWS (2013) and the CDFW (2013). The USFWS officially lists species as either Threatened or Endangered, and as candidates for listing. Additional species receive federal protection under the Bald Eagle Protection Act *(e.g.*, bald eagle, golden eagle), the Migratory Bird Treaty Act (MBTA), and state protection under CEQA Section 15380(d). In addition, many other species are considered by the CDFW to be species of special concern; these are listed in Remsen (1978), Williams (1986), and Jennings and Hayes (1994). Although such species are afforded no official legal status, they may receive special consideration during the planning and CEQA review stages of certain development projects. The CDFW further classifies some species under the following categories: "fully protected", "protected fur-bearer", "protected amphibian", and "protected reptile". The designation "protected" indicates that a species may not be taken or possessed except under special permit from the CDFW; "fully protected" indicates that a species can be taken for scientific purposes by permit only.

Of the 20 special-status animal species identified as potentially occurring in the vicinity of the project area, including within a 3 mile radius (CNDDB 2014), several additional species were evaluated for their potential to occur within the study area, based on: 1) review of the CNDDB, 2) the "Special Animals" list (CDFW 2014) that includes those wildlife species whose breeding populations are in serious decline, and 3) the habitat present on site. See Appendix C for a list of the 26 species evaluated. Several of these species have a high potential for occurrence at the project site and are discussed below. This document does not address impacts to species that may occur in the region but for which no habitat occurs on site.

California red-legged frog (*Rana draytonii*) (CRF), listed by the USFWS as Threatened and is classified by the CDFW as a California Special Concern species and a Fully Protected Species under Fish and Game Code 5050, breeds primarily in ponds, but will also breed in slow-moving streams, or deep pools in intermittent streams. Inhabited ponds are typically permanent, at least 2 feet (0.6 meters) in depth, and contain emergent and shoreline vegetation. Sufficient pond depth and shoreline cover are both critical, because they provide means of escape from predators and high winter flooding of stream habitat for the frogs (Stebbins 1985, Tatarian 2008).

Project Area Occurrence: No surveys were conducted for this species as part of this habitat assessment. The pond structure and hydrology provides suitable breeding habitat for this species. However, the presence of adult bullfrogs, the high population (52 adults and thousands of tadpoles) reduces the suitability of the pond.

Laboratory experiments have clarified the effects bullfrogs and mosquitofish have on CRF (Lawler, *et al.* 1999). Under natural conditions, the presence of bullfrog tadpoles nearly precluded the recruitment of CRF tadpoles to the juvenile stage. Mosquitofish, however, with a variety of prey items and spatially complex escape areas available, do not affect the recruitment of CRF tadpoles. However, in those ponds with both species occurring in high numbers, such as the pond on-site, the potential for CRF to occur is low to none. The effects of introduced predators on the survival of CRFs are largely related to the relative population sizes of the predators, the quality and amount of aquatic habitat, and the CRF. Specifically, CRFs and introduced predators can coexist if the number of predators remains small compared to the number of CRFs and habitats provide refugia for CRF from excessive predation. No CRF were detected during the daytime survey. A nocturnal survey would provide the best way of determining presence. The high population of bullfrogs likely precludes CRFs at this pond. As a result, this species has a low potential for occurrence in this portion of Dry Creek Valley and the pond on-site. The nearest reported presence occurrs more than 3 miles west of the project area in Austin Creek (CNDDB 2014).

Foothill yellow-legged frog (*Rana boylii*) is a California Special Concern species, and occurs in most Pacific drainages from Oregon to Los Angeles County. The species typically inhabits perennial rocky streams, preferring streams with cobble-sized substrates (Jennings and Hayes 1994). Occupied drainages range from sea level to 2,040 meters (6,700 feet) (Jennings and Hayes 1994). Streams in woodland, chaparral or forest with little-to-no bank vegetation cover are also preferred (Stebbins 1985). Breeding occurs from mid-March to May, depending on rains, with tadpoles metamorphosing in June or July.

Project Area Occurrence: No surveys were conducted for this species as part of this habitat assessment. This species is not expected to occur in the pond. This species has been reported occurring approximately 1.2 miles west of the project area in Porter Creek (CNDDB 2014).

Western pond turtle (*Emys marmorata*) is listed by the CDFW as a California Special Concern species. It originally inhabited many of the pacific drainage basins in California (Stebbins 1985). This medium sized turtle ranges in size to just over 8 inches (21cm) with a low carapace that is generally olive, brownish or blackish (Stebbins 1985, Jennings and Hayes 1994). Primary habitats include permanent water sources such as ponds, streams and rivers. It is often seen basking on logs, mud banks or mats of vegetation, although wild populations are wary and individuals will often plunge for cover after detecting movement from a considerable distance. Although it is an aquatic species with webbed feet, it can move across land in response to fluctuating water level, an apparent adaptation to the variable rainfall and unpredictable flows that occur in many coastal California drainage basins (Rathbun, *et al.* 1992).

Project Area Occurrence: No surveys were conducted for this species as part of this habitat assessment. This species is expected to occur within the pond on-site. This species has been reported occurring less than 1 mile east of the project area in the Russian River (CNDDB 2014).

Nesting Passerines: As stated previously, passerines, protected under the MBTA and Fish and Wildlife Code 3503, have potential to nest within the proposed project area. Bird species potentially nesting in the riparian area include tree swallows (*Tachycineta bicolor*), bushtit (*Psaltriparus minimus*) and oak titmouse (*Baeolophus inornatus*) that glean insects from the bark. As early as February, passerines begin courtship and once paired, they begin nest building, often around the beginning of March. Nest structures vary in shapes, sizes and composition and can include stick nests, mud nests, matted reeds and cavity nests. For example, black phoebes may build a stick nest under the eaves of a building. Depending on environmental conditions, young birds may fledge from the nest as early as May and, if the prey base is large, the adults may lay a second clutch of eggs.

Project Area Occurrence: No surveys were conducted for these species as part of this habitat assessment. Several passerine (perching birds) species may nest on the site in the various habitats, including, but not limited to, white-breasted nuthatch in the oak trees. A nesting bird survey shall be conducted before removal of any of these habitats, and seasonal restrictions put into place for occupied habitats, to ensure no take of individuals will occur.

Nesting Raptors: As with passerines, raptors (birds of prey), such as red-shouldered hawk (*Buteo lineatus*), cooper's hawk (*Accipiter cooperii*), are protected under the Federal Migratory Bird Treaty Act and Fish and Wildlife Code 3503.5

General Ecology and Distribution: Raptors nest in a variety of substrates including, cavities, ledges and stick nests. For example, Cooper's hawks are small bird hunters, hunting on the edges of forests in broken forest and grassland habitats where passerines forage for seeds and insects. Nests occur in heavily forested areas near a water source. Research sites on nesting Cooper's hawks rarely show the nests more than a quarter of a mile away from water, whether it is a cattle tank, stream or seep (Snyder and Snyder 1975). Trees typically used by Cooper's hawks include coast live oaks, cottonwoods, and black oaks (Call 1978), as well as second growth conifer stands or deciduous riparian areas. In general, the breeding season for raptors occurs in late March through June, depending on the climate, with young fledging by early August.

Project Area Occurrence: No surveys were conducted for these species as part of this habitat assessment. No nests were detected at the time of the survey. However, nest structures could be developed before the project goes to construction and the trees are removed.

Roosting bats – including Townsend's big-eared bat[1] (*Corynorhinus townsendii*), pallid bat[2] (*Antrozous pallidus*), western red bat (*Lasiurus blossevillii*) and hoary bat[2] (*Lasiurus cinereus*).

Status: [1]Proposed for listing as Endangered or Threatened by CDFW, [2]State Species of Concern (SSC), as well as Fish and Wildlife Code Sections 86, 2000, 2014, 3007, Title 14, Sections 15380, 15382.

General Ecology and Distribution: Bats in this region of California are not active year-round. During the maternity season, non-volant young of colonial bats remain in the roost until late summer (end of August), after which they may disperse from the natal roost or remain into or throughout the winter. Obligate tree-roosting bat species, and to some extent, colonial bats, may switch tree roosts frequently, particularly after young are volant, but are sometimes faithful for longer periods (weeks). During winter months, bats typically enter torpor, rousing only occasionally to drink water or opportunistically feed on insects. The onset of torpor is dependent upon environmental conditions, primarily temperature and rainfall. To prevent direct mortality of either non-volant young or torpid bats during winter months, roosts must not be disturbed or destroyed until bats are seasonally active, and only after they have been provide a means of escape from the roost.

Townsend's big-eared bats have been proposed for listing as either Endangered or Threatened by the California Fish and Wildlife Commission. During the one-year public comment and review process, the species receives the same protections as a fully listed species.

Townsend's big-eared bats are found unevenly throughout most of the state from sea level to the Sierras, but are more restricted in their roost habitat selection, and more sensitive to human disturbance. This species is more strongly associated with cave and mine habitat, preferring large, open roosts, compared to smaller cavities or crevices. In addition to cave and mine roosts, this species uses buildings, bridges and culverts, and there is some evidence that very large redwood tree basal hollows have been used. Roosts for this nomadic species may serve multiple functions throughout the year, and multiple sites may be used for different life stages (pregnancy, parturition, rearing, etc.). Males remain solitary during maternity season.

Pallid bats, an SSC species, are eclectic in their roosting habitat selection, and to some extent distribution, and can be found in crevices and small cavities in rock outcrops, tree hollows, mines, caves, and a wide variety of man-made structures such as buildings, bridges and culverts, generally in lower to mid-elevation sites. This species forms maternity colonies, composed of dozens to sometimes hundreds of females and their young, and smaller bachelor colonies composed of males and not-yet reproductive females.

Western red bats, an SSC species, have a broad, but disjunct, distribution throughout the state, and a wide range of elevations. Reproductive females are more common in the inland portions of the state than the Bay Area, where males are more common during the summer months. This is a foliage-roosting species typically associated with large-leaf trees, such as willows, cottonwoods, and sycamores, and is often found near riparian zones. Western red bats are typically solitary, however females give birth to two to five young, which is atypical compared to other bat species.

Project Area Occurrence: Buildings: Pallid bats and Townsend's big-eared bats have potential to roost in the structures located on the project site. Two non-SSC bat species, Yuma Myotis (*Myotis yumanensis*) and Brazilian free-tailed bats (*Tadarida braziliensis*) were found in several of the on-site buildings during the 2014 season (See Table 3).

Table 3: Structures Proposed for Renovation and their Potential Suitability for Roosting Bats

Structure	Site Location	Type of Roost	Signs Observed
Large baling barn	East (southern portion)	Maternity Day Roost – loft and lower floor Night Roost – loft and lower floor	Large amounts of fecal pellets widely distributed throughout lower floor areas, lower floor loft, and loft above. Large numbers (ca. 200) *Myotis yumanensis* roosting in frame gaps of wood hop cars and ca. 50 *Tadarida brasiliensis* at roof ridge beams. Appears to be a long-term maternity day roost.
Hop Barn (southern)	East (central portion)	Day Roost, possibly maternity – roof rafters and skip-sheathing gaps Night Roost – open areas in upper and lower floors	No bats observed during assessment, but small crevices could hid bat, probably *Myotis yumanensis* or other small *Myotis* species. Moderate amounts of bat fecal pellets on loft floor and lower floor ground.
Hop Barn (northern)	East (central portion)	Day Roost, possibly maternity – roof rafters and skip-sheathing gaps Night Roost – open areas in upper and lower floors	No bats observed during assessment, but small crevices could hid bat, probably *Myotis yumanensis* or other small *Myotis* species. Moderate amounts of bat fecal pellets on loft floor and lower floor ground.
Small farm house	East (central portion)	Maternity Day Roost – roof soffit, rafters Night Roost – while raising pups	Observed ca. 10 *Myotis yumanensis* roosting in enclosed soffit, more likely present but not visible.
Chicken shed	East (south portion)	None	None
Pump storage barn	East (central portion)	None	None

Large Barn: The large barn, constructed of wood with horizontal siding boards and corrugated metal roof, is in poor condition with many exterior siding boards missing or peeling away, providing many suitable entry points and roost areas. The structure contained extensive evidence of both day and night roosting activity in the lower floor. Bats have been roosting from floor joists, ceiling fixtures, wall joists, gaps in header beams, and other locations throughout. Most of the evidence in the lower floor appears to be the result of night-roosting activity, however the second floor and upper floor loft area contain evidence of day-roosting activity, and approximately 200 Yuma myotis (*Myotis yumanensis*) were observed roosting in crevices in the frames of the hop cars located on rails in the loft, and ca. 50 Brazilian free-tailed bats (*Tadarida brasiliensis*) were observed roosting in the gap between the paired ridge beams of the roof, beneath the corrugated metal roofing material. This building provides maternity day roost habitat, and likely has done so for many years, based on extensive fecal and urine staining evidence throughout. Several photos are included in this report showing this roosting activity. There were additional cavities between exterior wall siding and interior wood panels that could provide roost habitat, but were not able to be surveyed at the time of our assessment.

Though not SSC species, large colonies of Brazilian free-tailed or Yuma myotis often occupy a roost, and significant impact to local breeding populations could occur if buildings are demolished without first conducting humane bat eviction or other appropriate measures.

Hop Barns: Both of these wood-sided/shingle-roof structures are in poor condition, with the south barn roof almost entirely missing, and exterior siding peeling and missing. Both structures contain suitable day and/or night roost habitat to varying degrees. Evidence of use by Brazilian free-tailed bats (*Tadarida brasiliensis*) and Yuma myotis (*Myotis yumanensis*) was present in the upper floor areas on the slotted flooring, walls, and gaps between skip-sheathing and roofing materials. In addition, a wad of cloth sacks was suspended from the roof rafters in the south barn, and a metal pulley hanging from the wall of the north barn both provided roost habitat for bats, based on fecal accumulations below. The lower floors, mostly open, could provide suitable night roost habitat, but appear too cold and damp for day roost activity.

Small Farm House (Residence): This wood-sided, single-story residence with attached shed roofs and patios has finished interior ceilings, and enclosed soffits at the gable ends. The building is in good condition, however, there are numerous potential openings into wall and roof sections. Approximately 10 *Myotis yumanensis* were observed inside the soffit cavity, and evidence of long-term use was observed. This structure is providing maternity day roost habitat, as well as night roost habitat for nursing female bats.

Chicken Shed: This corrugated metal-sided building with wood framing is too open to provide suitable roost habitat, other than for occasional, individual bats. No evidence of past or present roosting activity was observed.

Pump/Storage Barn: No evidence of past or present roosting activity was observed, however this building could provide habitat for day or night roosting bats if left undisturbed (the building is currently actively used for storage), and/or during bat exclusion/eviction from the barn structures.

Please refer to the Impacts and Mitigation Measures for details on avoidance measures of roosting bats in buildings on this site.

<u>Trees</u>: One valley oak tree on the western portion of the project site contained suitable potential cavity and crevice roost habitat. SSC bat species such as pallid bats, as well as non-SSC species have potential to roost in cavities and exfoliating bark observed in this tree.

Other larger mature trees throughout the project site proposed for removal may also support non-SSC bats such as western red bat (Lasiurus blossevillii), as well as hoary bats (*Lasiurus cinereus*), both obligate tree-roosting solitary bat species.

Please refer to the Impacts and Mitigation Measures for details on avoidance measures of roosting bats in trees on this site.

IMPACTS AND MITIGATION MEASURES

This section summarizes the potential temporary biological impacts from construction activities within the study area. The analysis of these impacts is based on a single reconnaissance-level survey of the study area, a review of existing databases and literature, and personal professional experience with biological resources of the region.

CEQA Guidelines Sections 15206 and 15380 were used to determine impact significance. Impacts are generally considered less than significant if the habitats and species affected are common and widespread in the region and the state.

A species may be treated as rare or endangered even if it has not been listed under CESA or FESA. Species are designated endangered when it survival and reproduction in the wild are in immediate jeopardy from one or more causes, including loss of habitat, change in habitat, overexploitation, disease or other factors.

For the purposes of this report, three principal components in the evaluation were considered:

- Magnitude of the impact (e.g., substantial/not substantial)
- Uniqueness of the affected resource (rarity)
- Susceptibility of the affected resource to disturbance (sensitivity)

The evaluation of significance must consider the interrelationship of these three components. For example, a relatively small-magnitude impact (e.g., disturbing a nest) to a state or federally listed species would be considered significant because the species is at low population levels and is presumed to be susceptible to disturbance. Conversely, a common habitat such as non-native grassland is not necessarily rare or sensitive to disturbance. Therefore, a much larger magnitude of impact (e.g., removal of extensive vegetation) would be required for it to be considered a significant impact.

Trees

Impacts: A total of 21 trees are proposed for removal as part of the proposed project. This includes 6 coast live oaks, 5 valley oaks, 4 cottonwoods and one redwood, all of which are native trees. The Sonoma County Tree Protection Ordinance General Provisions state:

> *Projects shall be designed to minimize the destruction of protected trees. With development permits, a site plan shall be submitted that depicts the location of all protected trees greater than nine inches (9") and their protected perimeters in areas that will be impacted by the proposed development, such as the building envelopes, access roads, leachfields, etc.*

Protected trees are defined as:

> *"Protected tree" means* Big Leaf Maple *Acer macrophyllum,* Black Oak *Quercus Kelloggii,* Blue Oak *Quercus Douglassi,* Coast Live Oak *Quercus agrifolia,* Interior Live Oak *Quercus Wislizenii,* Madrone *Arbutus Menziesii,* Oracle Oak *Quercus morehus,* Oregon Oak *Quercus Garryana,* Redwood *Sequoia sempervirens,* Valley Oak *Quercus lobata,* California Bay *Umbellularia California, and their hybrids.*
>
> *"Protected tree of special significance" means Quercus lobata* Valley Oak.

The Tree Protection Ordinance also states:

> *The Valley Oak-Quercus lobata shall receive special consideration in the design review process to the extent that mature specimens shall be retained to the fullest extent feasible. Valley Oaks contribute greatly to Sonoma County's visual character, landscape and they provide important visual relief in urban settings. On existing parcels created without the benefit of an accompanying*

> *EIR, design review shall focus on the preservation of Valley Oaks to the fullest extent feasible. Where such preservation would render a lot unbuildable, partial protection with accompanying appropriate mitigations developed by a certified arborist shall be incorporated into the project design. In such cases where only partial protection can be achieved, full replacement in accordance with the arboreal value chart shall be required.*

Mitigation Measure: The project will comply with the County's Tree Protection Ordinance. Compensation for the loss of native trees is provided in the ordinance and is based on arboreal values. The ordinance requires one hundred percent (100%) replacement of trees or payment of in-lieu fees. It is recommended that a certified arborist conduct a tree survey and inventory as part of the analysis of impacts for the project.

The County ordinance also requires that:

> *Before the start of any clearing, excavation, construction or other work on the site, every tree designated for protection on the approved site plan shall be clearly delineated with a substantial barrier (steel posts and barbed wire or chain link fencing) at the protected perimeter, or limits established during the permit process. The delineation markers shall remain in place for the duration of all work. All trees to be removed shall be clearly marked. A scheme shall be established for the removal and disposal of brush, earth and other debris as to avoid injury to any protected tree.*
>
> *Where proposed development or other site work must encroach upon the protected perimeter of a protected tree, special measures shall be incorporated to allow the roots to obtain oxygen, water and nutrients. Tree wells or other techniques may be used where advisable. No changes in existing ground level shall occur within the protected perimeter unless a drainage and aeration scheme approved by a certified arborist is utilized. No burning or use of equipment with an open flame shall occur near or within the protected perimeter (except for authorized controlled burns).*
>
> *No storage or dumping of oil, gasoline, chemicals or other substances that may be harmful to trees shall occur within the drip line of any tree, or any other location on the site from which such substances might enter the drip line.*
>
> *If any damage to a protected tree should occur during or as a result of work on the site, the County shall be promptly notified of such damage. If a protected tree is damaged so that it cannot be preserved in a healthy state, the planning director shall require replacement in accordance with the arboreal value chart. If on-site replacement is not feasible, the applicant shall pay the in-lieu fee to the tree replacement fund.*
>
> *The following design standards for protected trees shall be adhered to:*
>
> *Underground trenching for utilities should avoid tree roots within the protected perimeter. If avoidance is impractical, tunnels should be made below major roots. If tunnels are impractical and cutting roots is required, it shall be done by hand-sawn cuts after hand digging trenches. Trenches should be consolidated to serve as many units as possible.*
>
> *Compaction within the drip line or protected perimeter shall be avoided.*
>
> *Paving with either concrete or asphalt over the protected perimeter should be avoided. If paving over the protected perimeter cannot be avoided, affected trees shall be treated as removed for purposes of calculating arboreal values.*
>
> *Wherever possible, septic systems and/or leachlines shall not be located on the uphill side of a protected tree.*

> *Security posted for the purpose of insuring the proper construction of public or private improvements shall also include an amount sufficient to secure any requirements imposed pursuant to this section. In addition, security for potential tree damage shall be twenty-five percent (25%) of the amount posted for planned tree replacement. In lieu fees shall be paid prior to recording any maps. Such security shall not be released until protection requirements, including planting replacement trees, and any long term maintenance requirements have been satisfactorily discharged. The initial bond amount may be reduced to cover only the maintenance and replacement of trees after construction is completed.*

Birds

Impact: Several passerine (perching birds) species observed on site, such as California towhee and scrub jays, build stick nests in trees and shrubs, while others, such as the white-breasted nuthatch and chestnut-backed chickadee, nest in tree cavities. Disturbance during the nesting season (February 15- August 15) may result in the potential nest abandonment and mortality of young, which is considered a "take" of an individual. However, many of the species observed on the site were fledged juveniles from this year, which means that the nesting season has concluded in the project area.

Mitigation Measure: The following mitigation measures should be followed in order to avoid or minimize impacts to passerines and raptors that may potentially nest in the trees:

1) Grading or removal of nesting trees should be conducted outside the nesting season, which occurs between approximately February 15 and August 15.
2) If grading between August 15 and February 15 is infeasible and groundbreaking must occur within the nesting season, a pre-construction nesting bird (both passerine and raptor) survey of the grasslands and adjacent trees shall be performed by a qualified biologist within 7 days of ground breaking. If no nesting birds are observed no further action is required and grading shall occur within one week of the survey to prevent "take" of individual birds that could begin nesting after the survey.
3) If active bird nests (either passerine and/or raptor) are observed during the pre-construction survey, a disturbance-free buffer zone shall be established around the nest tree(s) until the young have fledged, as determined by a qualified biologist.
4) The radius of the required buffer zone can vary depending on the species, (i.e., 75-100 feet for passerines and 200-300 feet for raptors), with the dimensions of any required buffer zones to be determined by a qualified biologist in consultation with CDFW.
5) To delineate the buffer zone around a nesting tree, orange construction fencing shall be placed at the specified radius from the base of the tree within which no machinery or workers shall intrude.
6) After the fencing is in place there will be no restrictions on grading or construction activities outside the prescribed buffer zones.

Mammals

Impact: Renovation of buildings may cause direct mortality of roosting bats that use the structures, if the structures are removed during seasonal periods of inactivity (maternity season or winter), or without first conducting humane bat eviction or partial dismantling under supervision of a qualified bat biologist experienced with bats using man-made roosts.

Preventing Take of Bats in Buildings – General Discussion

In the case of buildings to be demolished for redevelopment, there are only two effective methods for getting bats out of the structure. The first, utilized mainly when the building is in good condition or will not be demolished, and the work is feasible, is "humane eviction", or "bat exclusion", which relies on the bats' ability to fly out of the roost. In this method, all potential, but currently unused entry points into the structure are sealed. The active entry points are fitted with one-way exits, which are left in place 7-10 days to allow all bats to emerge normally during nightly feeding flights. The one-way exits are then removed and the remaining openings sealed until demolition if it will occur more than 30 days after demolition. If the interval between successful eviction and demolition will be short (less than 4 weeks), the one-way exits may often be left in place until demolition. This work must be conducted by, or under direct supervision or instruction by a bat biologist qualified in humane bat eviction methods and materials.

In some cases, the physical condition of the structure is so poor that humane eviction as described above is not possible. If that occurs, the building must be carefully, and selectively dismantled in such a way that the internal environment is altered to a degree sufficient to cause bats to abandon the roost and not return. This must occur under the guidance bat biologist qualified in partial dismantling of structures for bat eviction.

In general, humane eviction of bats must occur during seasonal periods of bat activity, ***between March 1, or when evening temperatures are above 45F and rainfall less than ½" in 24 hours occurs, and April 15, prior to parturition of pups. The next acceptable period for humane eviction with suitable roosting habitat is after pups become self-sufficiently volant – September 1 through about October 15, or prior to evening temperatures dropping below 45F and onset of rainfall fretter than ½" in 24 hours.***

Mitigation Measures: To prevent direct mortality of bats that may roost in the structures on site, the following measures are recommended:

Large Barn: Under direct supervision of a qualified bat biologist, and only during seasonal periods of bat activity (see below for dates), conduct partial dismantling of portions of exterior siding and roofing material to increase light and airflow into structure. This will cause bats to abandon the structure if the building is made effectively unsuitable for continued roosting activity. All walls will require some removal of siding material to accomplish this, but the upper loft will also require supplemental lights aimed up from the floor directly beneath the hop cars to cause bats to abandon the roost crevices.

We recommend the use of exterior, PAR-style LED lights in suitable fixtures; these will provide bright light without heat and be economical to operate. It may require 7-10 days of this treatment to cause all bats to abandon the structure prior to construction activities, which must either occur within 48 hours of these actions, or the building must be sealed using polyethylene sheeting, leaving no available gaps. All measures must be implemented only during seasonal periods of bat activity to prevent direct mortality of non-volant young or overwintering adults and juveniles.

South Hop Barn: Under direct supervision of a qualified bat biologist, and only during seasonal periods of bat activity (see below for dates), conduct partial dismantling of portions of exterior siding and roofing material to increase light and airflow into structure, causing bats to abandon the structure of their own volition. All walls will require some removal of siding material to accomplish this.

North Hop Barn: Under direct supervision of a qualified bat biologist, and only during seasonal periods of bat activity (see below for dates), conduct partial dismantling of portions of exterior siding and roofing material to increase light and airflow into structure, causing bats to abandon the structure of their own volition. All walls will require some removal of siding material to accomplish this.

Residence: Under direct supervision of a qualified bat biologist, and only during seasonal periods of bat activity (see below for dates), conduct partial dismantling of portions of exterior siding and roofing material to increase light and airflow into structure, causing bats to abandon the structure of their own volition. All walls and portions of the soffit boards will require some removal of material to accomplish this.

Chicken Shed: No further actions are required to prevent use by bats or take of roosting bats.

Pump/Storage Barn: To reduce the likelihood of this building being used by bats abandoning the larger structures, all doors should be left open during day and night hours. No further actions are required.

Acceptable periods for partial dismantling are:

1. ***Between approximately March 1 (or when heavy rains [greater than ½" in 24 hrs.] cease and/or evening temperatures remain above 45F) and April 15 (after which time females will begin to give birth to pups.***
2. ***Between September 1 (after all pups are self-sufficiently volant) and approximately October 15 (or before heavy rains [greater than ½" in 24 hrs.] begin and/or evening temperatures fall below 45F)***

Table 4: Recommended Mitigation Measures for Structures – 7097 Westside Road

Structure	Site Location	Occupied?	Mitigation
Large barn	East	Y	Conduct partial dismantling of structure to reduce habitat suitability (see text for full details); 1. Work must be conducted under direct supervision of a qualified bat biologist. 2. Partial dismantling must occur only between Mar. 1 – Apr. 15, or Sep. 1 – Oct. 15. 3. Supplemental illumination must be used in the loft to cause bats to abandon vertical gaps in bottoms of hop cars.
Hop Barn (southern)	East	Y	Conduct partial dismantling of structure to reduce habitat suitability (see text for full details); 1. Work must be conducted under direct supervision of a qualified bat biologist. 2. Partial dismantling must occur only between Mar. 1 – Apr. 15, or Sep. 1 – Oct. 15. 3. Supplemental illumination must be used in the loft to cause bats to abandon vertical gaps in bottoms of hop cars.
Hop Barn (northern)	East	Y	Conduct partial dismantling of structure to reduce habitat suitability (see text for full details); 1. Work must be conducted under direct supervision of a qualified bat biologist. 2. Partial dismantling must occur only between Mar. 1 – Apr. 15, or Sep. 1 – Oct. 15. 3. Supplemental illumination must be used in the loft to cause bats to abandon vertical gaps in bottoms of hop cars.
Small farm house	East	Y	Conduct partial dismantling of structure to reduce habitat suitability (see text for full details); 1. Work must be conducted under direct supervision of a qualified bat biologist. 2. Partial dismantling must occur only between Mar. 1 – Apr. 15, or Sep. 1 – Oct. 15. 3. Supplemental illumination must be used in the loft to cause bats to abandon vertical gaps in bottoms of hop cars.
Chicken coop	East	N	None
Pump storage barn	East	N	Leave barn doors open during daylight hours during partial dismantling of barns and farm house to prevent new occupation.

Impact: Removal of trees may cause direct mortality of roosting bats, if the trees the provide suitable roosting habitat are removed during seasonal periods of inactivity (maternity season or winter).

Mitigation Measure: To prevent direct mortality of bats that may roost in tree cavities, crevices, exfoliating bark, or foliage of the trees identified on the site, the following measures are recommended:

1) Potential habitat trees shall be removed only between approximately March 1, or when evening temperatures are above 45°F and rainfall less than ½" in 24 hours occurs, and April 15, prior to parturition of pups. The next acceptable period is after pups become self-sufficiently volant – September 1 through about October 15, or prior to evening temperatures dropping below 45°F and onset of rainfall greater than ½" in 24 hours.

2) Tree removal shall be conducted using a two-stage process over two consecutive days (e.g. Tuesday and Wednesday, or Thursday and Friday). With this method, small branches and small limbs containing ***no*** cavity, crevice or exfoliating bark habitat on habitat trees, as identified by a qualified bat biologist are removed first on Day 1, ***using chainsaws only*** (no dozers, backhoes, etc.). The following day (Day 2), the remainder of the tree is to be removed. The disturbance caused by chainsaw noise and vibration, coupled with the physical alteration, has the effect of causing colonial bat species to abandon the roost tree after nightly emergence for foraging. Removing the tree the next day prevents re-habituation and re-occupation of the altered tree.

3) Trees containing suitable potential habitat must be trimmed with chainsaws on Day 1 under initial field supervision by a qualified bat expert to ensure that the tree cutters fully understand the process, and avoid incorrectly cutting potential habitat features or trees. After tree cutters have received sufficient instruction, the qualified bat expert does not need to remain on the site.

4) All other vegetation other than trees within the Limit of Work should be removed prior to tree removal, according to the dates provided above. If vegetation must be removed outside those dates, a 50' buffer around each habitat tree should be observed to reduce likelihood of abandonment of the roost and young.

5) If non-habitat trees must be removed outside seasonal periods of bat activity as described above, a 50' buffer around each habitat tree should be observed to reduce likelihood of abandonment of the roost and young.

6) In order to minimize potential take of solitary bats such as *L. blossevillii* or *L. cinereus*, tree removal should begin with the smaller trees and vegetation on the site, followed by smaller trees in each location where trees are to be removed. Only chainsaws should be used, to create a noise disturbance that will be sufficient to cause roosting individual *L. blossevillii* or *L. cinereus* to abandon the site.

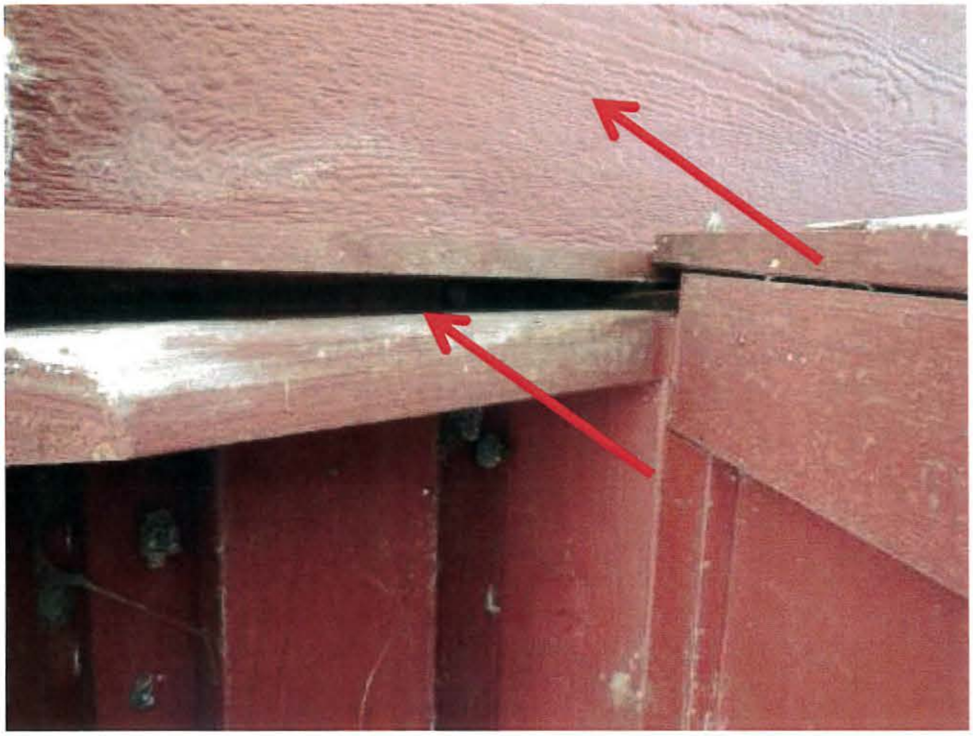

Figure 20. Residence. Arrows show active roost area and entry.

Figure 21. Residence. Rafter blocking potential roost entrances for bats.

Movement Corridors

Although 3.47 acres are proposed for development no impacts to movement corridors for wildlife will occur. The drainages on the east side will not be developed, nor will the coast live oak woodland. Although the winery building on the west side of the proposed project area extends to the property line on both sides there is suitable undeveloped areas for wildlife to move around the building. The proposed winery would not be a barrier to movement, and animals can move around the structures at night. Thus, no impediment to movement corridors will occur from the proposed project. After the project is built, no peripheral barriers, such as fencing, will be installed.

APPENDIX A: FEDERAL, STATE AND LOCAL PLANS, POLICIES, REGULATIONS AND ORDINANCES

Federal Endangered Species Act - U.S. Fish and Wildlife Service
Pursuant to ESA, the U.S. Fish and Wildlife Service (USFWS) has regulatory authority over federally listed species. Under ESA, a permit to "take" a listed species is required for any federal action that may harm an individual of that species. Take is defined under Section 9 of ESA as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to engage in any such conduct." Under federal regulation, take is further defined to include habitat modification or degradation where it would be expected to result in death or injury to listed wildlife by significantly impairing essential behavioral patterns, including breeding, feeding, or sheltering. Section 7 of ESA requires all federal agencies to consult with USFWS to ensure that their actions are not likely to "jeopardize the continued existence" of any listed species or "result in the destruction or adverse modification" of designated critical habitat. No federal approvals or other actions are anticipated as being required to implement the project at this time. Therefore, consultation under Section 7 of ESA is not expected. However, if USACE determines that wetlands and/or other waters of the United States on the project site are subject to protection under Section 404 of the CWA, or any other federal action becomes necessary, consultation under Section 7 of ESA would be required.

For projects where federal action is not involved and take of a listed species may occur, the project proponent may seek to obtain a permit for incidental take under Section 10(a) of ESA. Section 10(a) of ESA allows USFWS to permit the incidental take of listed species if such take is accompanied by a habitat conservation plan (HCP) that includes components to minimize and mitigate impacts associated with the take. The permit is known as an incidental take permit. The project proponent must obtain a permit before conducting any otherwise-lawful activities that would result in the incidental take of a federally listed species.

Sections 404 and 401 of the Clean Water Act - U.S. Army Corps of Engineers
USACE regulates the discharge of dredged or fill material into waters of the United States under Section 404 of the CWA. Waters of the United States are defined as waters where use, degradation, or destruction could affect interstate or foreign commerce, tributaries to any of these waters, and wetlands that meet any of these criteria or that are somehow connected to any of these waters or their tributaries. Wetlands are defined as areas that are inundated or saturated by surface water or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted to life in saturated soil conditions. Wetlands falling under USACE jurisdiction must demonstrate the presence of three specific wetland parameters: hydric soils, hydrophytic vegetation, and sufficient wetland hydrology. Generally, wetlands include swamps, marshes, bogs, and similar areas. Lakes, rivers, and streams are defined as "other waters." Jurisdictional limits of these features are typically noted by the ordinary high-water mark (OHWM). The OHWM is the line on the shore or bank that is established by the fluctuations of water and indicated by physical characteristics, such as a clear, natural line impressed on the bank, shelving, changes in soils, lack of woody or terrestrial vegetation, the presence of litter or debris, or other characteristics of the surrounding areas.

Isolated ponds or seasonal depressions had been previously regulated as waters of the United States. However, in Solid Waste Agency of Northwestern Cook County (SWANCC) v. United States Army Corps of Engineers et al. (January 8, 2001), the U.S. Supreme Court ruled that certain "isolated" wetlands (e.g., nonnavigable, isolated, and intrastate) do not fall under the jurisdiction of the CWA and are no longer under USACE jurisdiction (although isolated wetlands are regulated by the State of California under the Porter-Cologne Water Quality Control Act—see discussion below). Some circuit courts (e.g., U.S. v. Deaton, 2003; U.S. v. Rapanos, 2003; Northern California River Watch v. City of Healdsburg, 2006), however, have ruled that the SWANCC opinion does not prevent CWA jurisdiction if a "significant nexus" such as a hydrologic connection exists, whether it be human-made (e.g., roadside ditch) or natural tributary to navigable waters, or direct seepage from the wetland to the navigable water, a surface or underground hydraulic connection, an ecological connection (e.g., the same bird, mammal, and fish populations are supported by both the wetland

and the navigable water), and changes to chemical concentrations in the navigable water due to water from the wetland.

Section 404 prohibits the discharge of dredged or fill material into waters of the United States (including wetlands) without a permit from USACE. With respect to the proposed project, the discharge of dredged or fill material includes the following activities:

- placement of fill that is necessary for the construction of any structure or infrastructure in a water of the United States;
- the building of any structure, infrastructure, or impoundment requiring rock, sand, dirt, or other material for its construction;
- site-development fills for recreational, industrial, commercial, residential, or other uses; and
- construction of causeways or road fills.

The regulations and policies of USACE, the U.S. Environmental Protection Agency (EPA), and USFWS mandate that the filling of wetlands be avoided unless it can be demonstrated that no practicable alternatives (to filling wetlands) exist. If the placement of fill into waters of the U.S., including wetlands, meets certain criteria the project be permitted under one of the Nation Wide Permits (NWP), which is an expedited permit process.

Section 401 of the CWA requires an applicant for any federal permit that may result in a discharge into waters of the United States to obtain a certification from the state that the discharge will comply with provisions of the CWA. The regional water quality control boards (RWQCBs) administer this program. Any condition of water quality certification would be incorporated into the USACE permit. The state has a policy of no net loss of wetlands and typically requires mitigation for impacts on wetlands before it will issue a water quality certification.

California Endangered Species Act (CESA)

The California Endangered Species Act (CESA) (FGC §§ 2050–2116) is administered by the California Department of Fish and Wildlife. The CESA prohibits the "taking" of listed species except as otherwise provided in state law. The CESA includes FGC Sections 2050–2116, and policy of the state to conserve, protect, restore, and enhance any endangered species or any threatened species and its habitat. The CESA requires mitigation measures or alternatives to a proposed project to address impacts to any State listed endangered, threatened or candidate species, or if a project would jeopardize the continued existence of any endangered or threatened species or result in the destruction or adverse modification of habitat essential to the continued existence of those species, if there are reasonable and prudent alternatives available consistent with conserving the species or its habitat which would prevent jeopardy. Section 86 of the FGC defines take as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill." Unlike the ESA, CESA applies the take prohibitions to species under petition for listing (state candidates) in addition to listed species. Section 2081 of the FGC expressly allows DFG to authorize the incidental take of endangered, threatened, and candidate species if all of the following conditions are met:

- The take is incidental to an otherwise lawful activity.
- The impacts of the authorized take are minimized and fully mitigated.
- Issuance of the permit will not jeopardize the continued existence of the species.
- The permit is consistent with any regulations adopted in accordance with §§ 2112 and 2114 (legislature-funded recovery strategy pilot programs in the affected area).
- The applicant ensures that adequate funding is provided for implementing mitigation measures and monitoring compliance with these measures and their effectiveness.

The CESA provides that if a person obtains an incidental take permit under specified provisions of the ESA for species also listed under the CESA, no further authorization is necessary under CESA if the federal permit satisfies all the requirements of CESA and the person follows specified steps (FGC § 2080.1).

California Environmental Quality Act (CEQA)

CEQA is a California statute passed in 1970, shortly after the United States federal government passed NEPA, to institute a statewide policy of environmental protection. CEQA does not directly regulate land uses, but instead requires state and local agencies within California to follow a protocol of analysis and public disclosure of environmental impacts of proposed projects and adopt all feasible measures to mitigate those impacts.

The CEQA statute, California Public Resources Code § 21000 et seq., codifies a statewide policy of environmental protection. According to CEQA, all state and local agencies must give major consideration to environmental protection in regulating public and private activities, and should not approve projects for which there exist feasible and environmentally superior mitigation measures or alternatives.

Species Protection under California Department of Fish and Wildlife
The CDFW is established under the Fish and Game Code (FGC) (FGC § 700) and states that the fish and wildlife resources of the state are held in trust for the people of the state by and through CDFW (FGC § 711.7(a)). All licenses, permits, tag reservations and other entitlements for the take of fish and game authorized by FGC are prepared and issued by CDFW (FGC § 1050 (a)).

Provisions of the FGC provide special protection to certain enumerated species such as:

§ 3503 protects eggs and nests of all birds.
§ 3503.5 protects birds of prey and their nests.
§ 3511 lists fully protected birds.
§ 3513 protects all birds covered under the federal Migratory Bird Treaty Act.
§ 3800 defines nongame birds.
§ 4150 defines nongame mammals.
§ 4700 lists fully protected mammals.
§ 5050 lists fully protected amphibians and reptiles.
§ 5515 lists fully protected fish species.

In addition, the Native Plant Protection Act (NPPA), directs the CDFW to carry out the Legislature's intent to "preserve, protect and enhance rare and endangered plants in this State." As a result, the NPPA allows the California Fish and Game Commission to designate native plants as endangered or rare, and to require permits for collecting, transporting, or selling such plants.

California Native Plant Society (CNPS)
The California Native Plant Society (CNPS) is a statewide non-profit organization dedicated to the monitoring and protection of sensitive species in California. The CNPS publishes and maintains an Inventory of Rare and Endangered Vascular Plants of California, focusing on geographic distribution and qualitative characterization of rare, threatened, or endangered vascular plant species of California. The list serves as the candidate list for listing as threatened and endangered by the CDFG. The Inventory assigns plants to the following categories:

A. Presumed Extinct in California
B. Rare or endangered in California and elsewhere
Rare or endangered in California, more common elsewhere
Plants for which more information is needed
Plants of limited distribution.

Additional rarity, endangerment, and distribution codes are assigned to each taxa.

Plants on Lists 1A, 1B, and 2 of the CNPS Inventory consist of plants that may qualify for listing, and the Department recommends they be addressed in CEQA projects (CEQA Guidelines Section 15380). However, a plant need not be in the Inventory to be considered a rare, threatened, or endangered species under CEQA. In addition, the DFG recommends, and local governments may require, protection of plants which are regionally significant, such as locally rare species, disjunct populations of more common plants, or plants on the CNPS Lists 3 and 4.

Waters of the State - California Regional Water Quality Control Board
The term "Waters of the State" is defined by the Porter-Cologne Act as "any surface water or groundwater, including saline waters, within the boundaries of the state." The Regional Water Quality Control Board (RWQCB) protects all waters in its regulatory scope, but has special responsibility for wetlands, riparian areas, and headwaters. These waterbodies have high resource value, are vulnerable to filling, and are not systematically protected by other programs. RWQCB jurisdiction includes "isolated" wetlands and waters that may not be regulated by the USACE under Section 404. "Waters of the State" are regulated by the RWQCB under the State Water Quality Certification Program which regulates discharges of fill and dredged material under Section 401 of the Clean Water Act and the Porter-Cologne Water Quality Control Act. Projects that require a USACE permit, or fall under other federal jurisdiction, and have the potential to impact "Waters of the State," are required to comply with the terms of the Water Quality Certification determination.

If a proposed project does not require a federal permit, but does involve dredge or fill activities that may result in a discharge to "Waters of the State," the RWQCB has the option to regulate the dredge and fill activities under its state authority in the form of Waste Discharge Requirements.

Streams, Lakes, and Riparian Habitat - California Department of Fish and Game
Streams and lakes, as habitat for fish and wildlife species, are subject to jurisdiction by CDFG under Sections 1600-1616 of the State Fish and Game Code. Alterations to or work within or adjacent to streambeds or lakes generally require a 1602 Lake and Streambed Alteration Agreement. The term stream, which includes creeks and rivers, is defined in the California Code of Regulations (CCR) as follows: "a body of water that flows at least periodically or intermittently through a bed or channel having banks and supports fish or other aquatic life. This includes watercourses having a surface or subsurface flow that supports or has supported riparian vegetation" (14 CCR 1.72). In addition, the term stream can include ephemeral streams, dry washes, watercourses with subsurface flows, canals, aqueducts, irrigation ditches, and other means of water conveyance if they support aquatic life, riparian vegetation, or stream-dependent terrestrial wildlife (CDFG ESD 1994). Riparian is defined as, "on, or pertaining to, the banks of a stream;" therefore, riparian vegetation is defined as, "vegetation which occurs in and/or adjacent to a stream and is dependent on, and occurs because of, the stream itself" (CDFG ESD 1994). Removal of riparian vegetation also requires a Section 1602 Lake and Streambed Alteration Agreement from CDFG.

Native Tree Protection and Preservation - Sonoma County
Pursuant to the Sonoma County Native Tree Protection and Preservation Ordinance, Chapters 25 and 26 of the Sonoma County Zoning Regulations, the County requires that projects shall be designed to minimize the destruction of protected trees.. Trees protected include the following: Big Leaf Maple (*Acer macrophyllum*), Black Oak (*Quercus kelloggii)*, Blue Oak (*Quercus douglasii*), Coast Live Oak (*Quercus agrifolia*), Interior Live Oak (*Quercus wislizenii*), Madrone (*Arbutus menziesii*), Oracle Oak (*Quercus morehus*), Oregon Oak (*Quercus garryana*), Redwood (*Sequoia sempervirens*), Valley Oak (*Quercus lobata*), California Bay (*Umbellularia californica*), and their hybrids.

With development permits a site plan shall be submitted that depicts the location of all protected trees greater than nine inches (9") and their protected perimeters in areas that will be impacted by the proposed development, such as the building envelopes, access roads, leachfields, etc. Lot line adjustments, zoning permits and agricultural uses are exempt from this requirement. The provisions of this section shall not apply to trees which are the subject of a valid timber harvesting permit approved by the state of California. This section shall not be applied in a manner that would reduce allowable density lower than that permitted as a result of CEQA or by other county ordinances or render a property undevelopable. To achieve this end, adjustments may be made.

Replacement trees may be located on residentially zoned parcels of at least one and one-half acres and on any commercial or industrial zoned parcel, regardless of size, where feasible. Where infeasible, they may be located on public lands or maintained private open space. In-lieu fees may be used to acquire and protect stands of native trees in preserves or place trees on public lands.

Permits to remove trees will take into account the environmental effects of removal, possible alternatives to removal, and whether preservation unreasonably interferes with development of the parcel. Required mitigation may include:

1. establishment and maintenance of replacement trees;
2. a detailed mitigation management plan;
3. removal of invasive exotics; and
4. posting of a bond to cover the cost of an inspection to ensure the success of measures
5. described above.

Appendix B: Potentially Occurring Special-Status Plant Species in the Study Area

Scientific Name **Common Name**	**Status USFWS/ CDFW/ CNPS list**	**Habitat Affinities and Blooming Period/Life Form**	**Potential for Occurrence**
Alopecurus aequalis var. *sonomensis* Sonoma alopecurus	FE/-/1B	Freshwater marshes and swamps, riparian scrub. May-July. Elevation: 5-365m.	None. No habitat present in study area.
Amorpha californica var. *napensis* Napa false indigo	-/-/1B	Broadleafed upland forest (openings), chaparral, cismontane woodland. Blooms April-July. Elevation: 120-2000m.	None. No habitat present in study area.
Arctostaphylos bakeri ssp. *bakeri* Baker's manzanita	-/CR/1B	Broadleafed upland forest, chaparral often on serpentinite. Blooms February to April. Elevation: 75-300m.	None. No habitat present in study area.
Arctostaphylos bakeri ssp. *sublevis* The Cedars manzanita	-/CR/1B	Closed-cone coniferous forest, chaparral, often on serpentine. Blooms February to April.	None. No habitat present in study area.
Arctostaphylos densiflora Vine Hill manzanita	-/CE/1B	Chaparral on acid marine sand. February-April. Elevation: 50-120m.	None. No habitat present in study area.
Arctostaphylos hispidula Howell's mananita	-/-/1B	Chaparral on serpentinite or sandstone. Blooms March to April. Elevation: 120-1250m.	None. No habitat present in study area.
Arctostaphylos stanfordiana ssp. *decumbens* Rincon Ridge manzanita	-/-/1B	Chaparral on rhyolitic soils and cismontane woodland. Blooms February to April (sometimes May). Elevation: 75-370m.	None. No habitat present in study area.
Blennosperma bakeri Sonoma sunshine	FE/CE/1B	Valley and foothill grassland (mesic), vernal pools. Blooms March to May. Elevation: 10-110m.	None. Not observed during surveys. Typical habitat not present in study area.
Brodiaea leptandra Narrow-anthered brodiaea	-/-/1B	Broadleafed upland forest, chaparral, cismontane woodland, lower montane coniferous forest, valley and foothill grassland on volcanic soils. Blooms May to July. Elevation: 110-915m.	None. Typical habitat present in study area. Not observed during surveys.
Calamagrostis bolanderi Bolander's reed grass	-/-/4	Bogs and fens, broadleafed upland forest, closed-cone coniferous forest, coastal scrub, meadows and seeps, freshwater marshes and swamps, North Coast coniferous forest on mesic sites. May-August. Elevation: 0-455m.	None. No habitat present in study area. Not observed during surveys.

Scientific Name **Common Name**	**Status USFWS/ CDFW/ CNPS list**	**Habitat Affinities and Blooming Period/Life Form**	**Potential for Occurrence**
Calamagrostis crassiglumis Thurber's reed grass	-/-/2B	Coastal scrub (mesic), freshwater marshes and swamps. Blooms April to July. Elevation: 90-1065m.	None. No habitat present in study area. Not observed during surveys.
Campanula californica Swamp harebell	-/-/1B	Bogs and fens, closed-cone coniferous forest, coastal prairie, meadows and seeps, freshwater marshes and swamps, North Coast coniferous forest. June-October. Elevation: 1-405m.	None. No habitat present in study area.
Carex comosa Bristly sedge	-/-/2B	Coastal prairie, marshes and swamps, lake margins, mesic sites in grasslands. Blooms May to Sept.	None. No habitat present in study area.
Castilleja ambigua var. *ambigua* Johnny-nip	-/-/4	Coastal bluff scrub, coastal prairie, coastal scrub, marshes and swamps, valley and foothill grassland, margins of vernal pools. Blooms March to August. Elevation 0-435m.	None. Typical habitat not present in study area. Not observed during surveys.
Castilleja uliginosa Pitkin Marsh paintbrush	-/CE/1A	Freshwater marshes and swamps. June-July. Elevation: 60m.	None. No habitat present in study area.
Ceanothus confusus Rincon Ridge ceanothus	-/-/1B	Closed-cone coniferous forest, chaparral, cismontane woodland on volcanic or serpentinite. Blooms February to June. Elevation: 75-1065m.	None. No habitat present in study area..
Ceanothus foliosus var. *vineatus* Vine Hill ceanothus	-/-/1B	Chaparral. March-May. Elevation: 45-305m.	None. No habitat present in study area.
Ceanothus gloriosus var. *exaltatus* Glory brush	-/-/4	Chaparral. Blooms March to August. Elevation: 30-610m.	None. No habitat present in study area.
Ceanothus purpureus Holly-leaved ceanothus	-/-/1B	Chaparral and cismontane woodland with rocky, volcanic substrate. Blooms February to June. Elevation: 120-640m.	None. No habitat present in study area.
Centromadia parryi ssp. *parry* Pappose tarplant	-/-/1B	Chaparral, coastal prairie, meadows and seeps, coastal marshes and swamps, valley and foothill grassland on vernally mesic, often alkaline sites. May-November. Elevation: 2-420m.	None. Typical habitat not present in study area. Not observed during surveys.
Chorizanthe valida Sonoma spineflower	FE/CE/1B	Coastal prairie on sandy soils. Blooms June to August. Elevation: 10-305m.	None. No habitat present in study area.

Scientific Name **Common Name**	**Status USFWS/ CDFW/ CNPS list**	**Habitat Affinities and Blooming Period/Life Form**	**Potential for Occurrence**
Clarkia imbricata Vine Hill clarkia	FE/CE/1B	Chaparral, valley and foothill grassland on acidic sandy loam soils. June-August. Elevation: 50-75m.	None. No habitat in study area.
Cordylanthus tenuis ssp. *brunneus* Serpentine bird's-beak	-/-/4	Closed-cone coniferous forest, chaparral, cismontane woodland on serpentinite. Blooms July to August. Elevation: 475-915m.	None. No habitat present in study area.
Cordylanthus tenuis ssp. *capillaris*	FE/CR/1B	Closed-cone coniferous forest, chaparral on serpentinite. June-September. Elevation: 45-305m.	None. No habitat in study area.
Cuscuta obtusiflora var. *glandulosa*	-/-/2B	Freshwater marshes and swamps. July-October. Elevation: 15-280m.	None. No habitat in study area.
Delphinium bakeri Baker's larkspur	FE/CE/1B	Broadleafed upland forest, coastal scrub, valley and foothill grassland, on decomposed shale, often mesic. Blooms March to May. Elevation: 80-305m.	None. Typical habitat not present in study area. Not observed during surveys.
Delphinium luteum Golden larkspur	FE/CR/1B	Chaparral, coastal prairie, coastal scrub on rocky soils. March-May. Elevation: 0-100m.	None. Not observed during surveys. Habitat not present on site.
Downingia pusilla Dwarf downingia	-/-/2B	Valley and foothill grassland (mesic), vernal pools. Blooms March to May. Elevation: 1-445m.	None. Not observed during surveys. Typical habitat not present in study area.
Erigeron biolettii Streamside daisy	-/-/3	Broadleafed upland forest, cismontane woodland, North Coast coniferous forest on rocky and mesic sites. Blooms June-October. Elevation 30-1100m.	None. No habitat present in study area.
Erigeron greenei Greene's narrow-leaved daisy	-/-/1B	Chaparral on serpentinite or volcanic soils. Blooms May to September. Elevation: 80-1005m.	None. No habitat present in study area.
Erigerion serpentinus Serpentine daisy	-/-/1B	Chaparral on serpentine and seeps. May-August. Elevation: 60-670m.	None. No habitat in study area.
Eriophorum gracile Slender cottongrass	-/-/4	Bogs and fens, meadows and seeps, upper montane coniferous forest on acidic soils. Blooms May to September. Elevation: 1280-2900m.	None. No habitat in study area.

Scientific Name **Common Name**	**Status USFWS/ CDFW/ CNPS list**	**Habitat Affinities and Blooming Period/Life Form**	**Potential for Occurrence**
Fritillaria liliacea Fragrant fritillary	-/-/1B	Cismontane woodland, coastal prairie, coastal scrub, valley and foothill grassland often on serpentinite. Blooms February to April. Elevation: 3-410m.	None. Not observed during surveys. Typical habitat not present in study area.
Gilia capitata ssp. *tomentosa* Woolly-headed gilia	-/-/1B	Coastal bluff scrub, valley and foothill grassland on serpentinite or rocky soils or outcrops. Blooms May to July. Elevation: 10-220m.	None. Not observed during surveys. Typical habitat not present in study area.
Hemizonia congesta ssp. *congesta* White seaside tarplant	-/-/1B	Valley and foothill grassland sometimes on roadsides. Blooms April to November. Elevation: 20-560m.	None. Not observed during surveys. No species of *Hemizonia* were observed in the study area.
Horkelia tenuiloba Thin-leaved horkelia	-/-/1B	Broadleafed upland forest, chaparral, valley and foothill grassland in mesic openings and on sandy soils. Blooms May to July. Elevation: 50-500m.	None. Not observed during surveys. No habitat present in study area.
Hosackia gracilis Harlequin lotus	-/-/4	Broadleafed upland forest, coastal bluff scrub, closed-cone coniferous forest, cismontane woodland, coastal prairie, coastal scrub, meadows and seeps, marshes and swamps, North Coast coniferous forest, valley and foothill grassland/wetlands, roadsides. Blooms March to July. Elevation: 0-700m.	None. Not observed during surveys. Typical habitat not present in study area.
Lasthenia burkei Burke's goldfields	FE/CE/1B	Meadows and seeps (mesic), vernal pools. April-June. Elevation: 15-600m.	None. Not observed during surveys. No habitat present in study area.
Lasthenia californica ssp. *bakeri* Baker's goldfields	-/-/1B	Closed-cone coniferous forest (openings), coastal scrub, meadows and seeps, marshes and swamps. April-October. Elevation: 60-520m.	None. Not observed during surveys. No habitat present in study area.
Legenere limosa Legenere	-/-/1B	Vernal pools. Blooms April-June. Elevation: 1-880m.	None. Not observed during surveys. No habitat present in study area.
Leptosiphon jepsonii Jepson's leptosiphon	-/-/1B	Chaparral, cismontane woodland, usually volcanic. Blooms March to May. Elevation: 100-500m.	None. Not observed during surveys. No habitat present in study area.

Scientific Name **Common Name**	**Status USFWS/ CDFW/ CNPS list**	**Habitat Affinities and Blooming Period/Life Form**	**Potential for Occurrence**
Lessingia arachnoidea Crystal Springs Lessingia	-/-/1B	Cismontane woodland, coastal scrub, valley and foothill grassland. Blooms July to October.	None. Not observed during surveys. Typical habitat not present in study area.
Lessingia hololeuca Woolly-headed Lessingia	-/-/3	Broadleafed upland forest, coastal scrub, lower montane coniferous forest, valley and foothill grassland. Blooms June to October. Elevation: 15-305m.	None. Not observed during surveys. Typical habitat not present in study area.
Lilium pardalinum ssp. *pitkinense* Pitkin Marsh lily	FE/CE/1B	Cismontane woodland, meadows and seeps, freshwater marshes and swamps, in mesic and sandy soils. June-July. Elevation: 35-65m.	None. No habitat present in study area.
Limnanthes vinculans Sebastopol meadowfoam	FE/CE/1B	Meadows and seeps, valley and foothill grassland, vernal pools/vernally mesic. April-May. Elevation: 15-305m.	None. Not observed during surveys. No habitat present in study area.
Microseris paludosa Marsh microseris	-/-/1B	Closed-cone coniferous forest, cismontane woodland, coastal scrub, valley and foothill grassland. April-June (sometimes July). Elevation: 5-300m.	None. Not observed during surveys. Typical habitat not present in study area.
Navarretia leucocephala ssp. *bakeri* Baker's navarretia	-/-/1B	Cismontane woodland, lower montane coniferous forest, meadows and seeps, valley and foothill grassland, vernal pools/mesic. Blooms April to July. Elevation: 5-1740m.	None. Not observed during surveys. Typical habitat not present in study area.
Navarretia leucocephala ssp. *plieantha* Many flowered navarretia	FE/-/1B	Volcanic ash flow vernal pools. Blooms May to June. Elevation: 30-950 m.	None. Not observed during surveys. No habitat present in study area.
Pleuropogon hooverianus North Coast semaphore grass	-/CT/1B	Broadleafed upland forest, meadows and seeps, North Coast coniferous forest. Blooms April to June. Elevation: 10-671m.	None. Not observed during surveys. No habitat present in study area.
Ranunculus lobbii Lobb's aquatic buttercup	-/-/4	Cismontane woodland, North Coast coniferous forest, valley and foothill grassland and vernal pools in mesic sites. Blooms February to May. Elevation: 15-470m.	None. Not observed during surveys. No habitat present in study area.
Rhynchospora alba White beaked-rush	-/-/2B	Bogs and fens, meadows and seeps, freshwater marshes and swamps. July-August. Elevation: 60-2040m.	None. Not observed during surveys. Typical habitat not present in study area.

Scientific Name **Common Name**	**Status USFWS/ CDFW/ CNPS list**	**Habitat Affinities and Blooming Period/Life Form**	**Potential for Occurrence**
Rhynchospora californica California beaked-rush	-/-/1B	Bogs and fens, lower montane coniferous forest, meadows and seeps, freshwater marshes and swamps. May-July. Elevation: 45-1010m.	None. Not observed during surveys. Habitat not present in study area.
Rhynchospora capitellata Brownish beaked-rush	-/-/2B	Lower montane coniferous forest, meadows and seps, marshes and swamps, upper montane coniferous forest/mesic. July-August. Elevation: 45-2000m.	None. Not observed during surveys. Habitat not present in study area.
Rhynchospora globularis Round-headed beaked-rush	-/-/2B	Freshwater marshes and swamps. Blooms July to August. Elevation: 45-60m.	None. No habitat present in study area.
Trifolium amoenum Showy Rancheria clover	FE/-/1B	Coastal bluff scrub, valley and foothill grassland, sometimes on serpentinite. Blooms April to June. Elevation: 5-415m.	None. No habitat present in study area.
Trifolium hydrophilum Saline clover	-/-/1B	Marshes and swamps, valley and foothill grassland (mesic, alkaline), vernal pools. April-June. Elevation: 0-300m.	None. Not observed during surveys. Typical habitat not present in study area.
Viburnum ellipticum Oval-leaved viburnum	-/-/2B	Chaparral, cismontane woodland, lower montane coniferous forest. Blooms May to June. Elevation: 215-1400m.	None. Not observed during surveys. No habitat present in study area.
Usnea longissima Long-beard lichen	-/-/4	Broadleafed upland forest, North Coast coniferous forest on tree branches; usually on old growth hardwoods and conifers. Elevation: 50-1460m.	None. Suitable habitat not present on site. Not observed during surveys.
Special Status Vegetation Communities			
SPECIAL NATURAL COMMUNITIES			
Coastal and Valley Freshwater Marsh			None
Northern Hard Pan Vernal Pool			
Northern Vernal Pool			None

CALIFORNIA NATIVE PLANT SOCIETY -

List 1:	Plants of highest priority
List 1A:	Plants presumed extinct in California
List 1B:	Plants rare and endangered in California and elsewhere
List 2:	Plants rare and endangered in California but more common elsewhere
List 3:	Plants about which additional data are needed

Appendix C: Potentially Occurring Special-Status Animal Species in the Project Area

Common Name Scientific Name	Status USFWS/ CDFW	Habitat Affinities and Reported Localities in the Project Area	Occurrence for Potential
Invertebrates			
Giuliani's dubiraphian riffle beetle *Dubiraphia giulianii*	-/CSC	Inhabits exposed, wave-washed willow roots in the slow flows of the Russian River.	None: no suitable habitat.
California linderiella *Linderiella occidentalis*	-/CSC	Seasonal pools in unplowed grasslands with old alluvial soils underlain by hardpan or in sandstone depressions.	None: no suitable habitat.
Fish			
Russian River tule perch *Hysterocarpus traskii pomo*	-/SSC	Occurs in low elevation streams of the Russian River. Requires clear, flowing water with abundant cover and deep (>1M) pool habitat.	None: no suitable habitat.
Navarro roach *Lavinia symmetricus navarroensis*	-/SSC	Habitat generalists, found in warm intermittent streams as well as cold, well-aerated streams.	None: no suitable habitat.
Coho salmon - Central California Coast ESU *Onchorhynchus kisutch*	FE/SE	Occurs from Punta Gorda, in northern California, to the San Lorenzo River, in Santa Cruz County, and includes coho salmon populations from several tributaries of San Francisco Bay (e.g., Corte Madera and Mill Valley Creek).	None: no suitable habitat.
steelhead - Central California Coast DPS *Onchorhynchus mykiss*	FT/SSC	Requires beds of loose, silt-free, coarse gravel for spawning. Also needs cover, cool water and sufficient dissolved oxygen. Species reported in Sonoma Creek (CNDDB 2012).	None: no suitable habitat.
Amphibians			
foothill yellow-legged frog *Rana boylii*	-/ SSC	Inhabits permanent, flowing stream courses with a cobble substrate and a mixture of open canopy riparian vegetation. Species reported more than 3 miles in distance from project site (CNDDB 2012).	None: no suitable habitat.
California red-legged frog *Rana draytonii*	FT/ SSC	Prefers semi-permanent and permanent stream pools, ponds and creeks with emergent and/or riparian vegetation. Occupies upland habitat especially during the wet winter months. Species reported more than 3 miles in distance from project site (CNDDB 2014).	**Low**: provides suitable habitat outside project area, but high predator load.
Reptiles			
western pond turtle *Emys marmorata marmorata*	-/ SSC	Prefers permanent, slow-moving creeks, streams, ponds, rivers, marshes and irrigation ditches with basking sites and a vegetated shoreline. Requires upland sites for egg-laying. Species reported more than 3 miles in distance from project site (CNDDB 2014).	**High**: pond on site provides suitable habitat.

Common Name Scientific Name	Status USFWS/ CDFW	Habitat Affinities and Reported Localities in the Project Area	Occurrence for Potential
		Birds	
Cooper's hawk *Accipiter cooperi*	MB/ SSC	Nests primarily in deciduous riparian forests. May also occupy dense canopied forests from gray pine-oak woodland to ponderosa pine. Forages in open woodlands.	None: no suitable habitat.
sharp-shined hawk *Accipiter striatus*	MB/ SSC	Dense canopy pine or mixed conifer forest and riparian habitats. Water within one mile required.	None: no suitable habitat.
Great blue heron *Ardea herodius*	MB/ SSC	Nests colonially in large trees near water	None: no suitable habitat.
white-tailed kite *Elanus leucurus*	MB/CFP	Inhabits low rolling foothills and valley margins with scattered oaks and river bottom- lands or marshes adjacent to deciduous woodlands. Prefers open grasslands, meadows and marshes for foraging close to isolated, dense-topped trees for nesting and perching.	None: would have been detected during field surveys.
Osprey *Pandion haliaetus*	-/SSC	Nests in large trees within 15 miles of good fish-producing water body.	None: no suitable habitat.
black phoebe *Sayornis nigricans*	MB/-	Nests in anthropogenic structures on ledges. Nest made of mud pellets, dry grasses, weed stems, plant fibers and hair.	**Observed on-site.**
		Mammals*	
Pallid bat *Antrozous pallidus*	-/SSC, WBWG:H	Day roosts in crevices and cavities in rock outcrops, mines, caves, buildings, bridges, properly-designed bat houses, as well as hollows and cavities in a wide variety of tree species. May roost alone, in small groups (2 to 20 bats), or in 100s in maternity roosts, with males and non-reproductive subadults in other, smaller roosts. High reliance on oak woodland habitat in many portions of its range in California, but uses a wide variety of vegetative habitat for foraging. Forages on larger prey taken on the ground or in the air, usually within 6-km of the day roost.	**High:** Suitable potential building habitat occurs on site.

Common Name Scientific Name	Status USFWS/ CDFW	Habitat Affinities and Reported Localities in the Project Area	Occurrence for Potential
Townsend's big-eared bat *Corynorhinus townsendii townsendii*	-/CPE, WBWG:H	Day roosts in cave analogs; mines, buildings, bridges, sometimes large tree hollows. Particularly sensitive to roost disturbance, this species has declined throughout its range in California; very few maternity roosts are known in California. Switches roosts seasonally, sometimes within each season. Females form maternity colonies, males roost singly, and all disperse widely after maternity season. During winter, roosts in cold, but non-freezing roosts, which may include man-made structures. Forages in a variety of habitats, consistently in riparian and stream corridors, avoiding open habitat. May commute relatively long distances to forage.	**Medium**: Suitable potential building habitat occurs on site, but currently less suitable due to disturbance levels.
Western red bat *Lasiurus blossevillii*	-/SSC, WBWG:H	Solitary roosting, except when females are with young (from 2 to 6 are born). Roosts almost exclusively in foliage, under overhanging leaves, in woodland borders, rivers, agricultural areas including orchards, and urban areas with mature trees. Typically found in large cottonwoods, sycamores, walnuts and willows associated with riparian habitats. Forages over mature orchards, oak woodland, low elevation conifer forests, riparian corridors, non-native trees in urban and rural residential areas, and around strong lighting.	**Medium:** Suitable potential tree foliage occurs on site.
Hoary bat *Lasiurus cinereus*	-/-, WBWG:M	Roosts singly except when females are with young (from 2 to 4 are born) in dense foliage of medium to large coniferous and deciduous trees. Highly migratory, occurs from sea level to tree line in Sierra Nevada. Summer records predominantly male. Forages along stream and river corridors, open water bodies, meadows, and open forest above canopy.	**Medium:** Suitable potential tree foliage occurs on site.
California myotis *Myotis californicus*	-/-	Females give birth to one young. Typically roosts alone or in small groups in almost every habitat from desert to mountains, but most abundant at lower to mid-elevations. Roosts in crevices in rocks, slabs, hollow trees, exfoliating bark, buildings, mines. In trees may exhibit low roost fidelity, switching frequently. Emerges early in evening, forages along tree margins, canopy edge, over water, along trails and higher above ground in open habitat. Typically hibernates.	Medium: Potential to occur in trees and buildings.

Common Name Scientific Name	Status USFWS/ CDFW	Habitat Affinities and Reported Localities in the Project Area	Occurrence for Potential
Western small-footed myotis *Myotis ciliolabrum*	-/-, WBWG:M	Females give birth to one young, roosts singly or in small maternity groups in cliff and rock crevices, tree snags, buildings, concrete bridges and viaducts, caves and mines, occasionally under tree bark, swallow nests – males roost singly. Forages in early evening near rocks, bluffs, cliffs and tree margins, as well as water courses, and man-made water impoundments. Hibernates in small numbers.	Low: Potential to occur in buildings.
Long-eared myotis *Myotis evotis*	-/-, WBWG:M	Reproductive females form small maternity colonies between 2-30 individuals; males and non-reproductive females roost singly or in small groups nearby. Found from coastal forests to high elevation, is absent from Central Valley and Sonoran and Colorado desert regions. May switch roosts frequently. Day roosts in hollow trees, under exfoliating bark, caves, mines, bridges, buildings and crevices in rock outcrops, under bark of small black oaks in northern California, also use mixed conifer forests throughout California. Nights roosts include bridges, caves. May hibernate.	Medium: Potential to occur in trees and buildings.
Fringed myotis *Myotis thysanodes*	-/-, WBWG:H	Roosts colonially, up to 2,000 individuals. Females form maternity roosts, give birth to one young. Found from coast to ca. 1,800 m in Sierra Nevadas, though most are known to the west of that range. Rare in all localities, data suggests serious population declines. Roosts in rock crevices, caves, mines, buildings and bridges, as well as tree hollows, particularly large conifer snags. Occurs in xeric woodland, hot desert-scrub, grassland, sage-grassland steppe, spruce-fir, mesic old growth forest, coniferous and deciduous/coniferous forests. Forages over secondary streams in fairly cluttered habitat, over meadows. May hibernate or use intermittent torpor.	Low: Potential to occur in buildings.

Common Name Scientific Name	Status USFWS/ CDFW	Habitat Affinities and Reported Localities in the Project Area	Occurrence for Potential
Long-legged Myotis *Myotis volans*	-/-, WBWG:H	Roosts colonially, females forming maternity colonies, giving birth to single young. Found throughout most of California from the coast to high elevation in Sierra Nevada and White Mountains, as well as mountains of Mojave Desert, central San Diego County, Coast Range, transverse ranges between Los Angeles basin and Central Valley. Roosts from sea level to ca. 3,000 m, in coniferous montaine forests, occasionally riparian and desert habitats. Primarily uses trees, particularly large diameter conifers, under bark and in cavities, sometimes in abandoned buildings, mines, caves, cracks in the ground, and cliff/rock faces. Aerially forages in and around forest canopy. Hibernates in caves and mines.	Low: Potential to occur in buildings.
Yuma myotis *Myotis yumanensis*	-/-, WBWG:M	Forms often large maternity colonies, females giving birth to one young. Generally confined to lower elevations from sea level to up to 1,300 m in central Sierra Nevada and 2,000 m in southern Sierra Nevada. Males roost singly. Primarily a crevice roosting species in natural habitat, forms large maternity colonies in large spaces in man-made roosts, e.g. buildings. Also uses bridges, caves, mines, tree cavities, bat houses, abandoned swallow nests, exfoliating bark. Emerges early and forages almost exclusively over quiet water – ponds, pools, reservoirs, swimming pools. Appears to migrate, may hibernate in colder portions of their range.	**Observed on site: occupying barn and hop kiln.**
Brazilian free-tailed bat *Tadarida brasiliensis*	-/-	Found in large to very large colonies (several hundred to millions), females giving birth to single young in maternity roosts. Found almost everywhere throughout California, from sea level up to about 3,700 m in some western mountain ranges, but mostly below about 2,000 m. Crevice and cavity dwellers, uses rock crevices, caves, mines, buildings, bridges, tunnels, bat houses, culverts, abandoned swallow nests. Forages from 6 m to thousands of meters above ground, often very large distances (<50 km) from day roost. Migrates in colder portions of range, or makes winter movements to Coast Range where it remains active or semi-active throughout winter, using torpor. Can remain active throughout winter in southern portion of state.	**Observed on site: occupying barn and hop kiln.**

* Includes bat species expected to occur in the project region and vicinity based on known roosting ecology and habitat relationships, but not reported in the CNDDB.

WESTERN BAT WORKING GROUP
WBWG:H – High Priority, species are imperiled or are at high risk of imperilment based on available information on distribution, status, ecology and known threats.
WBWG:M – Medium Priority, species are at medium risk of imperilment based on available information on distribution, status, ecology and known threats.

Appendix D: Plant species observed April 28 and May 12, 2014

Scientific Name	**Common Name**
Aesculus californica	California buckeye
Aira caryophyllea	European hair grass*
Alisma trivale	Water plantain
Alnus cordata	Italian alder*
Anagallis arvensis	Scarlet pimpernel*
Anthemis cotula	Mayweed*
Avena barbata	Slender wild oats*
Bellis perennis	English daisy*
Brassica nigra	Black mustard*
Brassica rapa	Field mustard*
Briza minor	Small quaking grass*
Bromus alopecuros	Poverty brome*
Bromus diandrus	Ripgut brome*
Bromus hordaceus	Soft chess*
Capsella bursa-pastoris	Shepherd's purse*
Carduus pycnocephalus	Italian thistle*
Cerastium glomeratum	Mouse-ear chickweed*
Claytonia perfoliata	Miner's lettuce
Convolvulus arvensis	Bindweed*
Cynodon dactylon	Bermuda grass*
Cyperus eragrostis	Umbrella sedge
Elymus triticoides	Creeping wildrye
Erodium botrys	Broad leaved filaree*
Erodium cicutarium	Red stemmed filaree*
Eschscholzia californica	California poppy
Festuca bromoides	Six weeks fescue*
Festuca myuros	Rattail fescue*
Festuca perennis	Ryegrass*
Ficus sp.	Fig trees*
Gleditsia triacanthos	Honey locust*
Helminthotheca echioides	Bristly ox-tongue*
Hordeum brachyantherum	Meadow barley
Hordeum marinum ssp. *gussoneanum*	Mediterranean barley*
Hordeum murinum ssp. *leporinum*	Hare barley*
Hypochaeris radicata	Rough cat's-ear*
Iris sp.	Garden iris*
Juglans hindsii	Northern California black walnut
Juncus tenuis	Povery runs
Lactuca saligna	Willow-leaf lettuce*
Lactuca serriola	Prickly lettuce*
Lamium amplexicaule	Dead nettle*
Lepidium nitidum	Pepperweed
Lobularia maritima	Sweet allysum*
Malus sp.	Apple trees*
Malva sp.	Mallow*
Medicago polymorpha	Bur clover*
Melilotus officinalis	Yellow sweet clover*
Mentha pulegium	Pennyroyal*

Scientific Name	**Common Name**
Phalaris aquatica	Harding grass*
Plantago lanceolata	English plantain*
Poa annua	Annual bluegrass*
Populus fremontii	Fremont cottonwood
Prunus sp.	Fruit trees*
Quercus agrifolia	Coast live oak
Quercus kelloggi	Black oak
Quercus lobata	Valley oak
Quercus rubra	Red oak*
Ranunculus muricatus	Spiny fruited buttercup*
Raphanus sativus	Wild radish*
Rosa sp.	Garden rose*
Rubus armeniacus	Himalayan blackberry*
Rumex crispus	Curly dock*
Rumex pulcher	Fiddle dock*
Senecio vulgaris	Common groundsel*
Sequoia sempervirens	Coast redwood
Sonchus asper	Prickly sow thistle*
Spergularia rubra	Red sandspurrey*
Stellaria media	Common chickweed*
Trifolium hirtum	Rose clover*
Umbellularia californica	California bay laurel
Veronica peregrina ssp. *halapensis*	Hairy purslane speedwell
Vicia sativa	Spring vetch*

* = Non-native species

Appendix E: Wildlife species observed during April 28, 2014

Scientific Name	**Common Name**
Lithobates catesbeianus	Eastern bullfrog
Pseudacris sierrae	Sierran treefrog
Sceloporus occidentalis	Western fence lizard
Calypte anna	Anna's hummingbird
Picoides pubescens	Downy woodpecker
Sayornis saya	Say's phoebe
Tachycineta bicolor	Tree Swallow
Aphelocoma californica	Western scrub jay
Corvus brachyrhynchos	American crow
Junco hyemalis	Dark-eyed junco
Melozone crissalis	California towhee
Pipilo maculatus	Spotted towhee
Odoicoileus hemionius californicus	Black-tailed deer (sign)
Mephitis mephitis	Skunk (sign)
Procyon lotor	Raccoon (sign)

LIST OF APPENDICES

SUMMARY

The Ramey Winery proposed Westside Road Winery and Tasting Room Project, located at 7097 Westside Road, Healdsburg, CA, includes a new winery and wine caves, re-purpose existing 1949 hop kiln into a tasting room, re-furbish 1949 baling barn into marketing center, provide additional driveways and parking areas and enlarge existing driveways to meet Sonoma County Fire Safe Standards, as depicted on the Construction Drawings (Adobe Associates 2014).

Of the 75 acre parcel, approximately 42 acres are currently planted grapes. Of the remaining 33 acres, 3.47 acres (150,942 sq. ft.) are proposed for development.

This Habitat and Site Assessment presents the findings of our literature review (including scientific literature and previous reports detailing studies conducted in the area) and the California Department of Fish and Wildlife's (CDFW) Natural Diversity Data Base (CNDDB) for reported occurrences of special-status vegetation communities, plants and animals.

Three vegetation community types occur within the project area: *Quercus agrifolia* woodland alliance or coast live oak woodland; ruderal non-native grassland; and landscaped areas. The majority of the parcel consists of existing vineyards adjacent to the project area, but they are not part of the proposed project development, nor if the grove of Northern California black walnut (*Juglans hindsii*), which islocated in the eastern part of the property near the Russian River. No development is proposed for the black walnut grove other than placement of some picnic tables which would not impact the trees or the non-native grassland understory. A pond located on the west side is within the property boundary but will not be impacted or developed. The pond does support some willow (*Salix* spp.), and other riparian vegetation.

As part of this Habitat Assessment, we also evaluated the potential for occurrence of 58 special-status plant species, and 26 special-status wildlife species. Surveys for special status plants were conducted on April 28 and May 12, 2014 which covered the flowering period for all of the special status plants that have the potential to occur within the project area based on the presence of potential habitat.

Based on this review and limitations of the present surveys, the following are action items to be addressed prior to ground breaking:

- A certified arborist should conduct a tree inventory that would be used for the tree removal permit from the County and also to provide protection measures for existing native trees adjacent to any development. A tree planting plan may also be required to compensate for the loss of native trees.
- Removal of trees that may support potentially roosting bat species must occur under direct supervision of a bat biologist and occur between March 1 and April 15, or September 1 through October 15.
- Nesting bird survey within one week of the removal of nesting habitat, unless removal occurs after August 15 and before March 1

INTRODUCTION

Mr. David Ramey of Ramey Wine Cellars, contracted with Jane Valerius Environmental Consulting and Wildlife Research Associates to conduct a Habitat Assessment of the 75-acre parcel for their proposed 3.47-acre development. The 7079 Westside Road parcel (APN: 110-240-031 & 040) is located in the western portion of the Dry Creek Valley, in the central portion of Sonoma County, California. This habitat assessment was conducted to determine the potential for special-status vegetation communities, plant and animal species to occur within the proposed project and to identify the limitations to potential development of the project, such as: a) increased on-site flows from impermeable surfaces and, b) habitat removal.

This Habitat Assessment is part of the preliminary analysis of both the existing environment and potential impacts from the proposed project as required under the California Environmental Quality Act (CEQA) for new projects. Federal and state agencies that have purview over biological resources include the following:

- U.S. Army Corps of Engineers (USACE),
- U.S. Fish and Wildlife Service (USFWS),
- National Marine Fisheries Service (NMFS),
- California Regional Water Quality Control Board (RWQCB), and the
- California Department of Fish and Wildlife (CDFW).

The USACE regulates the discharge of dredged or fill material into waters of the United States. Waters of the U.S. are defined as waters that are hydrologically connected to waters with interstate or foreign commerce, and includes tributaries to any of these waters, and wetlands, which are areas that are inundated or saturated by surface water or groundwater at a frequency and duration sufficient to support vegetation typically adapted to life in saturated soil conditions. The USFWS has regulatory authority over federally listed plant and animal species. The NMFS, a division of the National Oceanic and Atmospheric Administration (NOAA), has regulatory authority over essential fish habitat, which is habitat necessary to maintain sustainable fisheries in the United States. The California RWQCB protects all waters with special responsibility for wetlands, riparian areas, and headwaters. The CDFW has regulatory authority over state listed plants and animals as well as streams and lakes within the State.

Locally, Sonoma County has regulatory authority over: a) large native trees, trees with historical importance, and oak woodland habitat, under the Sonoma County Native Tree Protection and Preservation Ordinance, and b) all natural watercourses shown as a solid or dashed blue lines, or along watercourses supporting riparian vegetation, under the Biotic Resource Areas identified in the County General Plan (Sonoma County 2008). See Appendix A for more regulatory details.

Site Location

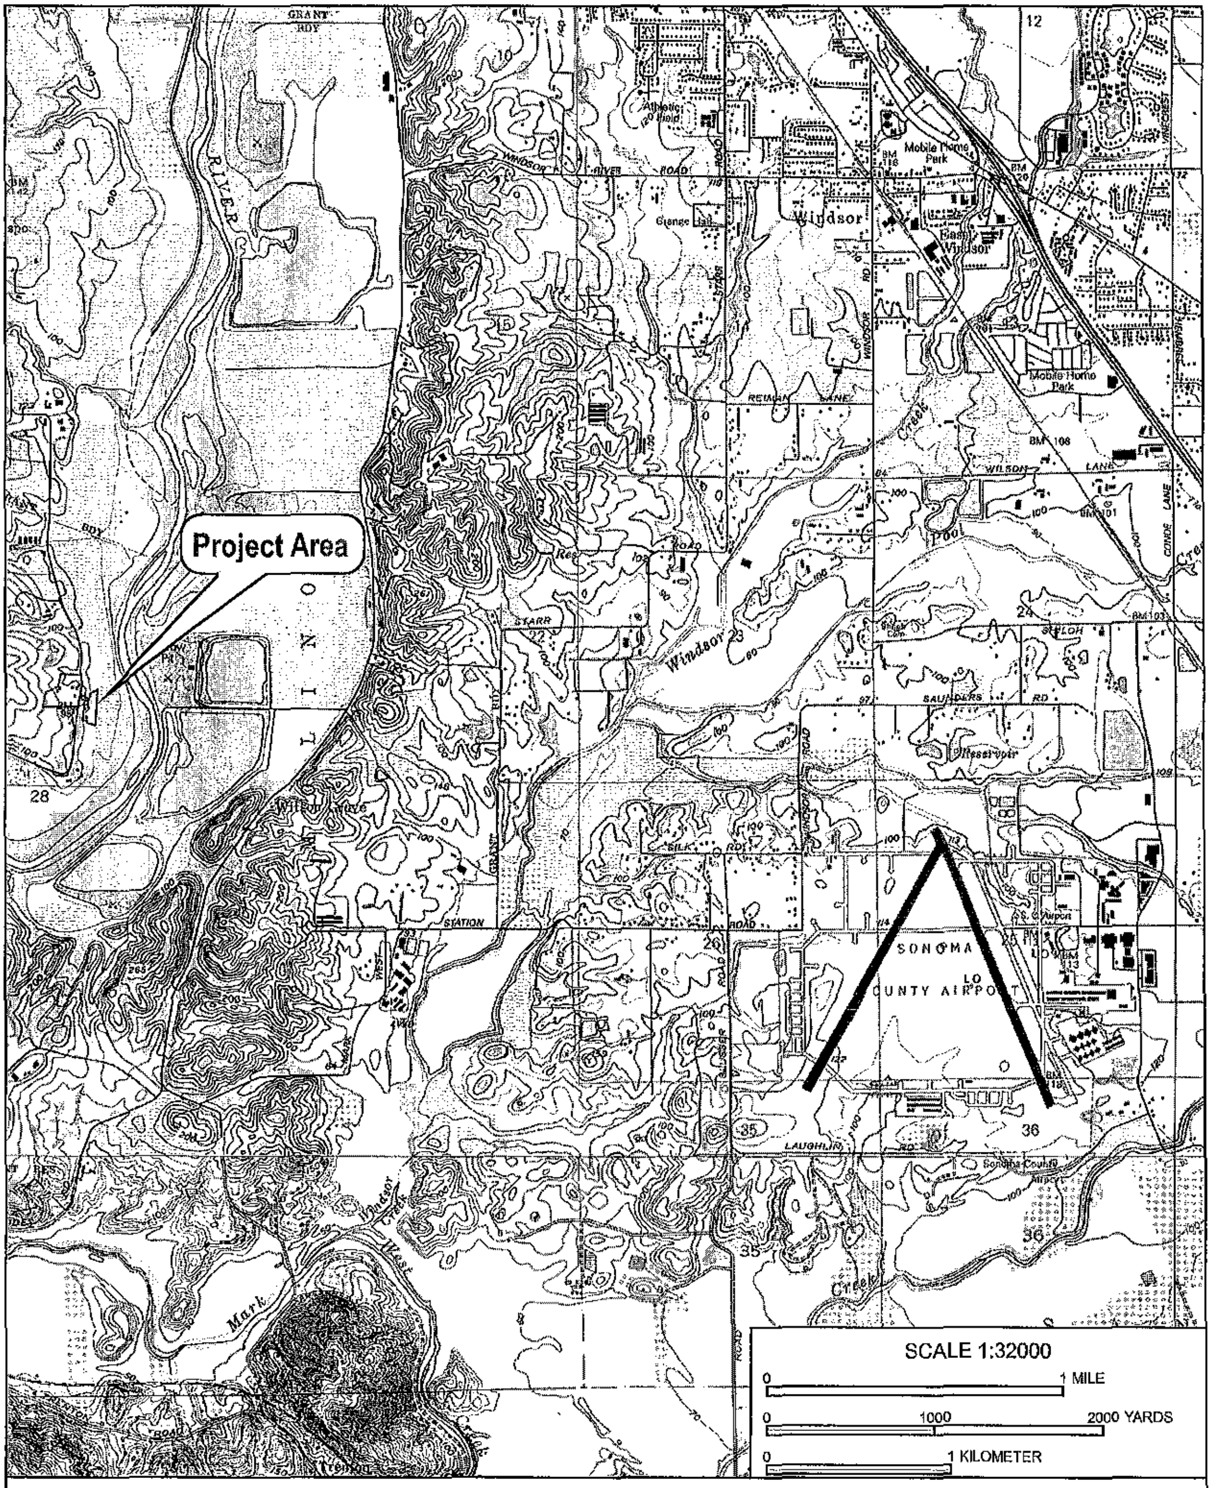
The proposed project site is located in central portion of Sonoma County, within the Dry Creek Valley, located southwest of the City of Healdsburg, west of the Russian River and west of the River Front Regional Park. The project site lies on either side of Westside Road, located north of the confluence of Russian River and Porter Creek (Figure 1).

Proposed Project

The proposed project involves development on the east and west side of Westside Road and is a follows.

West Side: The proposed project is to construct a 60,000-case winery comprised of caves (11,000 to 15, 000 sq. ft.) and in front of the caves, a cut and fill, low profile, 19,100 sq. ft. two story wine building which will not be visible from Westside Road. The existing barn will be refurbished. Access roads and associated parking will also be added to parcel.

East Side: The proposed project is to refurbish an existing 1949 hop kiln barn into a public tasting room, leaving the exterior similar to its currently appearance while maintaining the furnace and ductwork in the



Name: HEALDSBURG

Location: 10 0514513 E, 4263529 N
Figure 1: Project Location

south side. The three story baling barn will be refurbished as a marketing reception area, with equipment storage on the ground level, a kitchen and meeting area for marketing purposes on the mid-level and 2 bedrooms as marketing accommodations on the top level, with two work stations. The two barns will be connected by an elevated walkway. The bailing barn will be refurbished to maintain its current outward appearance. Access roads and associated parking will also be added to parcel.

Table 1: Square footage of structures – 7097 Westside Road

	Square Footage	
Structure	**Existing Surface**	**New Surface**
Entrance Roadway (west)	7,660 (gravel)	
Roadway to winery and parking (west)		31,190
Winery Building (west)		19,100
Wine caves (west)		21,250
Entrance roadway (east)	5,595 (gravel)	2,735
Parking and building access (east)		
Chipseal		10,660
gravel	30,360	13,245
Hop kiln (2 structures)	2,930	190
Baling barn	2,090	20
Concrete walkways		920
Total	48,635	**99,310**

METHODS

Information on special-status plant species was compiled through a review of the literature and database search. Database searches for known occurrences of special-status species focused on the Healdsburg, Guerneville, Camp Meeker and Sebastopol U.S. Geologic Service 7.5-minute topographic quadrangles, which provided a three mile radius around the proposed project area. The following sources were reviewed to determine which special-status plant and wildlife species have been documented in the vicinity of the project site:

- U.S. Fish and Wildlife Service (USFWS) quadrangle species lists (USFWS 2014)
- USFWS list of special-status animals for Sonoma County (USFWS 2014)
- California Natural Diversity Database records (CNDDB) (CDFW 2014)
- California Department of Fish and Wildlife's (CDFW) Special Animals List (CDFW 2014)
- State and Federally Listed Endangered and Threatened Animals of California (CDFW 2014)
- California Native Plant Society (CNPS) Electronic Inventory records (CNPS 2014)
- California Department of Fish and Game (CDFG) publication "California's Wildlife, Volumes I-III" (Zeiner, et al., 1990)
- Sonoma County General Plan 2020, Open Space and Resource Conservation Element (Sonoma County 2008)

Botanical nomenclature used in this report conforms to Baldwin, et al. (2012) for plants and to Sawyer et al. (2009) for vegetation communities. Nomenclature for special-status animal species conforms to CDFW (2013).

Site Survey: Jane Valerius of Jane Valerius Environmental Consulting, and Trish Tatarian, Wildlife Research Associates, conducted a reconnaissance-level wildlife survey and a survey for special status plants of proposed project areas on April 28, 2014, between the hours of 1000 and 1300. Greg Tatarian, Wildlife Research Associates, also conducted a site visit on April 28. An additional site survey to review trees and also conduct special status plant surveys was conducted by Jane Valerius and Trish Tatarian on May 12, 2014.

Plant Surveys: Special status plant surveys were conducted for the development area on April 28 and May 12, 2014. The area to be developed was walked and a list of all plants identifiable at the time of the surveys was recorded (Appendix D). The timing of the surveys was planned to coincide with the flowering period for all of the special status plants that had the potential to occur within the development area based on the presence of potential habitat.

Wildlife Surveys: Exterior surfaces and grounds, and interiors surfaces and spaces of all buildings on the east side proposed for removal and/or refurbishment were surveyed signs of past or present use by bats, including; fecal pellet accumulations, urine staining, fur staining on entry points, live or dead bats, audible calls, and characteristic odor. Surveys were conducted using 10 x 42 roof-prism binoculars supplemented as needed with a 295 Lumens flashlight and an approximately 3,000 Lumens spotlight. All interior building spaces were examined, including the attic spaces.

All trees were assessed for suitable potential habitat for colonial bat species, consisting of cavities, crevices and exfoliating bark. Additionally, foliage habitat suitable for use by obligate tree-roosting, solitary bat species was also assessed. The assessment was conducted using 10 x 42 roof-prism binoculars, with a 295-Lumen flashlight for illuminating potential roost features from the ground. Presence/absence surveys were not conducted

The project area was evaluated for suitable bird nesting habitat using 8 x 42 roof-prism binoculars, noting presence of old bird nests. The reconnaissance-level site visit was intended only as an evaluation of on-site and adjacent habitat types; no special-status species surveys were conducted as part of this effort as winter is not a time of year in which surveys for nesting birds are valid.

EXISTING CONDITIONS

The project area is located within the San Francisco Bay Coastal Bioregion (Welsh 1994). This bioregion is located within central California and encompasses the San Francisco Bay and the Sacramento Delta, extending from the Pacific Ocean to the eastern portion of the tule marsh zone, which is defined by Highway 99 (Welsh 1994). Habitats within this bioregion include both mesic (moist) habitats, such as freshwater marsh, and xeric (dry) habitats, such as chaparral, and are typical of a Mediterranean type climate.

The proposed project site is located within the central western portion of the Healdsburg topographic quadrangle. The parcel lies in southeastern corner of Section 21, on the west side of the Russian River and north of Porter Creek. At this location of the Russian River, the watershed is defined by a western ridge, created by Denner Ridge (600 feet in elevation).

Topographically, the western project site is located on a gently sloping hill that slopes to the east, while the eastern portion of the parcel is within the flatlands of the Russian River.

Of the 75-acre parcel, 42-acres are currently planted in grapes on the east side with a bailing barn, two hop kilns, a small winery residence and small pump house.

On the west side of the road, the parcel comprises 6.5 acres and currently contains a residence, a barn, an open hay and tractor shed, and a 3.5-acre foot reservoir.

Vegetation Communities

Three vegetation community types occur within the project area: *Quercus agrifolia* woodland alliance or coast live oak woodland; ruderal non-native grassland and landscaped areas. There are also existing vineyards adjacent to the project area but they are not part of the proposed project development. There is also a grove of Northern California black walnut (*Juglans hindsii*) in the eastern part of the property near the Russian River. No development is proposed for the black walnut grove other than placement of some picnic tables which would not impact the trees or the non-native grassland understory. A pond located on the west side is within the property boundary but will not be impacted or developed. The pond does support some willow (*Salix* spp.), and other riparian vegetation. The pond was not surveyed as part of the plant surveys.

Quercus agrifolia woodland alliance or cost live oak woodland: Located on the east side, adjacent to Westside Road, is a remnant stand of oak woodland, from what was probably the native vegetation prior to development of the area (Fig. 2). The dominant tree species is coast live oak and includes some valley oak (*Quercus lobata*), black oak (*Quercus kelloggi*), California buckeye *(Aesculus californica)* and California bay laurel (*Umbellularia californica*). A common understory shrub species in this type is poison oak (*Toxicodendron diversilobum*). Understory herbs include miner's lettuce (*Claytonia perfoliata*) and California poppy (*Eschscholzia californica*). Coast live oak woodland occurs in small patches within and adjacent to the property. This type also provides canopy cover for two natural drainages on the east side of the project area. Other than individual oak trees to be removed within the rudral non-native grassland type, the remnant oak woodland stands will not be impacted by the project.

Ruderal grassland: Ruderal grassland is comprised of a variety on non-native grasses and forbs with no one species being dominant. Plant species this type include non-native grasses such as ripgut brome (*Bromus diandrus*), soft chess (*Bromus hordaeceus*), wild oats (*Avena barbata*), European hair grass (*Aira caryophyllea*), ryegrass (*Festuca perennis*), Harding grass (*Phalaris aquatica*), hare barley (*Hordeum murinum* ssp. *leporinum*) and rattail fescue (*Festuca myuros*) along with non-native forb species such as filarees (*Erodium cicutarium, E. botrys*), mayweed (*Anthemis cotula*), scarlet pimpernel (*Anagallis arvensis*), mayweed (*Anthemis cotula*), bindweed (*Convolvulus arvensis*), rough cat's-ear (*Hypochaeris radicata*), mallow (*Malva* sp.), English plantain (*Plantago lanceolata*), mustard (*Brassica nigra, B. rapa*), and wild radish *(Raphanus sativus)*. Within the ruderal grassland are several native tree species including coast live oak (*Quercus agrifolia*), valley oak (*Quercus lobata*) and cottonwood (*Populus fremontii*) (Fig. 3).

Landscaped areas: Landscaped areas include the landscaped yard around the existing residence and buildings. Plant species associated with this type include garden herbs such as sweet allysum (*Lobularia maritima*) and garden iris (*Iris* sp.), garden shrubs such as roses (*Rosa* spp.) along with planted landscape trees such as red oak (*Quercus rubra*), Italian alder (*Alnus cordata*), honey locust (*Gleditsia triacanthos*), fig (*Ficus* sp.), apple (*Malus* sp. and various fruit trees (*Prunus* spp.) as well as native coast redwood (*Sequoia sempervirens*).

Northern California black walnut. A grove of Northern California black walnut trees is located outside of the project area adjacent to the Russian River on the east side of the property. Northern California black walnut (*Juglans hindsii*) is a CNPS Rank 1B species. However, only those trees which are considered truly endemic or native are given a special status. The CNPS Inventory of Rare and Endangered Plants, 8th Edition, provides the following information:

> *Only one confirmed, native occurrence appears viable as of 2003. Widely naturalized in cismontane CA. Threatened by hybridization with orchard trees, urbanization, and conversion to agriculture. Formerly cultivated as rootstock for J. regia, with which it hybridizes readily* (CNPS 2014).

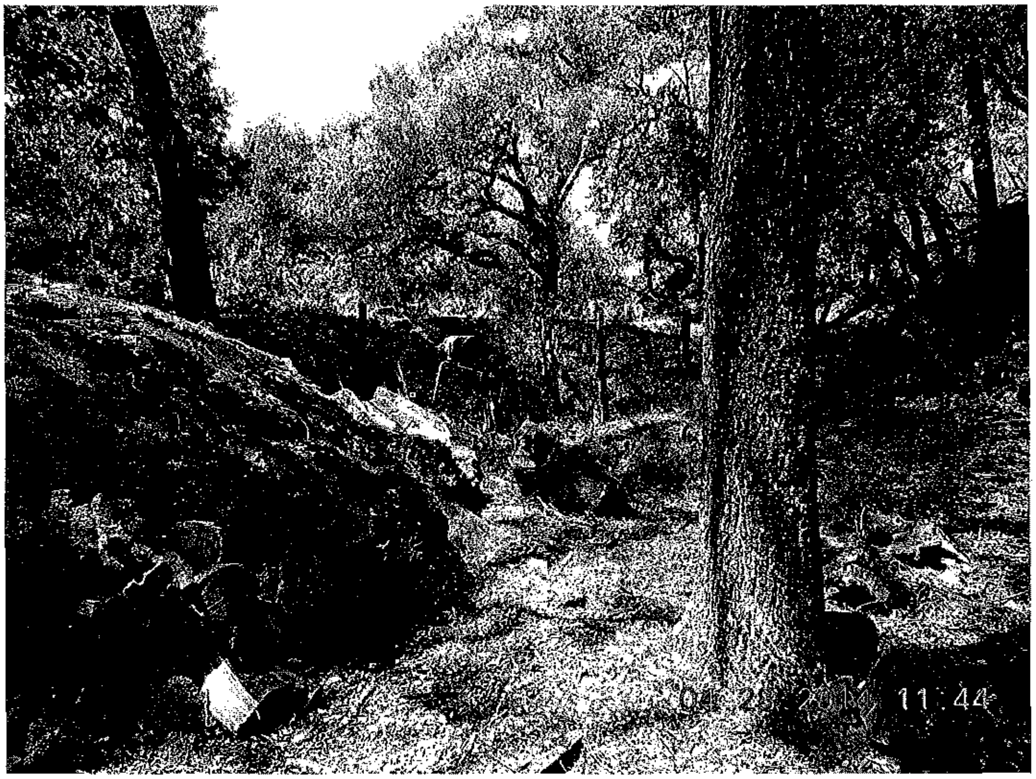

Fig. 2: Coast live oak woodland on east side of Ramey Vineyard.

Fig. 3: Non-native grassland on west side.

Although the grove of walnut trees may be significant it is likely that they are not truly endemic or native which means that they do not qualify as special status. The only plans for this area are to place some picnic tables which would only be used seasonally. The proposed uses, as described by Mr. David Ramey, owner, would not have an adverse impact upon this grove.

Individual Trees. A total of 21 trees are proposed to be removed as part of the project. Several trees are ornamental, including Italian alder (*Alnus cordata*), red oak (*Quercus rubra*), and fruit trees (*Prunus* sp., *Malus* sp.). The majority of trees are native trees and are valley oak (*Quercus lobata*), coast live oak (*Quercus agrifolia*) or cottonwoods (*Populus fremontii*), although the latter were planted as a screen. The coast redwood (*Sequoia sempervirens*) tree is native although it was planted as part of the landscaping for the residence. A total of 6 coast live oak trees, 5 valley oak trees, 4 cottonwood trees and 1 redwood tree would be removed for a total of 15 native trees. The remaining trees are non-native species. A formal tree survey has not been conducted by a certified arborist. The diameter at breast height (dbh) of the trees as shown on the plan maps was also consistently one to two inches smaller than what was measured in April and May 2014. A tree inventory should be conducted by a certified arborist prior to construction of the proposed project.

Table 2: Trees identified for removal, with Diameter at Breast Height (dbh)

	Tree Species	Dbh (inches)*	Location
1	Ornamental	10 + 6	East
2	Italian alder	15	East
3	Italian alder	10	East
4	Coast live oak	11+8+14	West
5	Coast live oak	11+15	West
6	Red oak	21	West
7	Coast redwood	26	West
8	Fruit trees	16	West
9	Valley oak	18	West
10	Valley oak	18	West
11	cottonwood	14	West
12	cottonwood	19	West
13	cottonwood	14	West
14	cottonwood	15	West
15	Coast live oak	7	West
16	Valley oak	7	West
17	Valley oak	42	West
18	Coast live oak	13+6	West
19	Coast live oak	15+12	West
20	Valley oak	9	West
21	Coast live oak	13+11	West

*Note: dbh depicted on the June 19, 2014 Site Plan is likely from 2013. Field surveys conducted in 2014 found 1 inch of growth difference.

Wetlands and Waters of the U.S. and State: There are two natural drainages on the east side of Westside Road. These drainages do not show up as blue line drainages on the USGS quadrangle and do not occur on the west side of the road or property. One drainage is located between the two existing hop kilns and is fed by the roadside ditch that runs along the west side of Westside Rd (see Site Plan). The other natural drainage is south of the proposed barn or south the south hop kiln. A drainage ditch runs along the west side of the existing access road just east of the hop kilns and an agricultural ditch runs along the west side of the existing vineyard east of the hop kilns and buildings. The agricultural ditch is located east of the proposed overflow parking area, between the proposed parking area and existing vineyard. The agricultural ditch supports wetland vegetation and was wet at the time of the May 12, 2014 site visit. Wetland vegetation in the agricultural ditch included meadow barley (*Hordeum brachyantherum*), water plaintain (*Alisma trivale*), umbrella sedge (*Cyperus eragrostis*) and ryegrass (*Festuca perennis*).

All of the drainages and ditches within the project area and on the property potentially qualify as waters of the U.S. as defined by the U.S. Army Corps of Engineers (Corps) and all of these features definitely qualify as waters of the state as defined by the Regional Water Quality Control Board (RWQCB). The natural drainages would also likely fall within the jurisdiction of the California Department of Fish and Wildlife (CDFW), however the roadside and agricultural ditches would probably not fall under CDFW jurisdiction.

A formal delineation of wetlands and waters of the U.S. and state was not conducted for the site as part of this habitat assessment. However, the project has been designed to avoid any impacts to the existing drainages in the project area, therefore a delineation is not required and no permits will be needed from the U. S. Army Corps of Engineers or Regional Water Quality Control Board for placement of fill into wetlands or water.

Wildlife Habitats

The value of a site to wildlife is influenced by a combination of the physical and biological features of the immediate environment. Species diversity is a function of diversity of abiotic and biotic conditions and is greatly affected by human use of the land. The wildlife habitat quality of an area, therefore, is ultimately determined by the type, size, and diversity of vegetation communities present and their degree of disturbance. Wildlife habitats are typically distinguished by vegetation type, with varying combinations of plant species providing different resources for use by wildlife. The following is a discussion of the wildlife species supported by the on-site habitats, as described by *A Guide to Wildlife Habitats of California* (Mayer and Laudenslayer 1988).

Non-native Annual Grassland: Typically this type of habitat provides both primary habitat, such as nesting and foraging, and secondary habitat, such as a movement corridor. Small species using this habitat as primary habitat include reptiles and amphibians, such as southern alligator lizard (*Gerrhonotus multicarinatus*), western fence lizard (*Sceloporus occidentalis*), and Pacific slender salamander (*Batrachoseps attenuatus*), which feed on invertebrates found within and beneath vegetation and boulders within the vegetation community. This habitat also attracts seed-eating and insect-eating species of birds and mammals. California quail (*Lophortyx californicus*), mourning dove (*Zenaidura macroura*), and meadowlark (*Sturnella neglecta*) are a few seed-eaters that nest and forage in grasslands. The close proximity to anthropogenic structures and domestic pets negates the potential for the on-site habitat to support nesting birds.

Individual Trees. Individual trees are foraging and nesting habitat for passerines, and roosting habitat for bats. Smaller passerines, such as black-capped chickadee (*Poecile atricapillus*), bushtit (*Psaltriparus minimus*), plain titmouse (*Baeolophus inornatus*) and acorn woodpecker (*Melanerpes formicivorus*) may nest and forage in the larger trees, feeding on insects on the bark. No large cavities that may support the larger raptors, such as great horned owl (*Bubo virginianus*), were observed in any of the trees. Cavities in the oak trees may provide potential nesting habitat for tree swallows (*Tachycineta bicolor*) and white-breasted nuthatch (*Sitta carolinensis*). Of the 21 trees surveyed, only one had potentially suitable roosting habitat for bats. This tree is located on the west side and is the valley oak with a 42 dbh (Fig. 4).

Bats that use trees fall into three categories: 1) solitary, obligate tree-roosting bats that roost in the foliage or bark such as Western red-bat (*Lasiurus blossevillii*), a California Species of Special Concern (SSC), or hoary bat (*Lasiurus cinereus*); 2) colonial tree-roosting bats that form groups of varying size in tree cavities or beneath exfoliating bark, such as silver-haired bats (*Lasionycteris noctivagans*), and 3) more versatile bat species that will use a wide variety of roosts from buildings to bridges to trees, such as various *Myotis* species, pallid bat (*Antrozous pallidus*), another SSC species, and others.

Solitary-roosting bats consist either of females either alone or with young, or solitary males. Colonial-roosting bats may form maternity colonies in tree cavities or crevices, caves, mines, bridges, or other man-made structures. During the day, these roosts provide shelter and protection for adult females and their young, which remain in the roost while females forage at night, returning to nurse and care for their young. Greater impacts to bats can occur as a result of removal of trees that support cavity-roosting bat species than those that provide habitat for solitary foliage-roosting species.

Buildings: Six structures were evaluated for this Habitat Assessment, the large barn, the wood-sided southern hop barn, wood-sided northern hop barn, wood-sided small farmhouse (residence), metal-sided chicken building, and wood-sided pump storage barn. As stated above, many colonial bat species have adapted to using man-made structures such as houses, barns, sheds, garages, bridges, and culverts. Statewide and in the project region, buildings provide significant roosting habitat for bat species, including more common species such as Brazilian free-tailed bat (*Tadarida brasiliensis*) and Yuma myotis (*Myotis yumanensis*), as well as more rare species such as pallid bat (*Antrozous pallidus*), a California Species of Special Concern (SSC) and Townsend's big-eared bat (*Corynorhinus townsendii*), proposed for listing as Endangered by the CDFW. Please see Special Status Species Section for more details on *C. townsendii.*

In general, day roost habitat is considered more critical than night roost habitat, because it provides shelter for bats from light, air currents, predators, and other disturbance, and are where bats mate, raise young, roost during dispersal, and overwinter, either in torpor or hibernation. Because of this, and because demolition typically occurs during daytime hours, the risks of direct mortality of bats is very high at day roosts. Although night roosts are also very important for bats for various purposes (conservation of energy during foraging bouts, social interaction, etc.), buildings are not usually demolished at night, so although the habitat is lost, direct mortality does not usually occur.

Montane hardwood: This wildlife habitat type includes Coast live oak woodland. The woodlands provide habitat for a variety of species, including refugia for reptiles, such as ring-necked snake (*Diadophis punctatus*), amphibians, such as the Pacific slender salamander (*Batrachoseps attenuatus*) and arboreal salamander (*Aneides lugubris*), foraging and nesting habitat for passerines, and roosting habitat for bats. Smaller passerines, such as black-capped chickadee (*Poecile atricapillus*), bushtit (*Psaltriparus minimus*), oak titmouse (*Baeolophus inornatus*) and downy woodpecker (*Picoides pubescens*) observed on the site may nest and forage in the woodlands, feeding on insects on the bark.

Perennial Pond: Although outside the proposed project footprint, this pond is within 120 feet of the proposed driveway. Species observed in the pond include non-native mosquitofish (*Gambusia affinis*), and eastern bullfrog (*Lithobates catesbeianus*). A daytime survey of the pond revealed 52 adult bullfrogs and a high population of tadpoles. Native species observed were Sierran treefrogs (*Pseudacris sierra*) (Fig. 5).

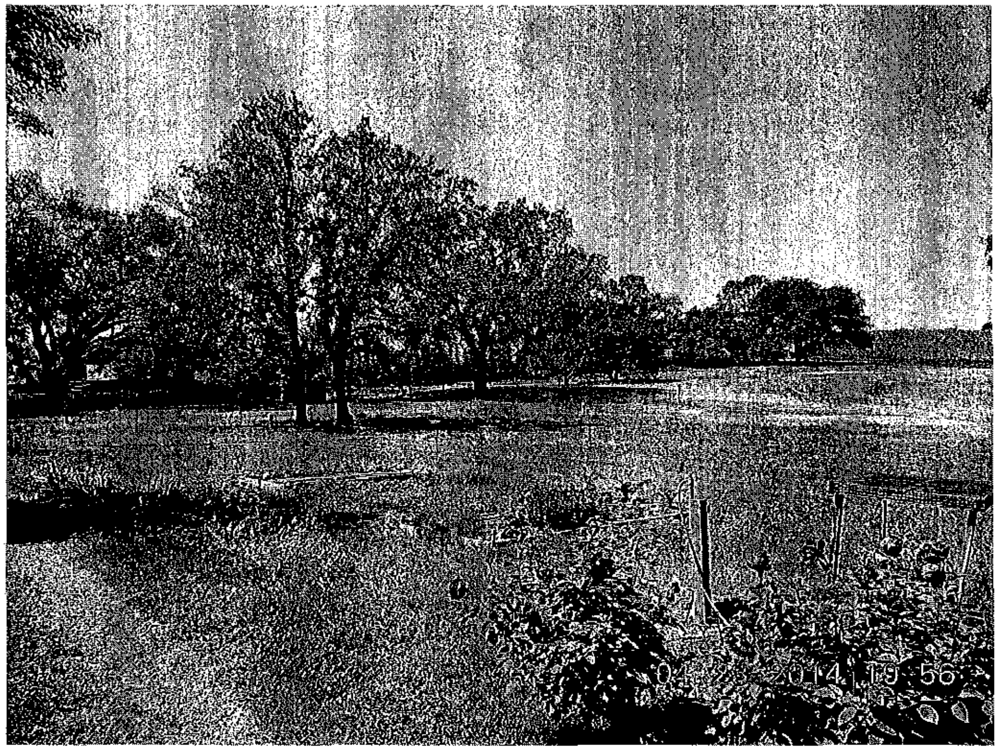

Fig. 4: Oak trees on the west side of the proposed project area.

Fig. 5: Perennial pond located outside the project area.

Movement Corridors

Wildlife movement includes migration (i.e., usually one way per season), inter-population movement (i.e., long-term genetic flow) and small travel pathways (i.e., daily movement corridors within an animal's territory). While small travel pathways usually facilitate movement for daily home range activities such as foraging or escape from predators, they also provide connection between outlying populations and the main corridor, permitting an increase in gene flow among populations.

These linkages among habitat types can extend for miles between primary habitat areas and occur on a large scale throughout California. Habitat linkages facilitate movement among populations located in discrete areas and populations located within larger habitat areas. The mosaic of habitats found within a large-scale landscape results in wildlife populations that consist of discrete sub-populations comprising a large single population, which is often referred to as a meta-population. Even where patches of pristine habitat are fragmented, such as occurs with coastal scrub, the movement between wildlife populations is facilitated through habitat linkages, migration corridors and movement corridors. Depending on the condition of the corridor, genetic flow between populations may be high in frequency, thus allowing high genetic diversity within the population, or may be low in frequency. Potentially low frequency genetic flow may lead to complete isolation, and if pressures are strong, potential extinction (McCullough 1996; Whittaker 1998).

Wildlife connectivity of this site to other open lands in the area can occur through the vineyards and undeveloped lands. There are no barriers to movement between the pond on the site and ponds located further west. Westside Road is likely not a barrier to movement based on the rate of traffic after the wineries and tasting rooms have closed their doors. As a result, animals are likely able to move across the road at dusk and night without the mortality from traffic.

SPECIAL-STATUS BIOLOGICAL RESOURCES

Certain vegetation communities, and plant and animal species are designated as having special-status based on their overall rarity, endangerment, restricted distribution, and/or unique habitat requirements. In general, special-status is a combination of these factors that leads to the designation of a species as sensitive. The Federal Endangered Species Act (FESA) outlines the procedures whereby species are listed as endangered or threatened and established a program for the conservation of such species and the habitats in which they occur. The California Endangered Species Act (CESA) amends the California Fish and Wildlife Code to protect species deemed to be locally endangered and essentially expands the number of species protected under the FESA.

Special-status Vegetation Communities

Sensitive natural communities are those that are considered rare in the region, may support special-status plant or wildlife species, or may receive regulatory protection (i.e., through Section 404 of the Clean Water Act [CWA] and/or Sections 1600 et seq. of the California Fish and Wildlife Code). Please refer to Appendix A for detailed descriptions of waters and wetlands. In addition, sensitive natural communities include plant communities that have been identified as having highest inventory priority in the California Natural Diversity Database (CNDDB). The second edition of *A Manual of California Vegetation* (Sawyer, et al. 2009) also provides the rarity ranking status of these communities. No sensitive natural communities occur within the proposed project area. The Northern California black walnut grove, located on the eastern side of the property, is not considered to be a native occurrence. As a result, it does not qualify as a special-status vegetation community nor are the individual trees considered to be special status. However, no work is proposed in this area and the grove will be preserved.

Special-status Plant Species

Special-status plant species are those species that are legally protected under the federal Endangered Species Act (ESA) and/or the California Endangered Species Act (CESA) as listed or proposed for listing as threatened or endangered, as well as species that are considered rare by the scientific community. For example, the California Native Plant Society (CNPS) has identified some species as List 1 or 2 species and may be considered rare or endangered pursuant to Section 15380(b) of the State CEQA Guidelines. The CDFW has compiled a list of "Special Plants" (CDFW 2014), which include California Special Concern species. These designations are given to those plant species whose vegetation communities are seriously threatened. Although these species may be abundant elsewhere they are considered to be at some risk of extinction in California. Although Special Concern species are afforded no official legal status under FESA or CESA, they may receive special consideration during the planning stages of certain development projects and adverse impacts may be deemed significant under the California Environmental Quality Act (CEQA).

A total of 58 special-status plant species have been reported occurring on the four topographic quadrangles (CNDDB 2014). Please refer to Appendix B for a list of these species and their potential for occurrence. Those species that occur in freshwater marshes and swamps, riparian scrub, broadleafed upland forest, chaparral, cismontane woodland, closed-cone coniferous forest, vernal pools, bogs and fens, coastal scrub, meadows and seeps, North Coast coniferous forest, coastal prairie, coastal bluff scrub or plants that occur on serpentinite or other substrates not occurring within the project area were considered to not have the potential to occur. Species associated with valley and foothill grassland could potentially occur on the site but not of these species were observed during the appropriately timed special status plant surveys in April and May. The property on the east side was a pumpkin patch and farm store starting in 1989 and then became vineyards. The property on the west side has been a residence with landscaped yard and garden. The grassland communities in the project area are highly disturbed and dominated by weedy, non-native species. No special-status plants are likely to occur within the proposed project area and none were observed.

Special-status Animal Species
Special-status animal species include those listed by the USFWS (2013) and the CDFW (2013). The USFWS officially lists species as either Threatened or Endangered, and as candidates for listing. Additional species receive federal protection under the Bald Eagle Protection Act *(e.g.*, bald eagle, golden eagle), the Migratory Bird Treaty Act (MBTA), and state protection under CEQA Section 15380(d). In addition, many other species are considered by the CDFW to be species of special concern; these are listed in Remsen (1978), Williams (1986), and Jennings and Hayes (1994). Although such species are afforded no official legal status, they may receive special consideration during the planning and CEQA review stages of certain development projects. The CDFW further classifies some species under the following categories: "fully protected", "protected fur-bearer", "protected amphibian", and "protected reptile". The designation "protected" indicates that a species may not be taken or possessed except under special permit from the CDFW; "fully protected" indicates that a species can be taken for scientific purposes by permit only.

Of the 20 special-status animal species identified as potentially occurring in the vicinity of the project area, including within a 3 mile radius (CNDDB 2014), several additional species were evaluated for their potential to occur within the study area, based on: 1) review of the CNDDB, 2) the "Special Animals" list (CDFW 2014) that includes those wildlife species whose breeding populations are in serious decline, and 3) the habitat present on site. See Appendix C for a list of the 26 species evaluated. Several of these species have a high potential for occurrence at the project site and are discussed below. This document does not address impacts to species that may occur in the region but for which no habitat occurs on site.

California red-legged frog (*Rana draytonii*) (CRF), listed by the USFWS as Threatened and is classified by the CDFW as a California Special Concern species and a Fully Protected Species under Fish and Game Code 5050, breeds primarily in ponds, but will also breed in slow-moving streams, or deep pools in intermittent streams. Inhabited ponds are typically permanent, at least 2 feet (0.6 meters) in depth, and contain emergent and shoreline vegetation. Sufficient pond depth and shoreline cover are both critical, because they provide means of escape from predators and high winter flooding of stream habitat for the frogs (Stebbins 1985, Tatarian 2008).

Project Area Occurrence: No surveys were conducted for this species as part of this habitat assessment. The pond structure and hydrology provides suitable breeding habitat for this species. However, the presence of adult bullfrogs, the high population (52 adults and thousands of tadpoles) reduces the suitability of the pond.

Laboratory experiments have clarified the effects bullfrogs and mosquitofish have on CRF (Lawler, *et al.* 1999). Under natural conditions, the presence of bullfrog tadpoles nearly precluded the recruitment of CRF tadpoles to the juvenile stage. Mosquitofish, however, with a variety of prey items and spatially complex escape areas available, do not affect the recruitment of CRF tadpoles. However, in those ponds with both species occurring in high numbers, such as the pond on-site, the potential for CRF to occur is low to none. The effects of introduced predators on the survival of CRFs are largely related to the relative population sizes of the predators, the quality and amount of aquatic habitat, and the CRF. Specifically, CRFs and introduced predators can coexist if the number of predators remains small compared to the number of CRFs and habitats provide refugia for CRF from excessive predation. No CRF were detected during the daytime survey. A nocturnal survey would provide the best way of determining presence. The high population of bullfrogs likely precludes CRFs at this pond. As a result, this species has a low potential for occurrence in this portion of Dry Creek Valley and the pond on-site. The nearest reported presence occurrs more than 3 miles west of the project area in Austin Creek (CNDDB 2014).

Foothill yellow-legged frog (*Rana boylii*) is a California Special Concern species, and occurs in most Pacific drainages from Oregon to Los Angeles County. The species typically inhabits perennial rocky streams, preferring streams with cobble-sized substrates (Jennings and Hayes 1994). Occupied drainages range from sea level to 2,040 meters (6,700 feet) (Jennings and Hayes 1994). Streams in woodland, chaparral or forest with little-to-no bank vegetation cover are also preferred (Stebbins 1985). Breeding occurs from mid-March to May, depending on rains, with tadpoles metamorphosing in June or July.

Project Area Occurrence: No surveys were conducted for this species as part of this habitat assessment. This species is not expected to occur in the pond. This species has been reported occurring approximately 1.2 miles west of the project area in Porter Creek (CNDDB 2014).

Western pond turtle (*Emys marmorata*) is listed by the CDFW as a California Special Concern species. It originally inhabited many of the pacific drainage basins in California (Stebbins 1985). This medium sized turtle ranges in size to just over 8 inches (21cm) with a low carapace that is generally olive, brownish or blackish (Stebbins 1985, Jennings and Hayes 1994). Primary habitats include permanent water sources such as ponds, streams and rivers. It is often seen basking on logs, mud banks or mats of vegetation, although wild populations are wary and individuals will often plunge for cover after detecting movement from a considerable distance. Although it is an aquatic species with webbed feet, it can move across land in response to fluctuating water level, an apparent adaptation to the variable rainfall and unpredictable flows that occur in many coastal California drainage basins (Rathbun, *et al.* 1992).

Project Area Occurrence: No surveys were conducted for this species as part of this habitat assessment. This species is expected to occur within the pond on-site. This species has been reported occurring less than 1 mile east of the project area in the Russian River (CNDDB 2014).

Nesting Passerines: As stated previously, passerines, protected under the MBTA and Fish and Wildlife Code 3503, have potential to nest within the proposed project area. Bird species potentially nesting in the riparian area include tree swallows (*Tachycineta bicolor*), bushtit (*Psaltriparus minimus*) and oak titmouse (*Baeolophus inornatus*) that glean insects from the bark. As early as February, passerines begin courtship and once paired, they begin nest building, often around the beginning of March. Nest structures vary in shapes, sizes and composition and can include stick nests, mud nests, matted reeds and cavity nests. For example, black phoebes may build a stick nest under the eaves of a building. Depending on environmental conditions, young birds may fledge from the nest as early as May and, if the prey base is large, the adults may lay a second clutch of eggs.

Project Area Occurrence: No surveys were conducted for these species as part of this habitat assessment. Several passerine (perching birds) species may nest on the site in the various habitats, including, but not limited to, white-breasted nuthatch in the oak trees. A nesting bird survey shall be conducted before removal of any of these habitats, and seasonal restrictions put into place for occupied habitats, to ensure no take of individuals will occur.

Nesting Raptors: As with passerines, raptors (birds of prey), such as red-shouldered hawk (*Buteo lineatus*), cooper's hawk (*Accipiter cooperii*), are protected under the Federal Migratory Bird Treaty Act and Fish and Wildlife Code 3503.5

General Ecology and Distribution: Raptors nest in a variety of substrates including, cavities, ledges and stick nests. For example, Cooper's hawks are small bird hunters, hunting on the edges of forests in broken forest and grassland habitats where passerines forage for seeds and insects. Nests occur in heavily forested areas near a water source. Research sites on nesting Cooper's hawks rarely show the nests more than a quarter of a mile away from water, whether it is a cattle tank, stream or seep (Snyder and Snyder 1975). Trees typically used by Cooper's hawks include coast live oaks, cottonwoods, and black oaks (Call 1978), as well as second growth conifer stands or deciduous riparian areas. In general, the breeding season for raptors occurs in late March through June, depending on the climate, with young fledging by early August.

Project Area Occurrence: No surveys were conducted for these species as part of this habitat assessment. No nests were detected at the time of the survey. However, nest structures could be developed before the project goes to construction and the trees are removed.

Roosting bats – including Townsend's big-eared bat[1] (*Corynorhinus townsendii*), pallid bat[2] (*Antrozous pallidus*), western red bat (*Lasiurus blossevillii*) and hoary bat[2] (*Lasiurus cinereus*).

Status: [1]Proposed for listing as Endangered or Threatened by CDFW, [2]State Species of Concern (SSC), as well as Fish and Wildlife Code Sections 86, 2000, 2014, 3007, Title 14, Sections 15380, 15382.

General Ecology and Distribution: Bats in this region of California are not active year-round. During the maternity season, non-volant young of colonial bats remain in the roost until late summer (end of August), after which they may disperse from the natal roost or remain into or throughout the winter. Obligate tree-roosting bat species, and to some extent, colonial bats, may switch tree roosts frequently, particularly after young are volant, but are sometimes faithful for longer periods (weeks). During winter months, bats typically enter torpor, rousing only occasionally to drink water or opportunistically feed on insects. The onset of torpor is dependent upon environmental conditions, primarily temperature and rainfall. To prevent direct mortality of either non-volant young or torpid bats during winter months, roosts must not be disturbed or destroyed until bats are seasonally active, and only after they have been provide a means of escape from the roost.

Townsend's big-eared bats have been proposed for listing as either Endangered or Threatened by the California Fish and Wildlife Commission. During the one-year public comment and review process, the species receives the same protections as a fully listed species.

Townsend's big-eared bats are found unevenly throughout most of the state from sea level to the Sierras, but are more restricted in their roost habitat selection, and more sensitive to human disturbance. This species is more strongly associated with cave and mine habitat, preferring large, open roosts, compared to smaller cavities or crevices. In addition to cave and mine roosts, this species uses buildings, bridges and culverts, and there is some evidence that very large redwood tree basal hollows have been used. Roosts for this nomadic species may serve multiple functions throughout the year, and multiple sites may be used for different life stages (pregnancy, parturition, rearing, etc.). Males remain solitary during maternity season.

Pallid bats, an SSC species, are eclectic in their roosting habitat selection, and to some extent distribution, and can be found in crevices and small cavities in rock outcrops, tree hollows, mines, caves, and a wide variety of man-made structures such as buildings, bridges and culverts, generally in lower to mid-elevation sites. This species forms maternity colonies, composed of dozens to sometimes hundreds of females and their young, and smaller bachelor colonies composed of males and not-yet reproductive females.

Western red bats, an SSC species, have a broad, but disjunct, distribution throughout the state, and a wide range of elevations. Reproductive females are more common in the inland portions of the state than the Bay Area, where males are more common during the summer months. This is a foliage-roosting species typically associated with large-leaf trees, such as willows, cottonwoods, and sycamores, and is often found near riparian zones. Western red bats are typically solitary, however females give birth to two to five young, which is atypical compared to other bat species.

Project Area Occurrence: Buildings: Pallid bats and Townsend's big-eared bats have potential to roost in the structures located on the project site. Two non-SSC bat species, Yuma Myotis (*Myotis yumanensis*) and Brazilian free-tailed bats (*Tadarida braziliensis*) were found in several of the on-site buildings during the 2014 season (See Table 3).

Table 3: Structures Proposed for Renovation and their Potential Suitability for Roosting Bats

Structure	Site Location	Type of Roost	Signs Observed
Large baling barn	East (southern portion)	Maternity Day Roost – loft and lower floor Night Roost – loft and lower floor	Large amounts of fecal pellets widely distributed throughout lower floor areas, lower floor loft, and loft above. Large numbers (ca. 200) *Myotis yumanensis* roosting in frame gaps of wood hop cars and ca. 50 *Tadarida brasiliensis* at roof ridge beams. Appears to be a long-term maternity day roost.
Hop Barn (southern)	East (central portion)	Day Roost, possibly maternity – roof rafters and skip-sheathing gaps Night Roost – open areas in upper and lower floors	No bats observed during assessment, but small crevices could hid bat, probably *Myotis yumanensis* or other small *Myotis* species. Moderate amounts of bat fecal pellets on loft floor and lower floor ground.
Hop Barn (northern)	East (central portion)	Day Roost, possibly maternity – roof rafters and skip-sheathing gaps Night Roost – open areas in upper and lower floors	No bats observed during assessment, but small crevices could hid bat, probably *Myotis yumanensis* or other small *Myotis* species. Moderate amounts of bat fecal pellets on loft floor and lower floor ground.
Small farm house	East (central portion)	Maternity Day Roost – roof soffit, rafters Night Roost – while raising pups	Observed ca. 10 *Myotis yumanensis* roosting in enclosed soffit, more likely present but not visible.
Chicken shed	East (south portion)	None	None
Pump storage barn	East (central portion)	None	None

Large Barn: The large barn, constructed of wood with horizontal siding boards and corrugated metal roof, is in poor condition with many exterior siding boards missing or peeling away, providing many suitable entry points and roost areas. The structure contained extensive evidence of both day and night roosting activity in the lower floor. Bats have been roosting from floor joists, ceiling fixtures, wall joists, gaps in header beams, and other locations throughout. Most of the evidence in the lower floor appears to be the result of night-roosting activity, however the second floor and upper floor loft area contain evidence of day-roosting activity, and approximately 200 Yuma myotis (*Myotis yumanensis*) were observed roosting in crevices in the frames of the hop cars located on rails in the loft, and ca. 50 Brazilian free-tailed bats (*Tadarida brasiliensis*) were observed roosting in the gap between the paired ridge beams of the roof, beneath the corrugated metal roofing material. This building provides maternity day roost habitat, and likely has done so for many years, based on extensive fecal and urine staining evidence throughout. Several photos are included in this report showing this roosting activity. There were additional cavities between exterior wall siding and interior wood panels that could provide roost habitat, but were not able to be surveyed at the time of our assessment.

Though not SSC species, large colonies of Brazilian free-tailed or Yuma myotis often occupy a roost, and significant impact to local breeding populations could occur if buildings are demolished without first conducting humane bat eviction or other appropriate measures.

Hop Barns: Both of these wood-sided/shingle-roof structures are in poor condition, with the south barn roof almost entirely missing, and exterior siding peeling and missing. Both structures contain suitable day and/or night roost habitat to varying degrees. Evidence of use by Brazilian free-tailed bats (*Tadarida brasiliensis*) and Yuma myotis (*Myotis yumanensis*) was present in the upper floor areas on the slotted flooring, walls, and gaps between skip-sheathing and roofing materials. In addition, a wad of cloth sacks was suspended from the roof rafters in the south barn, and a metal pulley hanging from the wall of the north barn both provided roost habitat for bats, based on fecal accumulations below. The lower floors, mostly open, could provide suitable night roost habitat, but appear too cold and damp for day roost activity.

Small Farm House (Residence): This wood-sided, single-story residence with attached shed roofs and patios has finished interior ceilings, and enclosed soffits at the gable ends. The building is in good condition, however, there are numerous potential openings into wall and roof sections. Approximately 10 *Myotis yumanensis* were observed inside the soffit cavity, and evidence of long-term use was observed. This structure is providing maternity day roost habitat, as well as night roost habitat for nursing female bats.

Chicken Shed: This corrugated metal-sided building with wood framing is too open to provide suitable roost habitat, other than for occasional, individual bats. No evidence of past or present roosting activity was observed.

Pump/Storage Barn: No evidence of past or present roosting activity was observed, however this building could provide habitat for day or night roosting bats if left undisturbed (the building is currently actively used for storage), and/or during bat exclusion/eviction from the barn structures.

Please refer to the Impacts and Mitigation Measures for details on avoidance measures of roosting bats in buildings on this site.

Trees: One valley oak tree on the western portion of the project site contained suitable potential cavity and crevice roost habitat. SSC bat species such as pallid bats, as well as non-SSC species have potential to roost in cavities and exfoliating bark observed in this tree.

Other larger mature trees throughout the project site proposed for removal may also support non-SSC bats such as western red bat (Lasiurus blossevillii), as well as hoary bats (*Lasiurus cinereus*), both obligate tree-roosting solitary bat species.

Please refer to the Impacts and Mitigation Measures for details on avoidance measures of roosting bats in trees on this site.

IMPACTS AND MITIGATION MEASURES

This section summarizes the potential temporary biological impacts from construction activities within the study area. The analysis of these impacts is based on a single reconnaissance-level survey of the study area, a review of existing databases and literature, and personal professional experience with biological resources of the region.

CEQA Guidelines Sections 15206 and 15380 were used to determine impact significance. Impacts are generally considered less than significant if the habitats and species affected are common and widespread in the region and the state.

A species may be treated as rare or endangered even if it has not been listed under CESA or FESA. Species are designated endangered when it survival and reproduction in the wild are in immediate jeopardy from one or more causes, including loss of habitat, change in habitat, overexploitation, disease or other factors.

For the purposes of this report, three principal components in the evaluation were considered:

- Magnitude of the impact (e.g., substantial/not substantial)
- Uniqueness of the affected resource (rarity)
- Susceptibility of the affected resource to disturbance (sensitivity)

The evaluation of significance must consider the interrelationship of these three components. For example, a relatively small-magnitude impact (e.g., disturbing a nest) to a state or federally listed species would be considered significant because the species is at low population levels and is presumed to be susceptible to disturbance. Conversely, a common habitat such as non-native grassland is not necessarily rare or sensitive to disturbance. Therefore, a much larger magnitude of impact (e.g., removal of extensive vegetation) would be required for it to be considered a significant impact.

Trees

Impacts: A total of 21 trees are proposed for removal as part of the proposed project. This includes 6 coast live oaks, 5 valley oaks, 4 cottonwoods and one redwood, all of which are native trees. The Sonoma County Tree Protection Ordinance General Provisions state:

> *Projects shall be designed to minimize the destruction of protected trees. With development permits, a site plan shall be submitted that depicts the location of all protected trees greater than nine inches (9") and their protected perimeters in areas that will be impacted by the proposed development, such as the building envelopes, access roads, leachfields, etc.*

Protected trees are defined as:

> *"Protected tree" means* Big Leaf Maple *Acer macrophyllum,* Black Oak *Quercus Kelloggii,* Blue Oak *Quercus Douglassi,* Coast Live Oak *Quercus agrifolia,* Interior Live Oak *Quercus Wislizenii,* Madrone *Arbutus Menziesii,* Oracle Oak *Quercus morehus,* Oregon Oak *Quercus Garryana,* Redwood *Sequoia sempervirens,* Valley Oak *Quercus lobata,* California Bay *Umbellularia California, and their hybrids.*
>
> *"Protected tree of special significance" means Quercus lobata* Valley Oak.

The Tree Protection Ordinance also states:

> *The Valley Oak-Quercus lobata shall receive special consideration in the design review process to the extent that mature specimens shall be retained to the fullest extent feasible. Valley Oaks contribute greatly to Sonoma County's visual character, landscape and they provide important visual relief in urban settings. On existing parcels created without the benefit of an accompanying*

> *EIR, design review shall focus on the preservation of Valley Oaks to the fullest extent feasible. Where such preservation would render a lot unbuildable, partial protection with accompanying appropriate mitigations developed by a certified arborist shall be incorporated into the project design. In such cases where only partial protection can be achieved, full replacement in accordance with the arboreal value chart shall be required.*

Mitigation Measure: The project will comply with the County's Tree Protection Ordinance. Compensation for the loss of native trees is provided in the ordinance and is based on arboreal values. The ordinance requires one hundred percent (100%) replacement of trees or payment of in-lieu fees. It is recommended that a certified arborist conduct a tree survey and inventory as part of the analysis of impacts for the project.

The County ordinance also requires that:

> *Before the start of any clearing, excavation, construction or other work on the site, every tree designated for protection on the approved site plan shall be clearly delineated with a substantial barrier (steel posts and barbed wire or chain link fencing) at the protected perimeter, or limits established during the permit process. The delineation markers shall remain in place for the duration of all work. All trees to be removed shall be clearly marked. A scheme shall be established for the removal and disposal of brush, earth and other debris as to avoid injury to any protected tree.*
>
> *Where proposed development or other site work must encroach upon the protected perimeter of a protected tree, special measures shall be incorporated to allow the roots to obtain oxygen, water and nutrients. Tree wells or other techniques may be used where advisable. No changes in existing ground level shall occur within the protected perimeter unless a drainage and aeration scheme approved by a certified arborist is utilized. No burning or use of equipment with an open flame shall occur near or within the protected perimeter (except for authorized controlled burns).*
>
> *No storage or dumping of oil, gasoline, chemicals or other substances that may be harmful to trees shall occur within the drip line of any tree, or any other location on the site from which such substances might enter the drip line.*
>
> *If any damage to a protected tree should occur during or as a result of work on the site, the County shall be promptly notified of such damage. If a protected tree is damaged so that it cannot be preserved in a healthy state, the planning director shall require replacement in accordance with the arboreal value chart. If on-site replacement is not feasible, the applicant shall pay the in-lieu fee to the tree replacement fund.*
>
> *The following design standards for protected trees shall be adhered to:*
>
> *Underground trenching for utilities should avoid tree roots within the protected perimeter. If avoidance is impractical, tunnels should be made below major roots. If tunnels are impractical and cutting roots is required, it shall be done by hand-sawn cuts after hand digging trenches. Trenches should be consolidated to serve as many units as possible.*
>
> *Compaction within the drip line or protected perimeter shall be avoided.*
>
> *Paving with either concrete or asphalt over the protected perimeter should be avoided. If paving over the protected perimeter cannot be avoided, affected trees shall be treated as removed for purposes of calculating arboreal values.*
>
> *Wherever possible, septic systems and/or leachlines shall not be located on the uphill side of a protected tree.*

> *Security posted for the purpose of insuring the proper construction of public or private improvements shall also include an amount sufficient to secure any requirements imposed pursuant to this section. In addition, security for potential tree damage shall be twenty-five percent (25%) of the amount posted for planned tree replacement. In lieu fees shall be paid prior to recording any maps. Such security shall not be released until protection requirements, including planting replacement trees, and any long term maintenance requirements have been satisfactorily discharged. The initial bond amount may be reduced to cover only the maintenance and replacement of trees after construction is completed.*

Birds

Impact: Several passerine (perching birds) species observed on site, such as California towhee and scrub jays, build stick nests in trees and shrubs, while others, such as the white-breasted nuthatch and chestnut-backed chickadee, nest in tree cavities. Disturbance during the nesting season (February 15- August 15) may result in the potential nest abandonment and mortality of young, which is considered a "take" of an individual. However, many of the species observed on the site were fledged juveniles from this year, which means that the nesting season has concluded in the project area.

Mitigation Measure: The following mitigation measures should be followed in order to avoid or minimize impacts to passerines and raptors that may potentially nest in the trees:

1) Grading or removal of nesting trees should be conducted outside the nesting season, which occurs between approximately February 15 and August 15.
2) If grading between August 15 and February 15 is infeasible and groundbreaking must occur within the nesting season, a pre-construction nesting bird (both passerine and raptor) survey of the grasslands and adjacent trees shall be performed by a qualified biologist within 7 days of ground breaking. If no nesting birds are observed no further action is required and grading shall occur within one week of the survey to prevent "take" of individual birds that could begin nesting after the survey.
3) If active bird nests (either passerine and/or raptor) are observed during the pre-construction survey, a disturbance-free buffer zone shall be established around the nest tree(s) until the young have fledged, as determined by a qualified biologist.
4) The radius of the required buffer zone can vary depending on the species, (i.e., 75-100 feet for passerines and 200-300 feet for raptors), with the dimensions of any required buffer zones to be determined by a qualified biologist in consultation with CDFW.
5) To delineate the buffer zone around a nesting tree, orange construction fencing shall be placed at the specified radius from the base of the tree within which no machinery or workers shall intrude.
6) After the fencing is in place there will be no restrictions on grading or construction activities outside the prescribed buffer zones.

Mammals

Impact: Renovation of buildings may cause direct mortality of roosting bats that use the structures, if the structures are removed during seasonal periods of inactivity (maternity season or winter), or without first conducting humane bat eviction or partial dismantling under supervision of a qualified bat biologist experienced with bats using man-made roosts.

Preventing Take of Bats in Buildings – General Discussion

In the case of buildings to be demolished for redevelopment, there are only two effective methods for getting bats out of the structure. The first, utilized mainly when the building is in good condition or will not be demolished, and the work is feasible, is "humane eviction", or "bat exclusion", which relies on the bats' ability to fly out of the roost. In this method, all potential, but currently unused entry points into the structure are sealed. The active entry points are fitted with one-way exits, which are left in place 7-10 days to allow all bats to emerge normally during nightly feeding flights. The one-way exits are then removed and the remaining openings sealed until demolition if it will occur more than 30 days after demolition. If the interval between successful eviction and demolition will be short (less than 4 weeks), the one-way exits may often be left in place until demolition. This work must be conducted by, or under direct supervision or instruction by a bat biologist qualified in humane bat eviction methods and materials.

In some cases, the physical condition of the structure is so poor that humane eviction as described above is not possible. If that occurs, the building must be carefully, and selectively dismantled in such a way that the internal environment is altered to a degree sufficient to cause bats to abandon the roost and not return. This must occur under the guidance bat biologist qualified in partial dismantling of structures for bat eviction.

In general, humane eviction of bats must occur during seasonal periods of bat activity, ***between March 1, or when evening temperatures are above 45F and rainfall less than ½" in 24 hours occurs, and April 15, prior to parturition of pups. The next acceptable period for humane eviction with suitable roosting habitat is after pups become self-sufficiently volant – September 1 through about October 15, or prior to evening temperatures dropping below 45F and onset of rainfall fretter than ½" in 24 hours.***

Mitigation Measures: To prevent direct mortality of bats that may roost in the structures on site, the following measures are recommended:

Large Barn: Under direct supervision of a qualified bat biologist, and only during seasonal periods of bat activity (see below for dates), conduct partial dismantling of portions of exterior siding and roofing material to increase light and airflow into structure. This will cause bats to abandon the structure if the building is made effectively unsuitable for continued roosting activity. All walls will require some removal of siding material to accomplish this, but the upper loft will also require supplemental lights aimed up from the floor directly beneath the hop cars to cause bats to abandon the roost crevices.

We recommend the use of exterior, PAR-style LED lights in suitable fixtures; these will provide bright light without heat and be economical to operate. It may require 7-10 days of this treatment to cause all bats to abandon the structure prior to construction activities, which must either occur within 48 hours of these actions, or the building must be sealed using polyethylene sheeting, leaving no available gaps. All measures must be implemented only during seasonal periods of bat activity to prevent direct mortality of non-volant young or overwintering adults and juveniles.

South Hop Barn: Under direct supervision of a qualified bat biologist, and only during seasonal periods of bat activity (see below for dates), conduct partial dismantling of portions of exterior siding and roofing material to increase light and airflow into structure, causing bats to abandon the structure of their own volition. All walls will require some removal of siding material to accomplish this.

North Hop Barn: Under direct supervision of a qualified bat biologist, and only during seasonal periods of bat activity (see below for dates), conduct partial dismantling of portions of exterior siding and roofing material to increase light and airflow into structure, causing bats to abandon the structure of their own volition. All walls will require some removal of siding material to accomplish this.

Residence: Under direct supervision of a qualified bat biologist, and only during seasonal periods of bat activity (see below for dates), conduct partial dismantling of portions of exterior siding and roofing material to increase light and airflow into structure, causing bats to abandon the structure of their own volition. All walls and portions of the soffit boards will require some removal of material to accomplish this.

Chicken Shed: No further actions are required to prevent use by bats or take of roosting bats.

Pump/Storage Barn: To reduce the likelihood of this building being used by bats abandoning the larger structures, all doors should be left open during day and night hours. No further actions are required.

Acceptable periods for partial dismantling are:

1. ***Between approximately March 1 (or when heavy rains [greater than ½" in 24 hrs.] cease and/or evening temperatures remain above 45F) and April 15 (after which time females will begin to give birth to pups.***
2. ***Between September 1 (after all pups are self-sufficiently volant) and approximately October 15 (or before heavy rains [greater than ½" in 24 hrs.] begin and/or evening temperatures fall below 45F)***

Table 4: Recommended Mitigation Measures for Structures – 7097 Westside Road

Structure	Site Location	Occupied?	Mitigation
Large barn	East	Y	Conduct partial dismantling of structure to reduce habitat suitability (see text for full details); 1. Work must be conducted under direct supervision of a qualified bat biologist. 2. Partial dismantling must occur only between Mar. 1 – Apr. 15, or Sep. 1 – Oct. 15. 3. Supplemental illumination must be used in the loft to cause bats to abandon vertical gaps in bottoms of hop cars.
Hop Barn (southern)	East	Y	Conduct partial dismantling of structure to reduce habitat suitability (see text for full details); 1. Work must be conducted under direct supervision of a qualified bat biologist. 2. Partial dismantling must occur only between Mar. 1 – Apr. 15, or Sep. 1 – Oct. 15. 3. Supplemental illumination must be used in the loft to cause bats to abandon vertical gaps in bottoms of hop cars.
Hop Barn (northern)	East	Y	Conduct partial dismantling of structure to reduce habitat suitability (see text for full details); 1. Work must be conducted under direct supervision of a qualified bat biologist. 2. Partial dismantling must occur only between Mar. 1 – Apr. 15, or Sep. 1 – Oct. 15. 3. Supplemental illumination must be used in the loft to cause bats to abandon vertical gaps in bottoms of hop cars.
Small farm house	East	Y	Conduct partial dismantling of structure to reduce habitat suitability (see text for full details); 1. Work must be conducted under direct supervision of a qualified bat biologist. 2. Partial dismantling must occur only between Mar. 1 – Apr. 15, or Sep. 1 – Oct. 15. 3. Supplemental illumination must be used in the loft to cause bats to abandon vertical gaps in bottoms of hop cars.
Chicken coop	East	N	None
Pump storage barn	East	N	Leave barn doors open during daylight hours during partial dismantling of barns and farm house to prevent new occupation.

Impact: Removal of trees may cause direct mortality of roosting bats, if the trees the provide suitable roosting habitat are removed during seasonal periods of inactivity (maternity season or winter).

Mitigation Measure: To prevent direct mortality of bats that may roost in tree cavities, crevices, exfoliating bark, or foliage of the trees identified on the site, the following measures are recommended:

1) Potential habitat trees shall be removed only between approximately March 1, or when evening temperatures are above 45°F and rainfall less than ½" in 24 hours occurs, and April 15, prior to parturition of pups. The next acceptable period is after pups become self-sufficiently volant – September 1 through about October 15, or prior to evening temperatures dropping below 45°F and onset of rainfall greater than ½" in 24 hours.

2) Tree removal shall be conducted using a two-stage process over two consecutive days (e.g. Tuesday and Wednesday, or Thursday and Friday). With this method, small branches and small limbs containing ***no*** cavity, crevice or exfoliating bark habitat on habitat trees, as identified by a qualified bat biologist are removed first on Day 1, ***using chainsaws only*** (no dozers, backhoes, etc.). The following day (Day 2), the remainder of the tree is to be removed. The disturbance caused by chainsaw noise and vibration, coupled with the physical alteration, has the effect of causing colonial bat species to abandon the roost tree after nightly emergence for foraging. Removing the tree the next day prevents re-habituation and re-occupation of the altered tree.

3) Trees containing suitable potential habitat must be trimmed with chainsaws on Day 1 under initial field supervision by a qualified bat expert to ensure that the tree cutters fully understand the process, and avoid incorrectly cutting potential habitat features or trees. After tree cutters have received sufficient instruction, the qualified bat expert does not need to remain on the site.

4) All other vegetation other than trees within the Limit of Work should be removed prior to tree removal, according to the dates provided above. If vegetation must be removed outside those dates, a 50' buffer around each habitat tree should be observed to reduce likelihood of abandonment of the roost and young.

5) If non-habitat trees must be removed outside seasonal periods of bat activity as described above, a 50' buffer around each habitat tree should be observed to reduce likelihood of abandonment of the roost and young.

6) In order to minimize potential take of solitary bats such as *L. blossevillii* or *L. cinereus*, tree removal should begin with the smaller trees and vegetation on the site, followed by smaller trees in each location where trees are to be removed. Only chainsaws should be used, to create a noise disturbance that will be sufficient to cause roosting individual *L. blossevillii* or *L. cinereus* to abandon the site.

Movement Corridors

Although 3.47 acres are proposed for development no impacts to movement corridors for wildlife will occur. The drainages on the east side will not be developed, nor will the coast live oak woodland. Although the winery building on the west side of the proposed project area extends to the property line on both sides there is suitable undeveloped areas for wildlife to move around the building. The proposed winery would not be a barrier to movement, and animals can move around the structures at night. Thus, no impediment to movement corridors will occur from the proposed project. After the project is built, no peripheral barriers, such as fencing, will be installed.

APPENDIX A: FEDERAL, STATE AND LOCAL PLANS, POLICIES, REGULATIONS AND ORDINANCES

Federal Endangered Species Act - U.S. Fish and Wildlife Service
Pursuant to ESA, the U.S. Fish and Wildlife Service (USFWS) has regulatory authority over federally listed species. Under ESA, a permit to "take" a listed species is required for any federal action that may harm an individual of that species. Take is defined under Section 9 of ESA as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to engage in any such conduct." Under federal regulation, take is further defined to include habitat modification or degradation where it would be expected to result in death or injury to listed wildlife by significantly impairing essential behavioral patterns, including breeding, feeding, or sheltering. Section 7 of ESA requires all federal agencies to consult with USFWS to ensure that their actions are not likely to "jeopardize the continued existence" of any listed species or "result in the destruction or adverse modification" of designated critical habitat. No federal approvals or other actions are anticipated as being required to implement the project at this time. Therefore, consultation under Section 7 of ESA is not expected. However, if USACE determines that wetlands and/or other waters of the United States on the project site are subject to protection under Section 404 of the CWA, or any other federal action becomes necessary, consultation under Section 7 of ESA would be required.

For projects where federal action is not involved and take of a listed species may occur, the project proponent may seek to obtain a permit for incidental take under Section 10(a) of ESA. Section 10(a) of ESA allows USFWS to permit the incidental take of listed species if such take is accompanied by a habitat conservation plan (HCP) that includes components to minimize and mitigate impacts associated with the take. The permit is known as an incidental take permit. The project proponent must obtain a permit before conducting any otherwise-lawful activities that would result in the incidental take of a federally listed species.

Sections 404 and 401 of the Clean Water Act - U.S. Army Corps of Engineers
USACE regulates the discharge of dredged or fill material into waters of the United States under Section 404 of the CWA. Waters of the United States are defined as waters where use, degradation, or destruction could affect interstate or foreign commerce, tributaries to any of these waters, and wetlands that meet any of these criteria or that are somehow connected to any of these waters or their tributaries. Wetlands are defined as areas that are inundated or saturated by surface water or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted to life in saturated soil conditions. Wetlands falling under USACE jurisdiction must demonstrate the presence of three specific wetland parameters: hydric soils, hydrophytic vegetation, and sufficient wetland hydrology. Generally, wetlands include swamps, marshes, bogs, and similar areas. Lakes, rivers, and streams are defined as "other waters." Jurisdictional limits of these features are typically noted by the ordinary high-water mark (OHWM). The OHWM is the line on the shore or bank that is established by the fluctuations of water and indicated by physical characteristics, such as a clear, natural line impressed on the bank, shelving, changes in soils, lack of woody or terrestrial vegetation, the presence of litter or debris, or other characteristics of the surrounding areas.

Isolated ponds or seasonal depressions had been previously regulated as waters of the United States. However, in Solid Waste Agency of Northwestern Cook County (SWANCC) v. United States Army Corps of Engineers et al. (January 8, 2001), the U.S. Supreme Court ruled that certain "isolated" wetlands (e.g., nonnavigable, isolated, and intrastate) do not fall under the jurisdiction of the CWA and are no longer under USACE jurisdiction (although isolated wetlands are regulated by the State of California under the Porter-Cologne Water Quality Control Act—see discussion below). Some circuit courts (e.g., U.S. v. Deaton, 2003; U.S. v. Rapanos, 2003; Northern California River Watch v. City of Healdsburg, 2006), however, have ruled that the SWANCC opinion does not prevent CWA jurisdiction if a "significant nexus" such as a hydrologic connection exists, whether it be human-made (e.g., roadside ditch) or natural tributary to navigable waters, or direct seepage from the wetland to the navigable water, a surface or underground hydraulic connection, an ecological connection (e.g., the same bird, mammal, and fish populations are supported by both the wetland

and the navigable water), and changes to chemical concentrations in the navigable water due to water from the wetland.

Section 404 prohibits the discharge of dredged or fill material into waters of the United States (including wetlands) without a permit from USACE. With respect to the proposed project, the discharge of dredged or fill material includes the following activities:

- placement of fill that is necessary for the construction of any structure or infrastructure in a water of the United States;
- the building of any structure, infrastructure, or impoundment requiring rock, sand, dirt, or other material for its construction;
- site-development fills for recreational, industrial, commercial, residential, or other uses; and
- construction of causeways or road fills.

The regulations and policies of USACE, the U.S. Environmental Protection Agency (EPA), and USFWS mandate that the filling of wetlands be avoided unless it can be demonstrated that no practicable alternatives (to filling wetlands) exist. If the placement of fill into waters of the U.S., including wetlands, meets certain criteria the project be permitted under one of the Nation Wide Permits (NWP), which is an expedited permit process.

Section 401 of the CWA requires an applicant for any federal permit that may result in a discharge into waters of the United States to obtain a certification from the state that the discharge will comply with provisions of the CWA. The regional water quality control boards (RWQCBs) administer this program. Any condition of water quality certification would be incorporated into the USACE permit. The state has a policy of no net loss of wetlands and typically requires mitigation for impacts on wetlands before it will issue a water quality certification.

California Endangered Species Act (CESA)

The California Endangered Species Act (CESA) (FGC §§ 2050–2116) is administered by the California Department of Fish and Wildlife. The CESA prohibits the "taking" of listed species except as otherwise provided in state law. The CESA includes FGC Sections 2050–2116, and policy of the state to conserve, protect, restore, and enhance any endangered species or any threatened species and its habitat. The CESA requires mitigation measures or alternatives to a proposed project to address impacts to any State listed endangered, threatened or candidate species, or if a project would jeopardize the continued existence of any endangered or threatened species or result in the destruction or adverse modification of habitat essential to the continued existence of those species, if there are reasonable and prudent alternatives available consistent with conserving the species or its habitat which would prevent jeopardy. Section 86 of the FGC defines take as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill." Unlike the ESA, CESA applies the take prohibitions to species under petition for listing (state candidates) in addition to listed species. Section 2081 of the FGC expressly allows DFG to authorize the incidental take of endangered, threatened, and candidate species if all of the following conditions are met:

- The take is incidental to an otherwise lawful activity.
- The impacts of the authorized take are minimized and fully mitigated.
- Issuance of the permit will not jeopardize the continued existence of the species.
- The permit is consistent with any regulations adopted in accordance with §§ 2112 and 2114 (legislature-funded recovery strategy pilot programs in the affected area).
- The applicant ensures that adequate funding is provided for implementing mitigation measures and monitoring compliance with these measures and their effectiveness.

The CESA provides that if a person obtains an incidental take permit under specified provisions of the ESA for species also listed under the CESA, no further authorization is necessary under CESA if the federal permit satisfies all the requirements of CESA and the person follows specified steps (FGC § 2080.1).

California Environmental Quality Act (CEQA)

CEQA is a California statute passed in 1970, shortly after the United States federal government passed NEPA, to institute a statewide policy of environmental protection. CEQA does not directly regulate land uses, but instead requires state and local agencies within California to follow a protocol of analysis and public disclosure of environmental impacts of proposed projects and adopt all feasible measures to mitigate those impacts.

The CEQA statute, California Public Resources Code § 21000 et seq., codifies a statewide policy of environmental protection. According to CEQA, all state and local agencies must give major consideration to environmental protection in regulating public and private activities, and should not approve projects for which there exist feasible and environmentally superior mitigation measures or alternatives.

Species Protection under California Department of Fish and Wildlife
The CDFW is established under the Fish and Game Code (FGC) (FGC § 700) and states that the fish and wildlife resources of the state are held in trust for the people of the state by and through CDFW (FGC § 711.7(a)). All licenses, permits, tag reservations and other entitlements for the take of fish and game authorized by FGC are prepared and issued by CDFW (FGC § 1050 (a)).

Provisions of the FGC provide special protection to certain enumerated species such as:

§ 3503 protects eggs and nests of all birds.
§ 3503.5 protects birds of prey and their nests.
§ 3511 lists fully protected birds.
§ 3513 protects all birds covered under the federal Migratory Bird Treaty Act.
§ 3800 defines nongame birds.
§ 4150 defines nongame mammals.
§ 4700 lists fully protected mammals.
§ 5050 lists fully protected amphibians and reptiles.
§ 5515 lists fully protected fish species.

In addition, the Native Plant Protection Act (NPPA), directs the CDFW to carry out the Legislature's intent to "preserve, protect and enhance rare and endangered plants in this State." As a result, the NPPA allows the California Fish and Game Commission to designate native plants as endangered or rare, and to require permits for collecting, transporting, or selling such plants.

California Native Plant Society (CNPS)
The California Native Plant Society (CNPS) is a statewide non-profit organization dedicated to the monitoring and protection of sensitive species in California. The CNPS publishes and maintains an Inventory of Rare and Endangered Vascular Plants of California, focusing on geographic distribution and qualitative characterization of rare, threatened, or endangered vascular plant species of California. The list serves as the candidate list for listing as threatened and endangered by the CDFG. The Inventory assigns plants to the following categories:

A. Presumed Extinct in California
B. Rare or endangered in California and elsewhere
Rare or endangered in California, more common elsewhere
Plants for which more information is needed
Plants of limited distribution.

Additional rarity, endangerment, and distribution codes are assigned to each taxa.

Plants on Lists 1A, 1B, and 2 of the CNPS Inventory consist of plants that may qualify for listing, and the Department recommends they be addressed in CEQA projects (CEQA Guidelines Section 15380). However, a plant need not be in the Inventory to be considered a rare, threatened, or endangered species under CEQA. In addition, the DFG recommends, and local governments may require, protection of plants which are regionally significant, such as locally rare species, disjunct populations of more common plants, or plants on the CNPS Lists 3 and 4.

Waters of the State - California Regional Water Quality Control Board
The term "Waters of the State" is defined by the Porter-Cologne Act as "any surface water or groundwater, including saline waters, within the boundaries of the state." The Regional Water Quality Control Board (RWQCB) protects all waters in its regulatory scope, but has special responsibility for wetlands, riparian areas, and headwaters. These waterbodies have high resource value, are vulnerable to filling, and are not systematically protected by other programs. RWQCB jurisdiction includes "isolated" wetlands and waters that may not be regulated by the USACE under Section 404. "Waters of the State" are regulated by the RWQCB under the State Water Quality Certification Program which regulates discharges of fill and dredged material under Section 401 of the Clean Water Act and the Porter-Cologne Water Quality Control Act. Projects that require a USACE permit, or fall under other federal jurisdiction, and have the potential to impact "Waters of the State," are required to comply with the terms of the Water Quality Certification determination.

If a proposed project does not require a federal permit, but does involve dredge or fill activities that may result in a discharge to "Waters of the State," the RWQCB has the option to regulate the dredge and fill activities under its state authority in the form of Waste Discharge Requirements.

Streams, Lakes, and Riparian Habitat - California Department of Fish and Game
Streams and lakes, as habitat for fish and wildlife species, are subject to jurisdiction by CDFG under Sections 1600-1616 of the State Fish and Game Code. Alterations to or work within or adjacent to streambeds or lakes generally require a 1602 Lake and Streambed Alteration Agreement. The term stream, which includes creeks and rivers, is defined in the California Code of Regulations (CCR) as follows: "a body of water that flows at least periodically or intermittently through a bed or channel having banks and supports fish or other aquatic life. This includes watercourses having a surface or subsurface flow that supports or has supported riparian vegetation" (14 CCR 1.72). In addition, the term stream can include ephemeral streams, dry washes, watercourses with subsurface flows, canals, aqueducts, irrigation ditches, and other means of water conveyance if they support aquatic life, riparian vegetation, or stream-dependent terrestrial wildlife (CDFG ESD 1994). Riparian is defined as, "on, or pertaining to, the banks of a stream;" therefore, riparian vegetation is defined as, "vegetation which occurs in and/or adjacent to a stream and is dependent on, and occurs because of, the stream itself" (CDFG ESD 1994). Removal of riparian vegetation also requires a Section 1602 Lake and Streambed Alteration Agreement from CDFG.

Native Tree Protection and Preservation - Sonoma County
Pursuant to the Sonoma County Native Tree Protection and Preservation Ordinance, Chapters 25 and 26 of the Sonoma County Zoning Regulations, the County requires that projects shall be designed to minimize the destruction of protected trees.. Trees protected include the following: Big Leaf Maple (*Acer macrophyllum*), Black Oak (*Quercus kelloggii)*, Blue Oak (*Quercus douglasii*), Coast Live Oak (*Quercus agrifolia*), Interior Live Oak (*Quercus wislizenii*), Madrone (*Arbutus menziesii*), Oracle Oak (*Quercus morehus*), Oregon Oak (*Quercus garryana*), Redwood (*Sequoia sempervirens*), Valley Oak (*Quercus lobata*), California Bay (*Umbellularia californica*), and their hybrids.

With development permits a site plan shall be submitted that depicts the location of all protected trees greater than nine inches (9") and their protected perimeters in areas that will be impacted by the proposed development, such as the building envelopes, access roads, leachfields, etc. Lot line adjustments, zoning permits and agricultural uses are exempt from this requirement. The provisions of this section shall not apply to trees which are the subject of a valid timber harvesting permit approved by the state of California. This section shall not be applied in a manner that would reduce allowable density lower than that permitted as a result of CEQA or by other county ordinances or render a property undevelopable. To achieve this end, adjustments may be made.

Replacement trees may be located on residentially zoned parcels of at least one and one-half acres and on any commercial or industrial zoned parcel, regardless of size, where feasible. Where infeasible, they may be located on public lands or maintained private open space. In-lieu fees may be used to acquire and protect stands of native trees in preserves or place trees on public lands.

Permits to remove trees will take into account the environmental effects of removal, possible alternatives to removal, and whether preservation unreasonably interferes with development of the parcel. Required mitigation may include:

1. establishment and maintenance of replacement trees;
2. a detailed mitigation management plan;
3. removal of invasive exotics; and
4. posting of a bond to cover the cost of an inspection to ensure the success of measures
5. described above.

Appendix B: Potentially Occurring Special-Status Plant Species in the Study Area

Scientific Name Common Name	Status USFWS/ CDFW/ CNPS list	Habitat Affinities and Blooming Period/Life Form	Potential for Occurrence
Alopecurus aequalis var. *sonomensis* Sonoma alopecurus	FE/-/1B	Freshwater marshes and swamps, riparian scrub. May-July. Elevation: 5-365m.	None. No habitat present in study area.
Amorpha californica var. *napensis* Napa false indigo	-/-/1B	Broadleafed upland forest (openings), chaparral, cismontane woodland. Blooms April-July. Elevation: 120-2000m.	None. No habitat present in study area.
Arctostaphylos bakeri ssp. *bakeri* Baker's manzanita	-/CR/1B	Broadleafed upland forest, chaparral often on serpentinite. Blooms February to April. Elevation: 75-300m.	None. No habitat present in study area.
Arctostaphylos bakeri ssp. *sublevis* The Cedars manzanita	-/CR/1B	Closed-cone coniferous forest, chaparral, often on serpentine. Blooms February to April.	None. No habitat present in study area.
Arctostaphylos densiflora Vine Hill manzanita	-/CE/1B	Chaparral on acid marine sand. February-April. Elevation: 50-120m.	None. No habitat present in study area.
Arctostaphylos hispidula Howell's mananita	-/-/1B	Chaparral on serpentinite or sandstone. Blooms March to April. Elevation: 120-1250m.	None. No habitat present in study area.
Arctostaphylos stanfordiana ssp. *decumbens* Rincon Ridge manzanita	-/-/1B	Chaparral on rhyolitic soils and cismontane woodland. Blooms February to April (sometimes May). Elevation: 75-370m.	None. No habitat present in study area.
Blennosperma bakeri Sonoma sunshine	FE/CE/1B	Valley and foothill grassland (mesic), vernal pools. Blooms March to May. Elevation: 10-110m.	None. Not observed during surveys. Typical habitat not present in study area.
Brodiaea leptandra Narrow-anthered brodiaea	-/-/1B	Broadleafed upland forest, chaparral, cismontane woodland, lower montane coniferous forest, valley and foothill grassland on volcanic soils. Blooms May to July. Elevation: 110-915m.	None. Typical habitat present in study area. Not observed during surveys.
Calamagrostis bolanderi Bolander's reed grass	-/-/4	Bogs and fens, broadleafed upland forest, closed-cone coniferous forest, coastal scrub, meadows and seeps, freshwater marshes and swamps, North Coast coniferous forest on mesic sites. May-August. Elevation: 0-455m.	None. No habitat present in study area. Not observed during surveys.

Scientific Name Common Name	Status USFWS/ CDFW/ CNPS list	Habitat Affinities and Blooming Period/Life Form	Potential for Occurrence
Calamagrostis crassiglumis Thurber's reed grass	-/-/2B	Coastal scrub (mesic), freshwater marshes and swamps. Blooms April to July. Elevation: 90-1065m.	None. No habitat present in study area. Not observed during surveys.
Campanula californica Swamp harebell	-/-/1B	Bogs and fens, closed-cone coniferous forest, coastal prairie, meadows and seeps, freshwater marshes and swamps, North Coast coniferous forest. June-October. Elevation: 1-405m.	None. No habitat present in study area.
Carex comosa Bristly sedge	-/-/2B	Coastal prairie, marshes and swamps, lake margins, mesic sites in grasslands. Blooms May to Sept.	None. No habitat present in study area.
Castilleja ambigua var. *ambigua* Johnny-nip	-/-/4	Coastal bluff scrub, coastal prairie, coastal scrub, marshes and swamps, valley and foothill grassland, margins of vernal pools. Blooms March to August. Elevation 0-435m.	None. Typical habitat not present in study area. Not observed during surveys.
Castilleja uliginosa Pitkin Marsh paintbrush	-/CE/1A	Freshwater marshes and swamps. June-July. Elevation: 60m.	None. No habitat present in study area.
Ceanothus confusus Rincon Ridge ceanothus	-/-/1B	Closed-cone coniferous forest, chaparral, cismontane woodland on volcanic or serpentinite. Blooms February to June. Elevation: 75-1065m.	None. No habitat present in study area..
Ceanothus foliosus var. *vineatus* Vine Hill ceanothus	-/-/1B	Chaparral. March-May. Elevation: 45-305m.	None. No habitat present in study area.
Ceanothus gloriosus var. *exaltatus* Glory brush	-/-/4	Chaparral. Blooms March to August. Elevation: 30-610m.	None. No habitat present in study area.
Ceanothus purpureus Holly-leaved ceanothus	-/-/1B	Chaparral and cismontane woodland with rocky, volcanic substrate. Blooms February to June. Elevation: 120-640m.	None. No habitat present in study area.
Centromadia parryi ssp. *parry* Pappose tarplant	-/-/1B	Chaparral, coastal prairie, meadows and seeps, coastal marshes and swamps, valley and foothill grassland on vernally mesic, often alkaline sites. May-November. Elevation: 2-420m.	None. Typical habitat not present in study area. Not observed during surveys.
Chorizanthe valida Sonoma spineflower	FE/CE/1B	Coastal prairie on sandy soils. Blooms June to August. Elevation: 10-305m.	None. No habitat present in study area.

Scientific Name Common Name	Status USFWS/ CDFW/ CNPS list	Habitat Affinities and Blooming Period/Life Form	Potential for Occurrence
Clarkia imbricata Vine Hill clarkia	FE/CE/1B	Chaparral, valley and foothill grassland on acidic sandy loam soils. June-August. Elevation: 50-75m.	None. No habitat in study area.
Cordylanthus tenuis ssp. *brunneus* Serpentine bird's-beak	-/-/4	Closed-cone coniferous forest, chaparral, cismontane woodland on serpentinite. Blooms July to August. Elevation: 475-915m.	None. No habitat present in study area.
Cordylanthus tenuis ssp. *capillaris*	FE/CR/1B	Closed-cone coniferous forest, chaparral on serpentinite. June-September. Elevation: 45-305m.	None. No habitat in study area.
Cuscuta obtusiflora var. *glandulosa*	-/-/2B	Freshwater marshes and swamps. July-October. Elevation: 15-280m.	None. No habitat in study area.
Delphinium bakeri Baker's larkspur	FE/CE/1B	Broadleafed upland forest, coastal scrub, valley and foothill grassland, on decomposed shale, often mesic. Blooms March to May. Elevation: 80-305m.	None. Typical habitat not present in study area. Not observed during surveys.
Delphinium luteum Golden larkspur	FE/CR/1B	Chaparral, coastal prairie, coastal scrub on rocky soils. March-May. Elevation: 0-100m.	None. Not observed during surveys. Habitat not present on site.
Downingia pusilla Dwarf downingia	-/-/2B	Valley and foothill grassland (mesic), vernal pools. Blooms March to May. Elevation: 1-445m.	None. Not observed during surveys. Typical habitat not present in study area.
Erigeron biolettii Streamside daisy	-/-/3	Broadleafed upland forest, cismontane woodland, North Coast coniferous forest on rocky and mesic sites. Blooms June-October. Elevation 30-1100m.	None. No habitat present in study area.
Erigeron greenei Greene's narrow-leaved daisy	-/-/1B	Chaparral on serpentinite or volcanic soils. Blooms May to September. Elevation: 80-1005m.	None. No habitat present in study area.
Erigerion serpentinus Serpentine daisy	-/-/1B	Chaparral on serpentine and seeps. May-August. Elevation: 60-670m.	None. No habitat in study area.
Eriophorum gracile Slender cottongrass	-/-/4	Bogs and fens, meadows and seeps, upper montane coniferous forest on acidic soils. Blooms May to September. Elevation: 1280-2900m.	None. No habitat in study area.

Scientific Name Common Name	Status USFWS/ CDFW/ CNPS list	Habitat Affinities and Blooming Period/Life Form	Potential for Occurrence
Fritillaria liliacea Fragrant fritillary	-/-/1B	Cismontane woodland, coastal prairie, coastal scrub, valley and foothill grassland often on serpentinite. Blooms February to April. Elevation: 3-410m.	None. Not observed during surveys. Typical habitat not present in study area.
Gilia capitata ssp. *tomentosa* Woolly-headed gilia	-/-/1B	Coastal bluff scrub, valley and foothill grassland on serpentinite or rocky soils or outcrops. Blooms May to July. Elevation: 10-220m.	None. Not observed during surveys. Typical habitat not present in study area.
Hemizonia congesta ssp. *congesta* White seaside tarplant	-/-/1B	Valley and foothill grassland sometimes on roadsides. Blooms April to November. Elevation: 20-560m.	None. Not observed during surveys. No species of *Hemizonia* were observed in the study area.
Horkelia tenuiloba Thin-leaved horkelia	-/-/1B	Broadleafed upland forest, chaparral, valley and foothill grassland in mesic openings and on sandy soils. Blooms May to July. Elevation: 50-500m.	None. Not observed during surveys. No habitat present in study area.
Hosackia gracilis Harlequin lotus	-/-/4	Broadleafed upland forest, coastal bluff scrub, closed-cone coniferous forest, cismontane woodland, coastal prairie, coastal scrub, meadows and seeps, marshes and swamps, North Coast coniferous forest, valley and foothill grassland/wetlands, roadsides. Blooms March to July. Elevation: 0-700m.	None. Not observed during surveys. Typical habitat not present in study area.
Lasthenia burkei Burke's goldfields	FE/CE/1B	Meadows and seeps (mesic), vernal pools. April-June. Elevation: 15-600m.	None. Not observed during surveys. No habitat present in study area.
Lasthenia californica ssp. *bakeri* Baker's goldfields	-/-/1B	Closed-cone coniferous forest (openings), coastal scrub, meadows and seeps, marshes and swamps. April-October. Elevation: 60-520m.	None. Not observed during surveys. No habitat present in study area.
Legenere limosa Legenere	-/-/1B	Vernal pools. Blooms April-June. Elevation: 1-880m.	None. Not observed during surveys. No habitat present in study area.
Leptosiphon jepsonii Jepson's leptosiphon	-/-/1B	Chaparral, cismontane woodland, usually volcanic. Blooms March to May. Elevation: 100-500m.	None. Not observed during surveys. No habitat present in study area.

Scientific Name Common Name	Status USFWS/ CDFW/ CNPS list	Habitat Affinities and Blooming Period/Life Form	Potential for Occurrence
Lessingia arachnoidea Crystal Springs Lessingia	-/-/1B	Cismontane woodland, coastal scrub, valley and foothill grassland. Blooms July to October.	None. Not observed during surveys. Typical habitat not present in study area.
Lessingia hololeuca Woolly-headed Lessingia	-/-/3	Broadleafed upland forest, coastal scrub, lower montane coniferous forest, valley and foothill grassland. Blooms June to October. Elevation: 15-305m.	None. Not observed during surveys. Typical habitat not present in study area.
Lilium pardalinum ssp. *pitkinense* Pitkin Marsh lily	FE/CE/1B	Cismontane woodland, meadows and seeps, freshwater marshes and swamps, in mesic and sandy soils. June-July. Elevation: 35-65m.	None. No habitat present in study area.
Limnanthes vinculans Sebastopol meadowfoam	FE/CE/1B	Meadows and seeps, valley and foothill grassland, vernal pools/vernally mesic. April-May. Elevation: 15-305m.	None. Not observed during surveys. No habitat present in study area.
Microseris paludosa Marsh microseris	-/-/1B	Closed-cone coniferous forest, cismontane woodland, coastal scrub, valley and foothill grassland. April-June (sometimes July). Elevation: 5-300m.	None. Not observed during surveys. Typical habitat not present in study area.
Navarretia leucocephala ssp. *bakeri* Baker's navarretia	-/-/1B	Cismontane woodland, lower montane coniferous forest, meadows and seeps, valley and foothill grassland, vernal pools/mesic. Blooms April to July. Elevation: 5-1740m.	None. Not observed during surveys. Typical habitat not present in study area.
Navarretia leucocephala ssp. *plieantha* Many flowered navarretia	FE/-/1B	Volcanic ash flow vernal pools. Blooms May to June. Elevation: 30-950 m.	None. Not observed during surveys. No habitat present in study area.
Pleuropogon hooverianus North Coast semaphore grass	-/CT/1B	Broadleafed upland forest, meadows and seeps, North Coast coniferous forest. Blooms April to June. Elevation: 10-671m.	None. Not observed during surveys. No habitat present in study area.
Ranunculus lobbii Lobb's aquatic buttercup	-/-/4	Cismontane woodland, North Coast coniferous forest, valley and foothill grassland and vernal pools in mesic sites. Blooms February to May. Elevation: 15-470m.	None. Not observed during surveys. No habitat present in study area.
Rhynchospora alba White beaked-rush	-/-/2B	Bogs and fens, meadows and seeps, freshwater marshes and swamps. July-August. Elevation: 60-2040m.	None. Not observed during surveys. Typical habitat not present in study area.

Scientific Name Common Name	Status USFWS/ CDFW/ CNPS list	Habitat Affinities and Blooming Period/Life Form	Potential for Occurrence
Rhynchospora californica California beaked-rush	-/-/1B	Bogs and fens, lower montane coniferous forest, meadows and seeps, freshwater marshes and swamps. May-July. Elevation: 45-1010m.	None. Not observed during surveys. Habitat not present in study area.
Rhynchospora capitellata Brownish beaked-rush	-/-/2B	Lower montane coniferous forest, meadows and seps, marshes and swamps, upper montane coniferous forest/mesic. July-August. Elevation: 45-2000m.	None. Not observed during surveys. Habitat not present in study area.
Rhynchospora globularis Round-headed beaked-rush	-/-/2B	Freshwater marshes and swamps. Blooms July to August. Elevation: 45-60m.	None. No habitat present in study area.
Trifolium amoenum Showy Rancheria clover	FE/-/1B	Coastal bluff scrub, valley and foothill grassland, sometimes on serpentinite. Blooms April to June. Elevation: 5-415m.	None. No habitat present in study area.
Trifolium hydrophilum Saline clover	-/-/1B	Marshes and swamps, valley and foothill grassland (mesic, alkaline), vernal pools. April-June. Elevation: 0-300m.	None. Not observed during surveys. Typical habitat not present in study area.
Viburnum ellipticum Oval-leaved viburnum	-/-/2B	Chaparral, cismontane woodland, lower montane coniferous forest. Blooms May to June. Elevation: 215-1400m.	None. Not observed during surveys. No habitat present in study area.
Usnea longissima Long-beard lichen	-/-/4	Broadleafed upland forest, North Coast coniferous forest on tree branches; usually on old growth hardwoods and conifers. Elevation: 50-1460m.	None. Suitable habitat not present on site. Not observed during surveys.
Special Status Vegetation Communities			
SPECIAL NATURAL COMMUNITIES

List 3: Plants about which additional data are needed

Appendix C: Potentially Occurring Special-Status Animal Species in the Project Area

Common Name Scientific Name	Status USFWS/ CDFW	Habitat Affinities and Reported Localities in the Project Area	Occurrence for Potential
Invertebrates			
Giuliani's dubiraphian riffle beetle *Dubiraphia giulianii*	-/CSC	Inhabits exposed, wave-washed willow roots in the slow flows of the Russian River.	None: no suitable habitat.
California linderiella *Linderiella occidentalis*	-/CSC	Seasonal pools in unplowed grasslands with old alluvial soils underlain by hardpan or in sandstone depressions.	None: no suitable habitat.
Fish			
Russian River tule perch *Hysterocarpus traskii pomo*	-/SSC	Occurs in low elevation streams of the Russian River. Requires clear, flowing water with abundant cover and deep (>1M) pool habitat.	None: no suitable habitat.
Navarro roach *Lavinia symmetricus navarroensis*	-/SSC	Habitat generalists, found in warm intermittent streams as well as cold, well-aerated streams.	None: no suitable habitat.
Coho salmon - Central California Coast ESU *Onchorhynchus kisutch*	FE/SE	Occurs from Punta Gorda, in northern California, to the San Lorenzo River, in Santa Cruz County, and includes coho salmon populations from several tributaries of San Francisco Bay (e.g., Corte Madera and Mill Valley Creek).	None: no suitable habitat.
steelhead - Central California Coast DPS *Onchorhynchus mykiss*	FT/SSC	Requires beds of loose, silt-free, coarse gravel for spawning. Also needs cover, cool water and sufficient dissolved oxygen. Species reported in Sonoma Creek (CNDDB 2012).	None: no suitable habitat.
Amphibians			
foothill yellow-legged frog *Rana boylii*	-/ SSC	Inhabits permanent, flowing stream courses with a cobble substrate and a mixture of open canopy riparian vegetation. Species reported more than 3 miles in distance from project site (CNDDB 2012).	None: no suitable habitat.
California red-legged frog *Rana draytonii*	FT/ SSC	Prefers semi-permanent and permanent stream pools, ponds and creeks with emergent and/or riparian vegetation. Occupies upland habitat especially during the wet winter months. Species reported more than 3 miles in distance from project site (CNDDB 2014).	**Low**: provides suitable habitat outside project area, but high predator load.
Reptiles			
western pond turtle *Emys marmorata marmorata*	-/ SSC	Prefers permanent, slow-moving creeks, streams, ponds, rivers, marshes and irrigation ditches with basking sites and a vegetated shoreline. Requires upland sites for egg-laying. Species reported more than 3 miles in distance from project site (CNDDB 2014).	**High**: pond on site provides suitable habitat.

Common Name Scientific Name	Status USFWS/ CDFW	Habitat Affinities and Reported Localities in the Project Area	Occurrence for Potential
		Birds	
Cooper's hawk *Accipiter cooperi*	MB/ SSC	Nests primarily in deciduous riparian forests. May also occupy dense canopied forests from gray pine-oak woodland to ponderosa pine. Forages in open woodlands.	None: no suitable habitat.
sharp-shined hawk *Accipiter striatus*	MB/ SSC	Dense canopy pine or mixed conifer forest and riparian habitats. Water within one mile required.	None: no suitable habitat.
Great blue heron *Ardea herodius*	MB/ SSC	Nests colonially in large trees near water	None: no suitable habitat.
white-tailed kite *Elanus leucurus*	MB/CFP	Inhabits low rolling foothills and valley margins with scattered oaks and river bottom- lands or marshes adjacent to deciduous woodlands. Prefers open grasslands, meadows and marshes for foraging close to isolated, dense-topped trees for nesting and perching.	None: would have been detected during field surveys.
Osprey *Pandion haliaetus*	-/SSC	Nests in large trees within 15 miles of good fish-producing water body.	None: no suitable habitat.
black phoebe *Sayornis nigricans*	MB/-	Nests in anthropogenic structures on ledges. Nest made of mud pellets, dry grasses, weed stems, plant fibers and hair.	**Observed on-site.**
		Mammals*	
Pallid bat *Antrozous pallidus*	-/SSC, WBWG:H	Day roosts in crevices and cavities in rock outcrops, mines, caves, buildings, bridges, properly-designed bat houses, as well as hollows and cavities in a wide variety of tree species. May roost alone, in small groups (2 to 20 bats), or in 100s in maternity roosts, with males and non-reproductive subadults in other, smaller roosts. High reliance on oak woodland habitat in many portions of its range in California, but uses a wide variety of vegetative habitat for foraging. Forages on larger prey taken on the ground or in the air, usually within 6-km of the day roost.	**High:** Suitable potential building habitat occurs on site.

Common Name Scientific Name	Status USFWS/ CDFW	Habitat Affinities and Reported Localities in the Project Area	Occurrence for Potential
Townsend's big-eared bat *Corynorhinus townsendii townsendii*	-/CPE, WBWG:H	Day roosts in cave analogs; mines, buildings, bridges, sometimes large tree hollows. Particularly sensitive to roost disturbance, this species has declined throughout its range in California; very few maternity roosts are known in California. Switches roosts seasonally, sometimes within each season. Females form maternity colonies, males roost singly, and all disperse widely after maternity season. During winter, roosts in cold, but non-freezing roosts, which may include man-made structures. Forages in a variety of habitats, consistently in riparian and stream corridors, avoiding open habitat. May commute relatively long distances to forage.	**Medium:** Suitable potential building habitat occurs on site, but currently less suitable due to disturbance levels.
Western red bat *Lasiurus blossevillii*	-/SSC, WBWG:H	Solitary roosting, except when females are with young (from 2 to 6 are born). Roosts almost exclusively in foliage, under overhanging leaves, in woodland borders, rivers, agricultural areas including orchards, and urban areas with mature trees. Typically found in large cottonwoods, sycamores, walnuts and willows associated with riparian habitats. Forages over mature orchards, oak woodland, low elevation conifer forests, riparian corridors, non-native trees in urban and rural residential areas, and around strong lighting.	**Medium:** Suitable potential tree foliage occurs on site.
Hoary bat *Lasiurus cinereus*	-/-, WBWG:M	Roosts singly except when females are with young (from 2 to 4 are born) in dense foliage of medium to large coniferous and deciduous trees. Highly migratory, occurs from sea level to tree line in Sierra Nevada. Summer records predominantly male. Forages along stream and river corridors, open water bodies, meadows, and open forest above canopy.	**Medium:** Suitable potential tree foliage occurs on site.
California myotis *Myotis californicus*	-/-	Females give birth to one young. Typically roosts alone or in small groups in almost every habitat from desert to mountains, but most abundant at lower to mid-elevations. Roosts in crevices in rocks, slabs, hollow trees, exfoliating bark, buildings, mines. In trees may exhibit low roost fidelity, switching frequently. Emerges early in evening, forages along tree margins, canopy edge, over water, along trails and higher above ground in open habitat. Typically hibernates.	Medium: Potential to occur in trees and buildings.

Common Name Scientific Name	Status USFWS/ CDFW	Habitat Affinities and Reported Localities in the Project Area	Occurrence for Potential
Western small-footed myotis *Myotis ciliolabrum*	-/-, WBWG:M	Females give birth to one young, roosts singly or in small maternity groups in cliff and rock crevices, tree snags, buildings, concrete bridges and viaducts, caves and mines, occasionally under tree bark, swallow nests – males roost singly. Forages in early evening near rocks, bluffs, cliffs and tree margins, as well as water courses, and man-made water impoundments. Hibernates in small numbers.	Low: Potential to occur in buildings.
Long-eared myotis *Myotis evotis*	-/-, WBWG:M	Reproductive females form small maternity colonies between 2-30 individuals; males and non-reproductive females roost singly or in small groups nearby. Found from coastal forests to high elevation, is absent from Central Valley and Sonoran and Colorado desert regions. May switch roosts frequently. Day roosts in hollow trees, under exfoliating bark, caves, mines, bridges, buildings and crevices in rock outcrops, under bark of small black oaks in northern California, also use mixed conifer forests throughout California. Nights roosts include bridges, caves. May hibernate.	Medium: Potential to occur in trees and buildings.
Fringed myotis *Myotis thysanodes*	-/-, WBWG:H	Roosts colonially, up to 2,000 individuals. Females form maternity roosts, give birth to one young. Found from coast to ca. 1,800 m in Sierra Nevadas, though most are known to the west of that range. Rare in all localities, data suggests serious population declines. Roosts in rock crevices, caves, mines, buildings and bridges, as well as tree hollows, particularly large conifer snags. Occurs in xeric woodland, hot desert-scrub, grassland, sage-grassland steppe, spruce-fir, mesic old growth forest, coniferous and deciduous/coniferous forests. Forages over secondary streams in fairly cluttered habitat, over meadows. May hibernate or use intermittent torpor.	Low: Potential to occur in buildings.

Common Name Scientific Name	Status USFWS/ CDFW	Habitat Affinities and Reported Localities in the Project Area	Occurrence for Potential
Long-legged Myotis *Myotis volans*	-/-, WBWG:H	Roosts colonially, females forming maternity colonies, giving birth to single young. Found throughout most of California from the coast to high elevation in Sierra Nevada and White Mountains, as well as mountains of Mojave Desert, central San Diego County, Coast Range, transverse ranges between Los Angeles basin and Central Valley. Roosts from sea level to ca. 3,000 m, in coniferous montaine forests, occasionally riparian and desert habitats. Primarily uses trees, particularly large diameter conifers, under bark and in cavities, sometimes in abandoned buildings, mines, caves, cracks in the ground, and cliff/rock faces. Aerially forages in and around forest canopy. Hibernates in caves and mines.	Low: Potential to occur in buildings.
Yuma myotis *Myotis yumanensis*	-/-, WBWG:M	Forms often large maternity colonies, females giving birth to one young. Generally confined to lower elevations from sea level to up to 1,300 m in central Sierra Nevada and 2,000 m in southern Sierra Nevada. Males roost singly. Primarily a crevice roosting species in natural habitat, forms large maternity colonies in large spaces in man-made roosts, e.g. buildings. Also uses bridges, caves, mines, tree cavities, bat houses, abandoned swallow nests, exfoliating bark. Emerges early and forages almost exclusively over quiet water – ponds, pools, reservoirs, swimming pools. Appears to migrate, may hibernate in colder portions of their range.	**Observed on site: occupying barn and hop kiln.**
Brazilian free-tailed bat *Tadarida brasiliensis*	-/-	Found in large to very large colonies (several hundred to millions), females giving birth to single young in maternity roosts. Found almost everywhere throughout California, from sea level up to about 3,700 m in some western mountain ranges, but mostly below about 2,000 m. Crevice and cavity dwellers, uses rock crevices, caves, mines, buildings, bridges, tunnels, bat houses, culverts, abandoned swallow nests. Forages from 6 m to thousands of meters above ground, often very large distances (<50 km) from day roost. Migrates in colder portions of range, or makes winter movements to Coast Range where it remains active or semi-active throughout winter, using torpor. Can remain active throughout winter in southern portion of state.	**Observed on site: occupying barn and hop kiln.**

* Includes bat species expected to occur in the project region and vicinity based on known roosting ecology and habitat relationships, but not reported in the CNDDB.

WESTERN BAT WORKING GROUP

WBWG:H – High Priority, species are imperiled or are at high risk of imperilment based on available information on distribution, status, ecology and known threats.

WBWG:M – Medium Priority, species are at medium risk of imperilment based on available information on distribution, status, ecology and known threats.

Appendix D: Plant species observed April 28 and May 12, 2014

Scientific Name	**Common Name**
Aesculus californica	California buckeye
Aira caryophyllea	European hair grass*
Alisma trivale	Water plantain
Alnus cordata	Italian alder*
Anagallis arvensis	Scarlet pimpernel*
Anthemis cotula	Mayweed*
Avena barbata	Slender wild oats*
Bellis perennis	English daisy*
Brassica nigra	Black mustard*
Brassica rapa	Field mustard*
Briza minor	Small quaking grass*
Bromus alopecuros	Poverty brome*
Bromus diandrus	Ripgut brome*
Bromus hordaeceus	Soft chess*
Capsella bursa-pastoris	Shepherd's purse*
Carduus pycnocephalus	Italian thistle*
Cerastium glomeratum	Mouse-ear chickweed*
Claytonia perfoliata	Miner's lettuce
Convolvulus arvensis	Bindweed*
Cynodon dactylon	Bermuda grass*
Cyperus eragrostis	Umbrella sedge
Elymus triticoides	Creeping wildrye
Erodium botrys	Broad leaved filaree*
Erodium cicutarium	Red stemmed filaree*
Eschscholzia californica	California poppy
Festuca bromoides	Six weeks fescue*
Festuca myuros	Rattail fescue*
Festuca perennis	Ryegrass*
Ficus sp.	Fig trees*
Gleditsia triacanthos	Honey locust*
Helminthotheca echioides	Bristly ox-tongue*
Hordeum brachyantherum	Meadow barley
Hordeum marinum ssp. *gussoneanum*	Mediterranean barley*
Hordeum murinum ssp. *leporinum*	Hare barley*
Hypochaeris radicata	Rough cat's-ear*
Iris sp.	Garden iris*
Juglans hindsii	Northern California black walnut
Juncus tenuis	Povery runs
Lactuca saligna	Willow-leaf lettuce*
Lactuca serriola	Prickly lettuce*
Lamium amplexicaule	Dead nettle*
Lepidium nitidum	Pepperweed
Lobularia maritima	Sweet allysum*
Malus sp.	Apple trees*
Malva sp.	Mallow*
Medicago polymorpha	Bur clover*
Melilotus officinalis	Yellow sweet clover*
Mentha pulegium	Pennyroyal*

Scientific Name	Common Name
Phalaris aquatica	Harding grass*
Plantago lanceolata	English plantain*
Poa annua	Annual bluegrass*
Populus fremontii	Fremont cottonwood
Prunus sp.	Fruit trees*
Quercus agrifolia	Coast live oak
Quercus kelloggi	Black oak
Quercus lobata	Valley oak
Quercus rubra	Red oak*
Ranunculus muricatus	Spiny fruited buttercup*
Raphanus sativus	Wild radish*
Rosa sp.	Garden rose*
Rubus armeniacus	Himalayan blackberry*
Rumex crispus	Curly dock*
Rumex pulcher	Fiddle dock*
Senecio vulgaris	Common groundsel*
Sequoia sempervirens	Coast redwood
Sonchus asper	Prickly sow thistle*
Spergularia rubra	Red sandspurrey*
Stellaria media	Common chickweed*
Trifolium hirtum	Rose clover*
Umbellularia californica	California bay laurel
Veronica peregrina ssp. *halapensis*	Hairy purslane speedwell
Vicia sativa	Spring vetch*

* = Non-native species

Appendix E: Wildlife species observed during April 28, 2014

Scientific Name	Common Name
Lithobates catesbeianus	Eastern bullfrog
Pseudacris sierrae	Sierran treefrog
Sceloporus occidentalis	Western fence lizard
Calypte anna	Anna's hummingbird
Picoides pubescens	Downy woodpecker
Sayornis saya	Say's phoebe
Tachycineta bicolor	Tree Swallow
Aphelocoma californica	Western scrub jay
Corvus brachyrhynchos	American crow
Junco hyemalis	Dark-eyed junco
Melozone crissalis	California towhee
Pipilo maculatus	Spotted towhee
Odoicoileus hemionius californicus	Black-tailed deer (sign)
Mephitis mephitis	Skunk (sign)
Procyon lotor	Raccoon (sign)

David Ramey
Ramey Wine Cellars
202 Haydon Street | PO Box 788
Healdsburg, CA 95448
Ph: 707-433-0870 x1101

RE: Additional Information– Ramey Wine Cellars

Dear David:

This letter provides additional information on the following two items:

The Western pond turtle is identified as having a high probability of occurring on the site in the irrigation pond and has been reported less than a mile from the project site. The chart shows a high occurrence. However, there is no mitigation measure or any discussion of why a mitigation is not needed. Please ask the Biologist to provide a mitigation or explain why it is not needed.

Please include the following:

Western Pond Turtle: Although no western pond turtle was observed in the reservoir at the time of the 2014 survey, or subsequent surveys in 2015 and 2016, there is suitable aquatic habitat present that may be occupied in the future. The surrounding unplanted areas near the reservoir may be suitable habitat for upland nesting habitat in the future.

To protect the potential habitat for the western pond turtle, the following terms are recommended:

a. Establish and maintain a minimum 50-foot wide setback around the reservoir. Except for the exclusions stated herein, no activities shall occur within the setback area. Excluded from the setback area required by this term are any features, and access to such features, that are currently in existence and are delineated on the proposed development map. Features are defined as including but not limited to: cropland and planted landscape areas, roads and roadways, bridges, equipment and material storage areas, buildings, structures, fences, wells, pipes, drainage facilities, utility lines and poles, pumps, sumps, and water diversion and storage facilities. Planting and irrigation of riparian vegetation within the setback area is allowed;

b. In those areas not already paved or graveled, a qualified biologist shall conduct a pre-construction survey for western pond turtle. If pond turtle is observed in the proposed construction area, the biologist shall notify CDFW and provide a relocation plan for the individual.

c. In the future, prior to dredging the reservoir, a plan should be created to avoid disturbing the emergent (wetland) vegetation around the reservoir during dredging operations. Approval of any dredging operations should be obtained from the California Department of Fish and Wildlife;

The Biologist provides a mitigation for bats and supervision during "*seasonal periods*". Seasonal periods needs to be defined (for example March 1 to June 30th) ???.

Page 24 identifies the seasonal periods of bat activity ***between March 1, or when evening temperatures are above 45F and rainfall less than ½" in 24 hours occurs, and April 15, prior to parturition of pups. The next acceptable period for humane eviction with suitable roosting habitat is after pups become self-sufficiently volant – September 1 through about October 15, or prior to evening temperatures dropping below 45F and onset of rainfall fretter than ½" in 24 hours.***

The document then identifies how the specific work is to be conducted per building, under the direct supervision of a qualified bat biologist, with the following identified on page 25:
Acceptable periods for partial dismantling are:

1. ***Bio***

Further on page 25, in Table 4, Recommended Mitigation Measures for Structures – 7097 Westside Road, are the structures and the mitigation measures per structure identified with the seasons identified for dismantling.
Page 26, also identifies when tree removal of suitable roosting habitat should occur and reads as follows:

1) Potential habitat trees shall be removed only between approximately March 1, or when evening temperatures are above 45°F and rainfall less than ½" in 24 hours occurs, and April 15, prior to parturition of pups. The next acceptable period is after pups become self-sufficiently volant – September 1 through about October 15, or prior to evening temperatures dropping below 45°F and onset of rainfall greater than ½" in 24 hours

We believe that this addresses the counsel's concerns. Please let us know if you have any questions.

Regards,

Trish Tatarian

SUBJECT: **Ramey Winery at 7097 Westside Road near Healdsburg, CA – Greenhouse Gas Emissions Analysis**

Dear David:

This letter presents the evaluation of greenhouse gas (GHG) emissions associated with a proposed new winemaking facility near Healdsburg, CA at 7097 Westside Road in unincorporated Sonoma County. The proposed project includes production of 60,000 cases of wine in an approximate 35,000 square foot 2-story facility.[1] The project would also include a tasting room, retail sales, and an area designated for trade-related special events. The Project application includes provisions for 24 special events per year. These include 10 events with 30 people in attendance, five 60-person catered events, participation in five 120-person industry-wide events, and four 250-person outdoor events.

The primary source of GHG emissions associated with the project would be from traffic generated by the proposed project. Other sources would include direct emissions from natural gas usage and indirect emissions from electricity usage. Winemaking, occurring onsite, generates emissions of CO_2 through the fermentation process that are considered biogenic emissions.

Traffic information is based on the Traffic Study prepared by W-Trans for the project, dated August 16, 2013. This analysis evaluates the greenhouse gas emissions of the proposed project, resulting primarily from vehicle traffic. We are not aware of any stationary sources associated with the project that would generate substantial GHG emissions.

The proposed project is located in northern Sonoma County, which is in the North Coast Air Basin. The Northern Sonoma County Air Pollution Control District has jurisdiction over air quality in this area but uses the Bay Area Air Quality Management District (BAAQMD) CEQA Guidelines to evaluate GHG emissions. There are no Northern Sonoma Coast Air Pollution Control District-specific criteria with respect to GHGs. Accordingly, our analysis was conducted following guidance provided by BAAQMD.[2]

---

Per Appendix G of the CEQA Guidelines and BAAQMD recommendations, greenhouse gas emissions are considered significant if implementation of the proposed projects would:

1. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.
2. Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

The BAAQMD provides guidance in assessing impacts to lead agencies in the Bay Area, which are used throughout Sonoma County. In June 2010, BAAQMD adopted thresholds of significance to assist in the review of projects under CEQA. These thresholds were designed to establish the level at which BAAQMD believed air pollution emissions would cause significant environmental impacts under CEQA and were posted on BAAQMD's website and included in the Air District's updated CEQA Guidelines. The BAAQMD thresholds were developed specifically for the Bay Area after considering the latest Bay Area GHG inventory and the effects of AB 32 scoping plan measures that would reduce regional emissions. BAAQMD intends to achieve GHG reductions from new land use developments to close the gap between projected regional emissions with AB 32 scoping plan measures and the AB 32 targets. The BAAQMD GHG recommendations include a bright-line emissions threshold of 1,100 metric tons (MT) of CO_2e or an emission efficiency metric of 4.6 MT of CO_2e per year per capita (future residences and full-time workers) if the bright-line threshold is exceeded. Projects that have emissions below 1,100 MT of CO_2e per year, or 4.6 MT of CO_2e per year per capita are considered to have less than significant GHG emissions.

Project Emissions

The California Emissions Estimator Model, Version 2013.2.2 (CalEEMod) was used to predict operational period emissions. Unless otherwise noted below, the model defaults for the Sonoma County were used. The Year 2015 was used for modeling, as this assumed to be the first full year after construction that the project could be operational. Annual emissions occurring after 2015 would be lower as vehicle and electricity production emission rates are anticipated to continually decrease. CalEEMod predicts emissions for mobile, areas sources, electricity consumption, natural gas combustion, electricity usage associated with water usage and wastewater discharge, and solid waste land filling and transport. Table 1 summarizes annual operational GHG emissions due to implementation of the project. Inputs to the GHG modeling are described below.

Traffic

The CalEEMod model uses mobile emission factors from the California Air Resources Board's EMFAC2011 model. Forecasted project trip generation estimates provided by W-Trans were applied. The default trip lengths and traffic mix for Sonoma County in CalEEMod were also used. Mobile emissions from planned county-wide industry events were calculated in a separate model run and were based on a reasonable worst-case scenario involving twenty-four 250-person events annually. Each event was calculated to generate 1,769 pounds of CO_2e per day, or 42,456 pounds (19 metric tons) annually.

Electricity, Natural Gas, Water Usage and Solid Waste Production

Default rates for energy consumption were assumed in the model. Emissions rates associated with electricity consumption were adjusted to account for Pacific Gas & Electric utility's (PG&E) projected 2015 CO_2 intensity rate. This 2015 rate is based, in part, on the requirement of a renewable energy portfolio standard of 33 percent by the year 2020. CalEEMod uses a default rate of 641.35 pounds of

CO_2 per megawatt of electricity produced. The derived 2015 rate for PG&E was estimated at 391.16 pounds of CO_2 per megawatt of electricity delivered and is based on the California Public Utilities Commission (CPUC) GHG Calculator.[3] Note that solid waste emissions do not include any factors for waste diversion, which would reduce emissions further.

Wine Fermentation

The CalEEMod model, described above, does not account for the CO_2 emissions from wine fermentation. CO_2 is released during this process. Although this is considered a biogenic emission, they were included in this analysis. The amount of CO_2 emitted is dependent on many variables including the type of wine produced and the winemaking process. The International Wine Carbon Calculator (IWCC version 1.3) is an Excel spreadsheet that provides GHG emission estimates from various winery operations. This program was utilized to generally estimate CO_2 emissions from fermentation, since specific details of the wine making were not known. Assuming about 1,110 tons of grapes would be used to produce 60,000 cases of wine, CO_2 emissions would be about 125 metric tons per year. These emissions are offset by the carbon sequestration resulting from the growing of the grapes; however, the offset was not computed for this evaluation.

Table 1
Annual Operational GHG Emissions in Metric Tons of CO_2e

Source	Methodology	Emissions
Mobile	Includes daily traffic generation including truck traffic	181
Mobile	24 Annual Events	19
Area	Includes landscaping from CalEEMod default	<1
Electricity	Based on CalEEmod default adjusted to PG&E emission rates published by CPUC.	56
Natural Gas	Based on CalEEMod default	52
Water	Based on CalEEMod default	18
Solid Waste	Based on CalEEMod default	20
Wine Fermentation	Based on IWCC v1.3 estimate for 60,000 cases	125
Total		**472**

---

[3] California Public Utilities Commission's GHG Calculator version 3c, October 7, 2010. Available on-line at: http://ethree.com/public_projects/cpuc2.php. Accessed: October 27, 2013.

As shown in Table 1, the proposed project would have total direct and indirect emissions that are below the GHG operational threshold (1,100 metric tons of CO_2e per year) recommended by BAAQMD for new projects. Therefore, the project's GHG emissions would *not significantly* contribute to a cumulative impact on global climate change.

* * *

This concludes our assessment of the GHG impacts from this project. If you have any questions or comments, please feel free to contact me at (707) 794-0400 x35. We appreciate the opportunity to assist you.

Sincerely,

Joshua D. Carman
Project Scientist

Illingworth & Rodkin

SUBJECT: **Ramey Winery at 7097 Westside Road near Healdsburg, CA – Greenhouse Gas Emissions Analysis**

Dear David:

This letter presents the evaluation of greenhouse gas (GHG) emissions associated with a proposed new winemaking facility near Healdsburg, CA at 7097 Westside Road in unincorporated Sonoma County. The proposed project includes production of 60,000 cases of wine in an approximate 35,000 square foot 2-story facility.[1] The project would also include a tasting room, retail sales, and an area designated for trade-related special events. The Project application includes provisions for 24 special events per year. These include 10 events with 30 people in attendance, five 60-person catered events, participation in five 120-person industry-wide events, and four 300-person outdoor events.

The primary source of GHG emissions associated with the project would be from traffic generated by the proposed project. Other sources would include direct emissions from natural gas usage and indirect emissions from electricity usage. Winemaking, occurring onsite, generates emissions of CO_2 through the fermentation process that are considered biogenic emissions.

Traffic information is based on the Traffic Study prepared by W-Trans for the project, dated August 16, 2013. This analysis evaluates the greenhouse gas emissions of the proposed project, resulting primarily from vehicle traffic. We are not aware of any stationary sources associated with the project that would generate substantial GHG emissions.

The proposed project is located in northern Sonoma County, which is in the North Coast Air Basin. The Northern Sonoma County Air Pollution Control District has jurisdiction over air quality in this area but uses the Bay Area Air Quality Management District (BAAQMD) CEQA Guidelines to evaluate GHG

---

[1] Project square footage estimated from plan drawings.

emissions. There are no Northern Sonoma Coast Air Pollution Control District-specific criteria with respect to GHGs. Accordingly, our analysis was conducted following guidance provided by BAAQMD.[2]

Setting and Regulatory Background

Global temperatures are affected by naturally occurring and anthropogenic-generated (generated by humankind) atmospheric gases, such as water vapor, carbon dioxide, methane, and nitrous oxide. Gases that trap heat in the atmosphere are called greenhouse gases (GHG). Solar radiation enters the earth's atmosphere from space, and a portion of the radiation is absorbed at the surface. The earth emits this radiation back toward space as infrared radiation. Greenhouse gases, which are mostly transparent to incoming solar radiation, are effective in absorbing infrared radiation and redirecting some of this back to the earth's surface. As a result, this radiation that otherwise would have escaped back into space is now retained, resulting in a warming of the atmosphere. This is known as the greenhouse effect. The greenhouse effect helps maintain a habitable climate. Emissions of GHGs from human activities, such as electricity production, motor vehicle use and agriculture, are elevating the concentration of GHGs in the atmosphere, and are reported to have led to a trend of unnatural warming of the earth's natural climate, known as global warming or global climate change. The term "global climate change" is often used interchangeably with the term "global warming," but "global climate change" is preferred because it implies that there are other consequences to the global climate in addition to rising temperatures. Other than water vapor, the primary GHGs contributing to global climate change include the following gases:

- Carbon dioxide (CO2), primarily a byproduct of fuel combustion;
- Nitrous oxide (N2O), a byproduct of fuel combustion; also associated with agricultural operations such as the fertilization of crops;
- Methane (CH4), commonly created by off-gassing from agricultural practices (e.g. livestock), wastewater treatment and landfill operations;
- Chlorofluorocarbons (CFCs) were used as refrigerants, propellants and cleaning solvents, but their production has been mostly prohibited by international treaty;
- Hydrofluorocarbons (HFCs) are now widely used as a substitute for chlorofluorocarbons in refrigeration and cooling; and
- Perfluorocarbons (PFCs) and sulfur hexafluoride (SF6) emissions are commonly created by industries such as aluminum production and semiconductor manufacturing.

These gases vary considerably in terms of Global Warming Potential (GWP), a term developed to compare the propensity of each GHG to trap heat in the atmosphere relative to another GHG. GWP is based on several factors, including the relative effectiveness of a gas to absorb infrared radiation and the length of time of gas remains in the atmosphere. The GWP of each GHG is measured relative to CO_2. Accordingly, GHG emissions are typically measured and reported in terms of CO_2 equivalent (CO_2e). For instance, SF_6 is 22,800 times more intense in terms of global climate change contribution than CO_2.

The State of California is addressing the issue of GHG through legislation, policy guidance, and outreach programs. CO_2 is the primary GHG emitted from land use and industrial projects. In 2006 California enacted AB 32 – the Global Warming Solutions Act, which requires that statewide GHG emissions be reduced to 1990 levels by 2020. In 2008, the California Air Resources Board (CARB) adopted the Climate Change Scoping Plan in response to AB 32. This plan describes the strategies that the State will

---

[2] BAAQMD, 2011. *BAAQMD CEQA Air Quality Guidelines*. May.

implement to reduce future emissions by 28% to meet the 1990 target goal in 2020. BAAQMD's analysis of future land use development in the Bay Area and applicable AB 32 GHG reduction strategies lead to the development of emission-based significance thresholds for the projects in the Bay Area, which are also used in northern Sonoma County.

Per Appendix G of the CEQA Guidelines and BAAQMD recommendations, greenhouse gas emissions are considered significant if implementation of the proposed projects would:

1. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.
2. Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

The BAAQMD provides guidance in assessing impacts to lead agencies in the Bay Area, which are used throughout Sonoma County. In June 2010, BAAQMD adopted thresholds of significance to assist in the review of projects under CEQA. These thresholds were designed to establish the level at which BAAQMD believed air pollution emissions would cause significant environmental impacts under CEQA and were posted on BAAQMD's website and included in the Air District's updated CEQA Guidelines. The BAAQMD thresholds were developed specifically for the Bay Area after considering the latest Bay Area GHG inventory and the effects of AB 32 scoping plan measures that would reduce regional emissions. BAAQMD intends to achieve GHG reductions from new land use developments to close the gap between projected regional emissions with AB 32 scoping plan measures and the AB 32 targets. The BAAQMD GHG recommendations include a bright-line emissions threshold of 1,100 metric tons (MT) of CO_2e or an emission efficiency metric of 4.6 MT of CO_2e per year per capita (future residences and full-time workers) if the bright-line threshold is exceeded. Projects that have emissions below 1,100 MT of CO_2e per year, or 4.6 MT of CO_2e per year per capita are considered to have less than significant GHG emissions.

Project Emissions

The California Emissions Estimator Model, Version 2013.2.2 (CalEEMod) was used to predict operational period emissions. Unless otherwise noted below, the model defaults for the Sonoma County were used. The Year 2015 was used for modeling, as this assumed to be the first full year after construction that the project could be operational. Annual emissions occurring after 2015 would be lower as vehicle and electricity production emission rates are anticipated to continually decrease. CalEEMod predicts emissions for mobile, areas sources, electricity consumption, natural gas combustion, electricity usage associated with water usage and wastewater discharge, and solid waste land filling and transport. Table 1 summarizes annual operational GHG emissions due to implementation of the project. Inputs to the GHG modeling are described below.

Traffic

The CalEEMod model uses mobile emission factors from the California Air Resources Board's EMFAC2011 model. Forecasted project trip generation estimates provided by W-Trans were applied. The default trip lengths and traffic mix for Sonoma County in CalEEMod were also used. Mobile emissions from planned county-wide industry events were calculated in a separate model run and were based on a reasonable worst-case scenario involving twenty-four 300-person events annually. Each event was calculated to generate 2,006 pounds of CO_2e per day, or 48,114 pounds (22 metric tons) annually.

Electricity, Natural Gas, Water Usage and Solid Waste Production

Default rates for energy consumption were assumed in the model. Emissions rates associated with electricity consumption were adjusted to account for Pacific Gas & Electric utility's (PG&E) projected 2015 CO_2 intensity rate. This 2015 rate is based, in part, on the requirement of a renewable energy portfolio standard of 33 percent by the year 2020. CalEEMod uses a default rate of 641.35 pounds of CO_2 per megawatt of electricity produced. The derived 2015 rate for PG&E was estimated at 391.16 pounds of CO_2 per megawatt of electricity delivered and is based on the California Public Utilities Commission (CPUC) GHG Calculator.[3] Note that solid waste emissions do not include any factors for waste diversion, which would reduce emissions further.

Wine Fermentation

The CalEEMod model, described above, does not account for the CO_2 emissions from wine fermentation. CO_2 is released during this process. Although this is considered a biogenic emission, they were included in this analysis. The amount of CO_2 emitted is dependent on many variables including the type of wine produced and the winemaking process. The International Wine Carbon Calculator (IWCC version 1.3) is an Excel spreadsheet that provides GHG emission estimates from various winery operations. This program was utilized to generally estimate CO_2 emissions from fermentation, since specific details of the wine making were not known. Assuming about 1,110 tons of grapes would be used to produce 60,000 cases of wine, CO_2 emissions would be about 125 metric tons per year. These emissions are offset by the carbon sequestration resulting from the growing of the grapes; however, the offset was not computed for this evaluation.

Table 1
Annual Operational GHG Emissions in Metric Tons of CO_2e

Source	Methodology	Emissions

[3] California Public Utilities Commission's GHG Calculator version 3c, October 7, 2010. Available on-line at: http://ethree.com/public_projects/cpuc2.php. Accessed: October 27, 2013.

As shown in Table 1, the proposed project would have total direct and indirect emissions that are below the GHG operational threshold (1,100 metric tons of CO_2e per year) recommended by BAAQMD for new projects. Therefore, the project's GHG emissions would *not significantly* contribute to a cumulative impact on global climate change.

* * *

This concludes our assessment of the GHG impacts from this project. If you have any questions or comments, please feel free to contact me at (707) 794-0400 x35. We appreciate the opportunity to assist you.

Sincerely,

Joshua D. Carman

Job No. 13-155

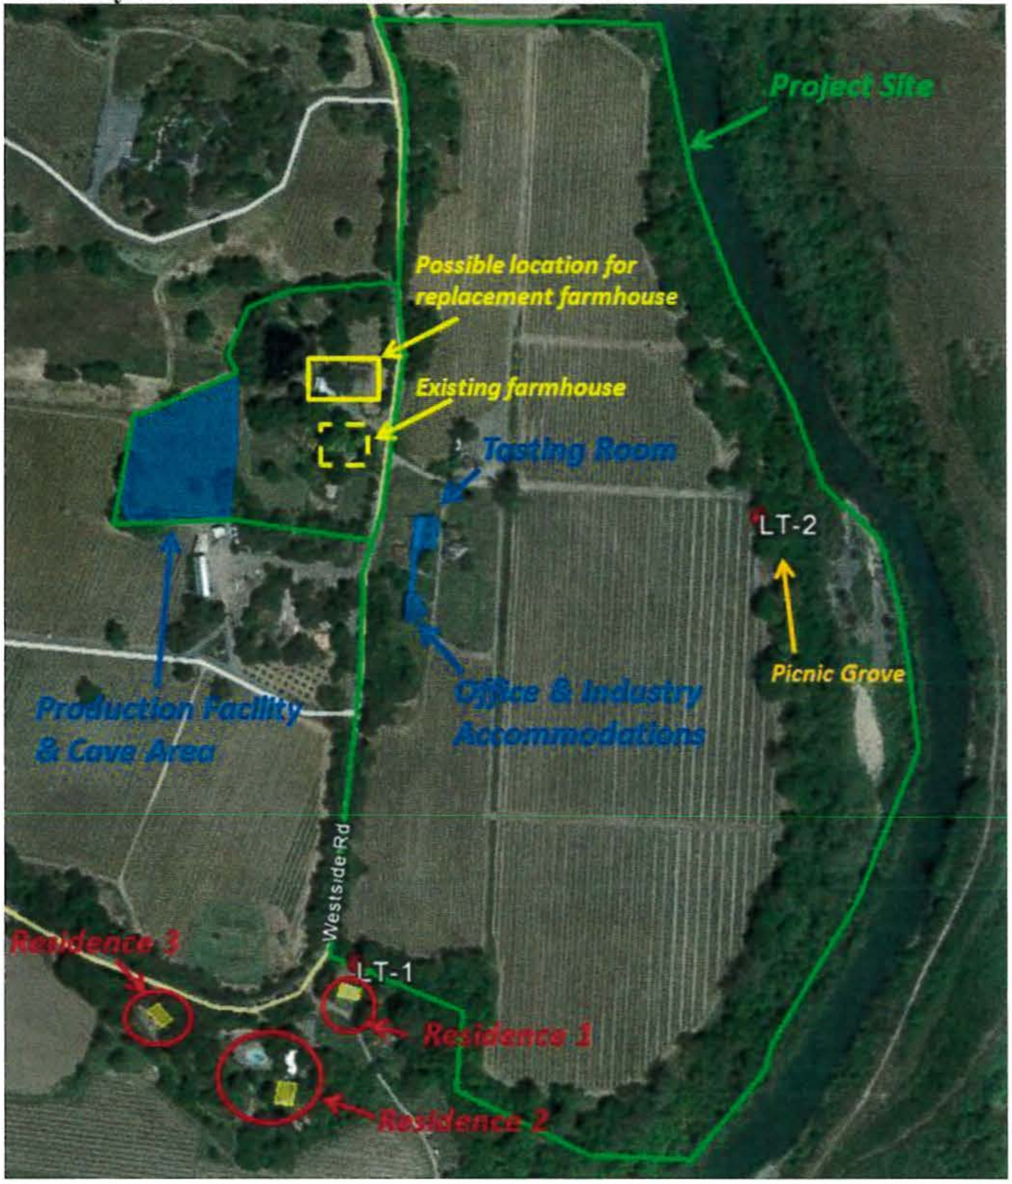
INTRODUCTION

This noise assessment evaluates the existing noise environment and the potential for increased noise as a result of the proposed Ramey Wine Cellars Project (Project) on a parcel located at 7097 Westside Road near the City of Healdsburg in an unincorporated area of Sonoma County. Figure 1 shows a site map of the property. The proposed project includes production of 60,000 cases of wine, a tasting room, retail sales, and an area designated for trade-related special events. On the eastern side of Westside Road, the existing hop kiln will be converted into a public tasting room, and the existing hop barn will be converted into a private marketing space with a kitchen and two guest rooms. The two buildings will be connected by a bridge, which will also be constructed. On the western side the roadway, a new 60,000-case winery production facility with a cave area for wine barrel storage will be constructed. These facilities will not be open to the public except by invitation. Additionally, entryways, driveways, parking, walkways and site accessibility features are included in the project.

The winery operations will include public tasting, retail sales, and trade-related special events. The staff will include fifteen employees between the winery and the tasting room. On average, 52 visitors per day is expected for tasting. The Project application includes provisions for 24 special events per year. These include 10 events with 30 people in attendance, five 60-person catered events, participation in five 120-person industry-wide events, and four 250-person outdoor events.

The winery is situated on a 75-acre parcel of land formerly occupied by Westside Farms. The property is bordered to the north by Gracianna Winery, to the northwest by Arista Winery, to the west by Williams Selyem Winery, and to the south and east by the Russian River. On the opposite side of the river is Riverfront Regional Park. To the south of the property lie single-family residences, as well. This report includes a summary of applicable noise regulations, the results of a noise monitoring survey conducted for the Project, and an assessment of noise impacts and mitigation measures necessary to meet the applicable County standards at adjacent noise sensitive land uses. Persons not familiar with environmental noise analysis are referred to Appendix A for additional discussion.

Figure 1. Winery Site Plan and Measurement Locations



REGULATORY BACKGROUND

The Sonoma County Noise Element of the 2000 General Plan identifies a goal to:

> *Protect people from the adverse effects of exposure to excessive noise and to achieve an environment in which people and land uses function without impairment from noise.*

The following policies, which are applicable for use at the Project, are intended to achieve this goal:

NE-1c: Control non-transportation-related noise from new projects. The total noise level resulting from new sources shall not exceed the standards in Table NE-2 of the recommended revised policies as measured at the exterior property line of any adjacent noise-sensitive land use. Limit exceptions to the following:

1. If the ambient noise level exceeds the standard in Table NE-2, adjust the standard to equal the ambient level, up to a maximum of five dBA above the standard, provided that no measurable increase (i.e., +/- 1.5 dBA) shall be allowed.
2. Reduce the applicable standards in Table NE-2 by five dBA for simple tone noises, noises consisting primarily of speech or music, or for recurring impulsive noises, such as pile drivers and barking dogs at kennels.
3. Reduce the applicable standards in Table NE-2 by five dBA if the proposed use exceeds the ambient level by 10 dBA or more.
4. For short-term noise sources, which are permitted to operate no more than six days per year, such as concerts or race events, the allowable noise exposures shown in Table NE-2 may be increased by five dB. These events shall be subject to a noise management plan, including provisions for maximum noise level limits, noise monitoring, complaint response, and allowable hours of operation. The plan shall address potential cumulative noise impacts from all events in the area.
5. Noise levels may be measured at the location of the outdoor activity area of the noise-sensitive land use, rather than at the exterior property line of the adjacent noise-sensitive use, where:
    a. The property on which the noise-sensitive use is located has already been substantially developed pursuant to its existing zoning, and
    b. There is available open land on these noise-sensitive lands for noise attenuation.

    Note, this exception may not be used for vacant properties, which are zoned to all noise-sensitive uses.

Table 1. Maximum Allowable Noise Exposures for Non-Transportation Sources (Table NE-2)

Hourly Noise Metric[1]	Maximum Exterior Noise Level Standards, dBA	
	Daytime: 7:00 a.m. to 10:00 p.m.	Nighttime: 10:00 p.m. to 7:00 a.m.
L_{50} (30 minutes in any hour)	50	45
L_{25} (15 minutes in any hour)	55	50
L_{08} (5 minutes in any hour)	60	55
L_{02} (1 minute in any hour)	65	60

[1] The sound level exceeded n% of the time in any hour. For example, the L_{50} is the value exceeded 50% of the time or 30 minutes in any hour; this is the median noise level. The L_{02} is the sound level exceeded one minute in any hour.

EXISTING NOISE ENVIRONMENT

AMBIENT NOISE LEVELS

The primary ambient source of noise in the project area is the traffic along Westside Road. Other contributors to noise include airplanes flying overhead and agricultural-related activities in the area. To evaluate ambient noise levels on the project site at the closest noise-sensitive land uses, an ambient noise monitoring survey, consisting of two long-term noise measurements, was conducted between 3:00 p.m. on Friday, August 23, 2013, and 5:00 p.m. on Wednesday, August

28, 2013. LT-1 was located on the southern end of the property, approximately 110 feet (34 meters) from the centerline of Westside Road. This location represents the neighboring single-family residences. LT-2 was located at the tree line on the eastern boundary of the project site. Positioned approximately 185 feet (56 meters) from the Russian River, this long-term measurement location captured ambient noise away from Westside Road, which is in the vicinity of Riverfront Regional Park. Figure 1 shows the approximate locations of both measurement sites.

The hourly trends in noise levels at LT-1 and LT-2 are shown in Figures 2 and 3, respectively. Included in each figure are the energy equivalent noise level, L_{eq}, and the statistical noise levels consistent with the limits set forth in Table NE-2 (noise levels exceeded 2, 8, 25, and 50 percent of the time).

Figure 2. Measured Noise Levels at LT-1

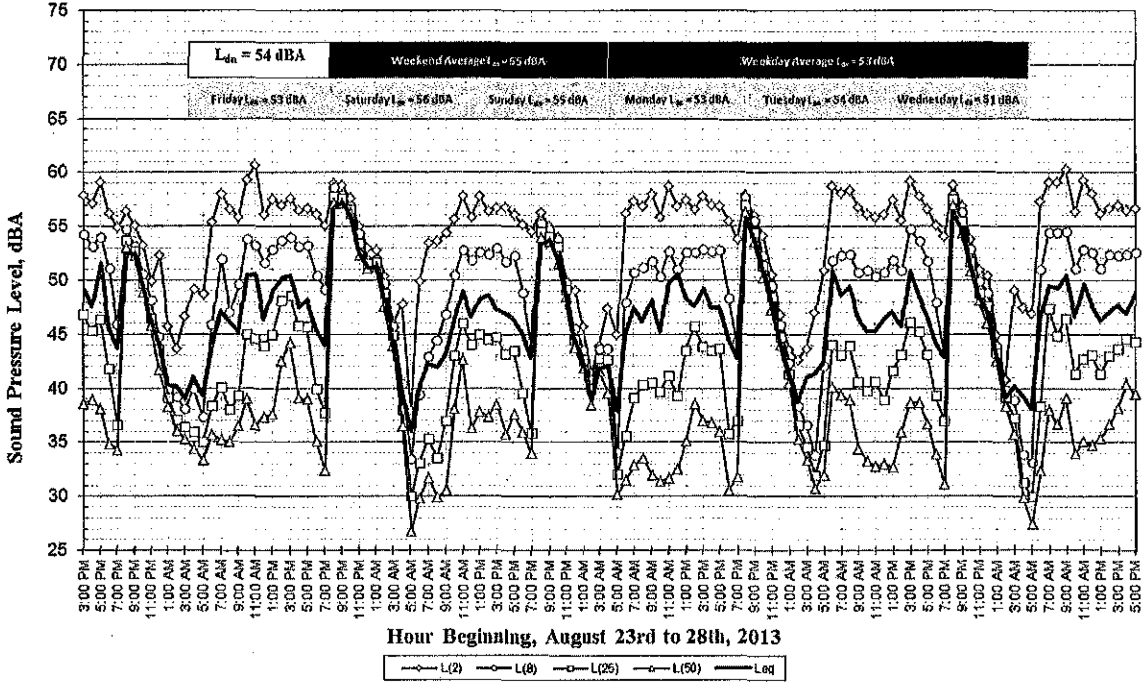


Figure 3. Measured Noise Levels at LT-2

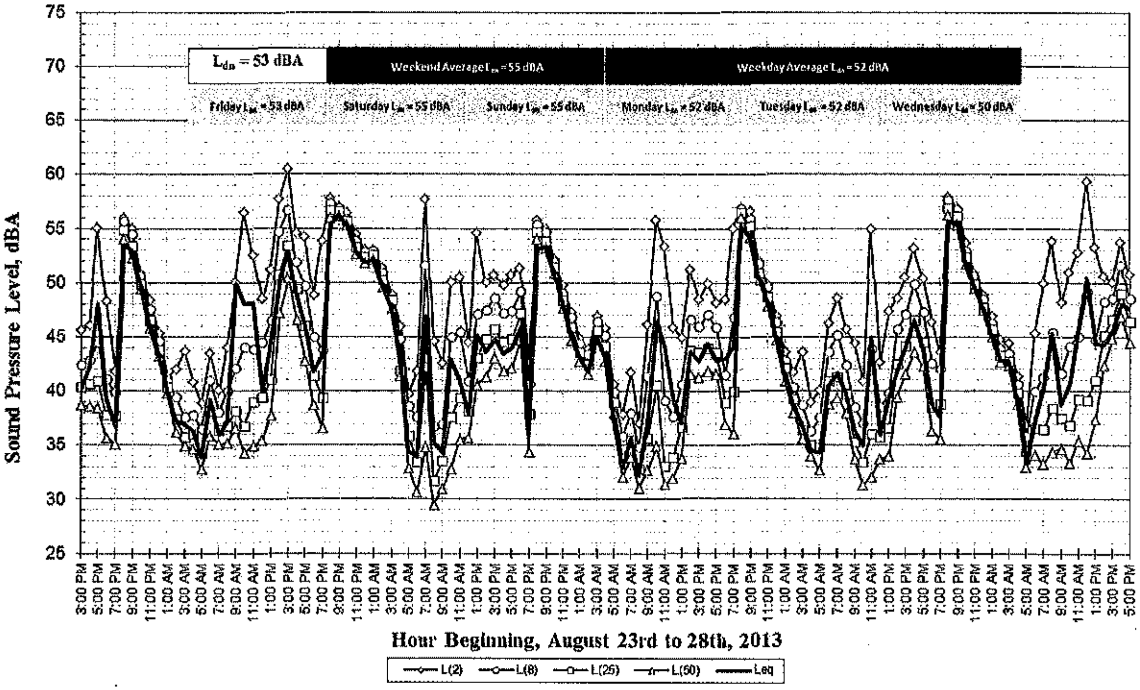

From Figure 2, the daytime L_{eq} for the weekend (i.e., Saturday and Sunday) at LT-1 ranged from 42 to 57 dBA, with an average L_{eq} of 50 dBA. The nighttime L_{eq} for the weekend at LT-1 ranged from 36 to 56 dBA, with an average L_{eq} of 49 dBA. During the weekdays (i.e., Friday, Monday, Tuesday, and Wednesday), the average daytime and nighttime averages for L_{eq} ranged from 43 to 56 dBA, with an average of 50 dBA, and from 38 to 51 dBA, with an average of 46 dBA, respectively. The day-night average noise level, which is the L_{dn}, at LT-1 measured to be 55 dBA on the weekend and 53 dBA on the weekday. The overall L_{dn} for the entire testing period was 54 dBA. The chart in Figure 2 shows the average L_{dn} for each day of testing. The daytime and nighttime noise descriptors used to interpret the County's Noise Performance Standards at LT-1 for the measurement period are shown in Table 2.

For LT-2, which is shown in Figure 3, the average L_{eq} measurements from the weekend ranged from 34 to 56 dBA in the daytime, with an average of 49 dBA, and from 34 to 55 dBA in the nighttime, with an average of 48 dBA. On the weekdays, the average L_{eq} in the daytime ranged from 32 to 56 dBA, with an average of 48 dBA. In the nighttime, the average weekday L_{eq} ranged from 33 to 52 dBA, with an average of 45 dBA. The average weekend L_{dn} was 55 dBA, and on the weekday, the L_{dn} was approximately 52 dBA. The overall L_{dn} for the entire testing period at LT-2 was 53 dBA. The calculated L_{dn} for each day of testing is shown in Figure 3. The Noise Performance Standards at LT-2 are summarized in Table 2.

In comparing the hourly noise levels for each long-term measurement location, notice that the median noise levels, L_{50}, during the nighttime hours of 10:00 p.m. to 7:00 a.m. drop well-below 30 dBA on two different occasions near the roadway at LT-1 but barely drop as low as 30 dBA at LT-2 during the same period of time. This higher nighttime ambient noise further from the roadway is likely due to nighttime woodland insect noise.

Based on the results from LT-1 and LT-2, the L_{dn} levels measured on the weekend were approximately 2 to 3 dBA higher than on the weekdays. The weekend L_{eq} levels in the daytime were approximately 0 to 1 dBA higher than the weekdays, and in the nighttime, the weekend L_{eq} levels averaged to be approximately 3 dBA higher than on the weekdays. Since winery-related noise generally occurs at the same or higher rates on the weekends, ambient noise from the weekends will be used to conduct the impact assessment for the worst-case scenario.

Table 2: Measured Ambient Noise Levels

Hourly Noise Metric	**Exterior Ambient Noise Levels**			
	LT-1 (southern property line near Westside Road Noise)		**LT-2 (eastern property line away from Westside Road Noise)**	
	Avg. Daytime Level (Range)	**Avg. Nighttime Level** (Range)	**Avg. Daytime Level** (Range)	**Avg. Nighttime Level** (Range)
L_{50} (30 Min.)	**48** (34 to 58)	**47** (30 to 57)	**48** (32 to 57)	**47** (34 to 56)
L_{25} (15 Min.)	**52** (41 to 58)	**48** (33 to 57)	**49** (35 to 58)	**48** (36 to 56)
L_{08} (5 Min.)	**53** (43 to 59)	**48** (33 to 57)	**50** (35 to 58)	**48** (36 to 56)
L_{02} (1 Min.)	**57** (53 to 61)	**51** (38 to 59)	**53** (37 to 61)	**49** (37 to 56)

NOISE ASSESSMENT

Estimating the expected noise produced by, and impacts from, the proposed project at adjacent noise-sensitive uses requires three elements: 1) identification of what noise-producing operations are likely to occur; 2) the typical noise source levels for those operations; and 3) the temporal nature of the operations.

I. Identification of Noise-Producing Operations/Uses

There are a number of operations associated with wine production and events at the proposed facility that will produce noise. These include:

1. Project traffic;
2. Winery and seasonal production operations;
3. Maintenance and forklift operations; and
4. Special event noise.

II. Typical Noise Source Levels

To estimate the noise levels associated with project operations, some attention must be given to the temporal nature of the noise produced. Below each of the major winery-related noise-producing operations outlined above are discussed:

1. *Project Traffic* would produce the following type and range of traffic noise levels:
    a. Automobile and light-vehicle traffic accessing the tasting room would occur during the daytime hours, and noise produced is expected to include the sounds of vehicles accessing parking areas, engine starts, door slams, etc. These noises typically range from a maximum of 53 to 63 dBA at 50 feet (15 meters).
    b. The majority of truck traffic on the project site is expected to primarily access the winery building on the western side of Westside Road, though some truck traffic may also access other portions of the site. Noise levels generated by truck traffic are dependent on the size and speed of trucks; typically, maximum noise levels generated

by heavy-duty (i.e., semi-tractor trailer type) trucks would range from 70 dBA when traveling at constant speeds to 75 dBA when stopping/starting and maneuvering at a distance of 50 feet (15 meters). Medium (box type and delivery) trucks would typically have maximum levels ranging from 60 dBA when traveling at constant speeds to 65 dBA when stopping/starting and maneuvering at a distance of 50 feet.

2. *Winery and Seasonal Production Operations* would produce the following type and range of noise levels:
   a. Refrigeration equipment, as a maximum condition, is assumed to operate under constant conditions during the day and night. Though the model, type, and capacities of the cooling compressors for the facility are not specified, field measurements of such equipment show that sound levels from such equipment can produce levels between 50 and 65 dBA at 50 feet, with L_{50} noise levels of 60 dBA at 50 feet.
   b. Air compressors used for various processes in the facility typically cycle on and off based on the need for compressed air. Though the model, type, and capacities of the cooling compressors for the facility are not specified, we can estimate results based on field measurements of cooling compressors at other wineries. The equipment is expected to produce L_{50} sound levels of 62 dBA at 50 feet.
   c. Bottling would be constant on an hourly basis, although it is likely to occur for only a few weeks each year. Based on sound level measurements of bottling lines at other wineries, bottling operations can be expected to produce L_{50} sound levels between 65 and 70 dBA at 50 feet.
   d. Crush activities at medium to large-sized wineries typically occur for approximately two months each year. The majority of the noise sources associated with the crush include the operation of hoppers, presses, de-stemmers, separators, crushers, air compressors, forklifts, conveyors, etc. Average noise levels resulting from the crush are typically constant on an hourly basis. Individual pieces of crush-specific equipment, such as the separators and de-stemmers, are relatively quiet with sound levels around 50 dBA L_{eq} at approximately 50 feet. The composite crush activities at a large sized winery, such as a 60,000-case capacity facility, typically generate noise levels of approximately 66 dBA L_{eq} at a distance of 50 feet from the center of operations. During the crush, discrete maximum noise events, such as the setting of empty bins, may reach 70 to 80 dBA L_{max} or L_{02} at 50 feet from the center of operations.
3. *Maintenance and Forklift Operations* would produce intermittent noise depending upon the exact nature of the operation. These would likely occur at a much slower than a daily rate; although operations may span several hours, once initiated. Backup alarms (or beepers), which are repetitive and irritating by design, would also produce noise during these activities, and as with forklift operations, are expected to be intermittent by nature. Forklift use and associated backup alarm noise would be partially attenuated during crush-related activities by structure of the production building. Based on experience with other winery operations, it can be estimated that non-attenuated L_{08} noise levels from these operations may reach levels of 66 to 67 dBA at 50 feet.
4. *Special Events Noise*, such as concerts and weddings are not planned, nor requested, at the winery. The winery does plan to participate in industry-related events, averaging approximately 24 per year. Based on review of site plans, indoor events would be held in the building connected to the tasting room by a constructed bridge or within the walnut grove at the east boundary of the site. The events building will be located across the street from the production facilities. Table 3 summarizes typical noise levels generated by small-to-moderate sized events at distances of 50 feet from the source.

Table 3: Typical Noise Source Levels for Promotional Events (A-Weighted L_{50} Levels)

Event or Activity	**Typical Noise Level @ 50 ft**
Amplified Music[1]	72 dBA
Amplified Speech	71 dBA
Non-amplified (acoustic) Music	67 dBA
Films – Voices/Music	64 dBA
Raised Conversation	64 dBA

[2] Amplified concert-type music events are not proposed – such events would increase L_{50} noise levels to 80 dBA at 50 feet.

III. Propagation of sound

The final step in estimating the project noise levels is assessing the propagation of sound to the sensitive receptors. To do this, it is necessary to assume some rate of sound attenuation between the operations and receiver locations. The most dominant physical effect is due to the spreading out of sound waves with distance. For simple, single sources, such as fixed equipment and stationary truck operations, the divergence of the sound wave is hemispherical in nature, producing a reduction of 6 dB with each doubling of distance. For moving sources of noise, such as automobile traffic or truck movements, which are considered linear sources of noise, the divergence of the sound wave is cylindrical in nature, producing a reduction of 3 to 4 ½ dB with each doubling of distance. Other effects can modify these fall-off rates, such as partial shielding from buildings or topography, atmospheric attenuation of sound, ground absorption, and meteorological effects. These effects almost always reduce the noise, in addition to that due to sound divergence. As most of these effects will vary with time due to changing environmental conditions, it is most conservative to assume only attenuation due to divergence for outdoor activities and conservative (minimal) rate of structural attenuation (12 dBA) when operations are conducted within buildings, realizing that the actual noise level will be at or, most likely, below those predicted using this assumption at any one time.

To evaluate noise impacts on area noise sensitive uses, noise levels were propagated to three representative residences. There is also an existing farmhouse on the project site to the west of Westside Road. This residence is to be demolished, and therefore, does not require noise propagation calculations. Noise propagation calculations were completed on the following residences (see Figure 1 for locations):

1. *Residence 1*: This residence is located in the vicinity of LT-1. It is south of the project site on the same side of Westside Road as the tasting room and event barn and therefore on the opposite side as the wine production building. The residence is approximately 75 feet (23 meters) from the centerline of Westside Road. The front yard of this home is represented by the calculated noise levels for monitoring position LT-1.
2. *Residence 2*: This residence is also located to the south of the project site. Residence 2 is also south of Residence 1 and slightly west. Since Westside Road turns westward just south of Residence 1, the alignment of Residence 2 is such that it is located directly south of the wine production building. This property includes an outdoor pool area that is approximately 100 to 170 feet (30 to 52 meters) from the centerline of Westside Road. The front yard of the home ranges from 52 to 180 feet (16 to 55 meters) from the centerline of the roadway, and the front façade of the home is 190 to 215 feet (58 to 66 meters) from the roadway centerline. Due to the proximity of the home to LT-1, the calculated noise levels at this monitoring location are represented by LT-1 minus 3 dBA.
3. *Residence 3*: While on the same side of Westside Road as Residences 1 and 2, the geometry of the roadway is such that Residence 3 is southwest of the wine production building.

Positioned approximately 50 to 75 feet (15 to 23 meters) from the centerline of Westside Road, this home is also best represented by LT-1 plus 3 dBA.

Ambient noise levels at these residences under worst case (i.e., weekend) conditions were calculated using the sound level differences noted above and the measurement results shown in Table 2 for the long-term noise measurement, LT-1. Table 4 summarizes the calculated levels for all four residences.

Table 4. Calculated Ambient Noise Levels at Adjacent Noise-Sensitive Uses

Hourly Noise Metric	Exterior Ambient Noise Levels, dBA					
	Residence 1		Residence 2		Residence 3	
	Avg. Daytime Level	Avg. Nighttime Level	Avg. Daytime Level	Avg. Nighttime Level	Avg. Daytime Level	Avg. Nighttime Level
L_{50} (30 min.)	48	47	45	44	51	50
L_{25} (15 min.)	52	48	49	45	55	51
L_{08} (5 min.)	53	48	50	45	56	51
L_{02} (1 min.)	57	51	54	48	60	54

IMPACT ASSESSMENT

Impact 1: Traffic, Parking Lot and Truck Noise

Automobile parking and traffic

On the east side Westside Road where the tasting room and office and industry accommodations are located, the existing driveways and parking areas will be used. The parking lot will be enhanced, but the general location will remain the same. Residence 1 (represented by LT-1 at the southern boundary of the winery property) is approximately 960 feet from the nearest parking area; Residences 2 (located further south of LT-1 along Westside Road) and 3 (located to the west of LT-1, also along Westside Road) are approximately 1,220 and 1,210 feet, respectively, from the nearest parking area. Based on these distances, noise generated by automobile and light vehicles would be between 28 and 38 dBA at Residence 1 and between 25 and 35 dBA at both Residences 2 and 3. Given the expected visitor and employee use, these activities are expected to occur for less than five minutes out of an hour on a typical day and fall in the L_{02} NE-2 daytime category of 65 dBA (see Table 1). However, during events or on busy weekends, such activities may occur more frequently and fall in the L_{08} NE-2 daytime category of 60 dBA. The ambient noise environment in this area is described by measurements at site LT-1. Table 5 summarizes the assessment of automobile noise in driveways and in parking lots.

Based on this finding, noise levels associated with automobiles and light vehicles using the project driveways and parking lots would not exceed the daytime NE-2 noise standards at the nearest residences.

Table 5. Driveway and Parking Lot Automobile L_{08} Noise Levels

	L_{08} (Noise Level Exceeded 5 minutes in Any Hour), dBA		
	Residence 1	**Residence 2**	**Residence 3**
Unadjusted Table NE-2 Daytime Limit	60	60	60
Daytime Ambient Noise Levels	53	50	56
Ambient Exceeds NE-2 Limit	No	No	No
NE-2 Adjustment	+0	+0	+0
Driveway/Parking Lot Noise at Receiver	**28 to 38**	**25 to 35**	**25 to 35**
Operations Exceed Ambient by 10 dBA?	No	No	No
NE-2 Adjustment	+0	+0	+0
Adjusted Table NE-2 Daytime Limit	60	60	60
Driveway/Parking Noise Exceeds NE-2?	No	No	No

Truck traffic

Trucks visiting the winery site will use the new driveway to access the wine production facility on the west side of the roadway. This main winery access path will take constant speed and maneuvering trucks within respective distances of approximately 1,170 to 1,335 feet of Residence 1, 1,290 to 1,595 feet of Residence 2, and 1,200 to 1,515 feet of Residence 3. Using these distances, noise generated by heavy-duty trucks may range from 48 to 56 dBA at Residence 1 and from 47 to 55 dBA at both Residences 2 and 3. The noise generated by medium-duty trucks ranged from 38 to 46 dBA at Residence 1 and from 37 to 45 dBA at Residences 2 and 3. Truck operations are expected to occur during daytime hours only and on a basis of one to five minutes per hour, or less, since it is unlikely that more than one heavy truck would arrive and depart during any given hour. Thus, truck operations would fall in the L_{02} NE-2 category of 65 dBA (see Table 1) at the adjacent residential uses. Table 6, below, presents and summarizes the assessment of truck traffic noise.

Based on these findings, noise associated with truck traffic at the project is not expected to exceed daytime NE-2 noise standards at the nearest residences.

Table 6. Truck L_{02} Noise Levels

	L_{02} (Noise Level Exceeded 1 minute in Any Hour), dBA		
	Residence 1	**Residence 2**	**Residence 3**

NE-2 Adjustment	+0	+0	+0
Adjusted Table NE-2 Daytime Limit	65	65	65
Truck Traffic Noise Exceeds NE-2?	No	No	No

Mitigation 1: None Needed

Impact 2: Mechanical Equipment Noise

The project would likely include noise-generating mechanical equipment, such as air-cooled condensing units, pumps, and compressors, at the wine production facility, as well as less-significant sources of noise, such as air-conditioning systems and exhaust fans. The project description and drawings do not indicate the location of such equipment. This equipment may be located within the structures or positioned so that the structures provide shielding for noise caused by the equipment. However, considering a worst case scenario where the equipment is placed outside of production buildings and not shielded from the adjacent residences, the equipment may be located as close as 1,210 feet from Residence 1, as 1,300 feet from Residence 2, and as close as 1,170 feet from Residence 3.

Using the source levels discussed above and a 6 dB sound reduction for each doubling of the distance between the noise source and the receivers, constant L_{50} noise levels from mechanical equipment may be between an L_{50} of 32 and 34 dBA at Residences 1 and 2 and between an L_{50} of 33 and 35 dBA at Residence 3. Table 7, below, summarizes the assessment of mechanical equipment noise.

Table 7. Mechanical Equipment L_{50} Noise Levels

	L_{50} (Noise Level Exceeded 30 minutes in Any Hour), dBA		
	Residence 1	**Residence 2**	**Residence 3**
Unadjusted Table NE-2 Daytime Limit	50	50	50
Daytime Ambient Noise Levels	48	45	51
Daytime Ambient Exceeds NE-2 Limit?	No	No	**Yes**
Daytime NE-2 Adjustment	+0	+0	+1
Unadjusted Table NE-2 Nighttime Limit	45	45	45
Nighttime Ambient Noise Levels	47	44	50
Nighttime Ambient Exceeds NE-2 Limit?	**Yes**	No	**Yes**
Nighttime NE-2 Adjustment	+2	+0	+5
Mechanical Equipment Noise at Receiver	**32 to 34**	**32 to 34**	**33 to 35**
Operations Exceed Ambient by 10 dBA?	No (day & night)	No (day & night)	No (day & night)
NE-2 Adjustment	+0 (day & night)	+0 (day & night)	+0 (day & night)
Adjusted Table NE-2 Daytime Limit	50	50	51
Adjusted Table NE-2 Nighttime Limit	47	45	50
Mechanical Equipment Noise Exceeds NE-2?	No (day & night)	No (day & night)	No (day & night)

Based on these findings, noise associated with mechanical equipment is not expected to exceed daytime or nighttime NE-2 noise standard at the nearest residences.

Mitigation 2: None Needed

Impact 3: Crush-Related Noise

Annual crush-related activities would take place within the new wine production building. The crush pad & press equipment room will be located on the first floor and on the western side of the building, which indicates considerable shielding of crush-related noise by the building itself from the nearby residences. Based on the Winery Floor Plans provided, the space above the crush pad will be open to the second floor, but it is unclear if the area will be open or closed to nature. Assuming the worst case scenario, crush-related activities will be considered to occur outdoors. From the plans for the project site and the building plans, the future location of the crush pad was estimated, and using Google Earth, the distances to the each residence was approximated. The crush pad will be within 1,280 feet of Residence 1, within 1,400 feet of Residence 2 and within 1,275 feet of Residence 3. Using the source levels discussed above and a 6 dB sound reduction for each doubling of the distance, constant L_{50} noise levels from crush-related activities would be approximately 38 dBA at Residence 1, 37 dBA at Residence 2, and 38 dBA at Residence 3. Table 8, below, summarizes these calculations. The maximum noise events discussed above, such as bin drops, etc., would be an L_{02} of 42 to 52 dBA at Residence 1, 41 to

51 dBA at Residence 2, and 42 to 52 dBA at Residence 3. Table 9 summarizes the maximum noise events assessment of crush-related activities.

Based on the findings shown, noise associated with crush related noise is not expected to exceed daytime or nighttime NE-2 noise standard at the nearest residences.

Mitigation 3: None Needed

Impact 4: Bottling Noise

According to the building floor plans provided, bottling will be done in the production facility area, next to the truck access loading zone. The building will provide shielding from noise created during bottling activities. The distances from the bottling area to the nearby residences are as follows: 1,225 feet from Residence 1, 1,345 feet from Residence 2, and 1,200 feet from Residence 3. Based on these distances and the noise shielding, noise from bottling activities are expected to be an L_{50} of 37 to 42 dBA at Residence 1, an L_{50} of 36 to 41 dBA at Residence 2, and an L_{50} of 37 to 42 dBA at Residence 3. Table 10 summarizes the assessment of bottling noise.

Table 10. Bottling L_{50} Noise Levels

	L_{50} (Noise Level Exceeded 30 minutes in Any Hour), dBA		
	Residence 1	**Residence 2**	**Residence 3**
Unadjusted Table NE-2 Daytime Limit	50	50	50
Daytime Ambient Noise Levels	48	45	51
Daytime Ambient Exceeds NE-2 Limit?	No	No	Yes
Daytime NE-2 Adjustment	+0	+0	+1
Unadjusted Table NE-2 Nighttime Limit	45	45	45

Adjusted Table NE-2 Nighttime Limit	47	45	50
Bottling Noise Exceeds NE-2?	No (day & night)	No (day & night)	No (day & night)

Based on these findings, noise associated with bottling is not expected to exceed daytime or nighttime NE-2 noise standard at any of the adjacent residences.

Mitigation 4: None Needed

Impact 5: Maintenance and Forklift Operations

Forklift and maintenance operations would likely take place on the first floor inside the new winery building, in the outdoor crushing and receiving areas, and possibly in the winery caves. Such activities within the winery building would receive significant noise shielding from the building and are not analyzed here. The crushing area would also receive considerable shielding from the building. Outdoor forklift and maintenance operations are considered a worst-case condition and are analyzed. Based on a review of project drawings, the outdoor area closest to the adjacent residences would be the receiving area/truck access, which was mentioned above as being within 1,335 feet of Residence 1, within 1,595 feet of Residence 2, and within 1,515 feet of Residence 3. Using the source levels discussed above and a 6 dB sound reduction for each doubling of the distance between the noise source and the receivers, noise from forklift and maintenance operations activities are expected to be an L_{08} of between 37 and 38 dBA at Residence 1 and an L_{08} of between 36 and 37 dBA at Residences 2 and 3. Table 11, following, summarizes the assessment of noise due to forklift and maintenance operations. Note, forklift and maintenance operations will only occur during the daytime hours.

Table 11. Forklift and Maintenance L_{08} Noise Levels

	L_{08} (Noise Level Exceeded 5 minutes in Any Hour), dBA

NE-2 Adjustment	+0	+0	+0
Adjusted Table NE-2 Daytime Limit	60	60	60
Forklift/Maintenance Operations Noise Exceed NE-2?	No	No	No

Based on these findings, noise associated with forklift and maintenance operations is not expected to exceed daytime NE-2 noise standard at the nearest residences.

Mitigation 5: None Needed

Impact 6: Event Noise at adjacent residential uses
Special events, such as concerts and weddings, are not planned, nor requested at the winery; however, the winery does plan to participate in county-wide industry events. The project application includes provisions for 24 special events per year, including 10 events with 30 persons in attendance, five 60-person catered events, participation in five 120-person industry-wide events, and four 250-person outdoor events. For an event consisting of 250 persons, a staff of approximately 12 people is expected.

A review of the project site plans indicates that outdoor events may be held either on the east side of Westside Road in the vicinity of the tasting room and barn or in the picnic grove area located along the eastern boundary of the property near LT-2. Indoor events would be held inside the tasting room or barn. The production facility on the west side of the roadway will only be opened to guests by invitation only. Events occurring within the winery buildings would receive noise shielding from the building structures estimated at 12 dBA (assuming open windows and/or doors). However, the outdoor events held in the garden area or yard between the tasting room/barn and Westside Road, in the yard south of the barn, in the yard east of the barn, or in the picnic grove area would receive little to no noise attenuation from intervening terrain or building structures at Residences 1, 2, and 3. The outdoor area between the tasting room and the barn would have some shielding from the barn structure.

Based on a review of aerial photos and the project site plan, distance information obtained using Google Earth indicates that outdoor events that take place around the tasting room and events barn could be situated as close as 690 feet from Residence 1, 900 feet from Residence 2, and 915 feet from Residence 3. The outdoor events taking place in the picnic grove area would be approximately 1,525 feet from Residence 1, 1,775 feet from Residence 2, and 1,900 feet from Residence 3. The event space and guest rooms located in the barn are the closest indoor rooms for events. From the maps, indoor events at these locations would be as close as 885 feet from Residence 1, 1,100 feet from Residence 2, and 1,110 feet from Residence 3. Using these distances and the noise shielding considerations for outdoor and indoor events, the L_{50} sound levels for the typical noise source levels listed in Table 3 for outdoor and indoor events have been calculated at Residences 1, 2, and 3. Tables 12 and 13 summarize the assessments for outdoor special events noise around the winery and in the picnic grove area, respectively. Table 14 summarizes the assessment for the indoor special events noise.

Table 12. Outdoor Special Events L_{50} Noise Levels in the Vicinity of the Winery

NE-2 Limits, Ambient Noise Levels, and Adjustments	**L_{50} (Noise Level Exceeded 30 minutes in Any Hour), dBA**

Based on the findings shown in Table 12, all daytime and nighttime outdoor events would exceed County NE-2 standards at Residences 1, 2, and 3 in the amplified music and speech categories, except amplified speech during daytime hours at Residence 3. Additionally, non-amplified music NE-2 standards would also be exceeded at nighttime at Residences 1 and 2.

Based on the findings shown in Table 13, the only County NE-2 standard that would be exceeded during an outdoor event in the picnic grove area, as measured at Residence 2, would be amplified music in the nighttime. And note that this only standard would be exceeded by only one dBA. There are no calculations shown in Table 13 during the daytime hours that would exceed the County NE-2 standards at any residence.

Table 14. Indoor Special Events L_{50} Noise Levels

Based on the findings shown in Table 14, daytime or nighttime indoor events with amplified music, amplified speech, non-amplified music, films, or raised conversations would not exceed the County NE-2 standards at any of the three adjacent residences.

Mitigation 6: Special/Promotional Events

The findings above show that during outdoor events taking place near the winery buildings, amplified music and speech exceed the County NE-2 standards at Residences 1 and 2, during the daytime and nighttime. At Residence 3, the amplified music standard would be exceeded during the daytime and nighttime, as well as the amplified speech standard in the nighttime. Additionally, the non-amplified music standard would also be exceeded in the nighttime hours at Residences 1 and 2. In the picnic grove area, however, the only County NE-2 standard that would be exceeded is amplified music at nighttime. This would occur only at Residence 2. Since even noise has the potential to result in levels exceeding the standard fairly significantly, the following measures should be included in the project:

1. Amplified music and speech at events should only occur during daytime hours within the events barn or tasting room buildings or in the picnic grove.
2. Outdoor events in the vicinity of the winery with non-amplified outdoor music and/or speech may occur outdoors only during daytime hours (7:00 a.m. to 10:00 p.m.).
3. Any outdoor event occurring beyond 10:00 p.m. should be moved indoors.

4. A noise management plan should be developed for daytime outdoor events with amplified music to allow for these events to be held in accordance with provision 4 of NE-1c of the Sonoma County Noise Element. Through this provision, allowable noise exposures can increase by 5 dB. As such, up to six daytime events with amplified music would be allowed, as predicted noise levels would fall at or below the short-term noise source limit.

APPENDIX A:
FUNDAMENTAL CONCEPTS OF ENVIRONMENTAL ACOUSTICS

Noise may be defined as unwanted sound. Noise is usually objectionable because it is disturbing or annoying. The objectionable nature of sound may be caused by either its *pitch* or its loudness. *Pitch* is the height or depth of a tone or sound, depending on the relative rapidity (frequency) of the vibrations by which it is produced. Higher pitched signals sound louder to humans than sounds with a lower pitch. *Loudness* is intensity of sound waves combined with the reception characteristics of the ear. Intensity may be compared with the height of an ocean wave in that it is a measure of the amplitude of the sound wave.

In addition to the concepts of pitch and loudness, there are several noise measurement scales that are used to describe noise in a particular location. *A decibel (dB)* is a unit of measurement that indicates the relative amplitude of a sound. The zero on the decibel scale is based on the lowest sound level that the healthy, unimpaired human ear can detect. Sound levels in decibels are calculated on a logarithmic basis. An increase of 10 decibels represents a ten-fold increase in acoustic energy, while 20 decibels is 100 times more intense, 30 decibels is 1,000 times more intense, etc. There is a relationship between the subjective noisiness or loudness of a sound and its intensity. Each 10-decibel increase in sound level is perceived as approximately a doubling of loudness over a fairly wide range of intensities. Technical terms are defined in Table 1. There are several methods of characterizing sound. The most common in California is the *A-weighted sound level or dBA.* This scale gives greater weight to the frequencies of sound to which the human ear is most sensitive. Representative outdoor and indoor noise levels in units of dBA are shown in Table 2.

Because sound levels can vary markedly over a short period of time, a method for describing either the average character of the sound or the statistical behavior of the variations must be utilized. Most commonly, environmental sounds are described in terms of an average level that has the same acoustical energy as the summation of all the time-varying events. This energy-equivalent sound/noise descriptor is called L_{eq}. The most common averaging period is hourly, but L_{eq} can describe any series of noise events of arbitrary duration.

The scientific instrument used to measure noise is the sound level meter. Sound level meters can accurately measure environmental noise levels to within about plus or minus 1 dBA. Various computer models are used to predict environmental noise levels from sources, such as roadways and airports. The accuracy of the predicted models depends upon the distance the receptor is from the noise source. Close to the noise source, the models are accurate to within about plus or minus 1 to 2 dBA.

TERM	DEFINITIONS
Decibel, dB	A unit describing the amplitude of sound, equal to 20 times the logarithm to the base 10 of the ratio of the pressure of the sound measured to the reference pressure, which is 20 micropascals (20 micronewtons per square meter).
Frequency, Hz	The number of complete pressure fluctuations per second above and below atmospheric pressure.
A-Weighted Sound Level, dBA	The sound pressure level in decibels as measured on a sound level meter using the A-weighting filter network. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear and correlates well with subjective reactions to noise. All sound levels in this report are A-weighted, unless reported otherwise.
L_{01}, L_{10}, L_{50}, L_{90}	The A-weighted noise levels that are exceeded 1%, 10%, 50%, and 90% of the time during the measurement period.
Equivalent Noise Level, L_{eq}	The average A-weighted noise level during the measurement period.
Day/Night Noise Level, L_{dn}	The average A-weighted noise level during a 24-hour day, obtained after addition of 10 decibels to levels measured in the night between 10:00 pm and 7:00 am.
L_{max}, L_{min}	The maximum and minimum A-weighted noise level during the measurement period.
Ambient Noise Level	The composite of noise from all sources near and far. The normal or existing level of environmental noise at a given location.
Intrusive	That noise which intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of a sound depends upon its amplitude, duration, frequency, and time of occurrence and tonal or informational content as well as the prevailing ambient noise level.

Definitions Of Acoustical Terms **Table 1**

ILLINGWORTH & RODKIN, INC./Acoustical Engineers

Since the sensitivity to noise increases during the evening and at night -- because excessive noise interferes with the ability to sleep -- 24-hour descriptors have been developed that incorporate artificial noise penalties added to quiet-time noise events. The *Day/Night Average Sound Level, Ldn,* is a measure of the cumulative noise exposure in a community, with a 10 dB penalty added to nighttime (10:00 pm - 7:00 am) noise levels.

At a Given Distance From Noise Source	A-Weighted Sound Level in Decibels	Noise Environments	Subjective Impression
	140		
Civil Defense Siren (100')	130		
Jet Takeoff (200')	120		Pain Threshold
	110	Rock Music Concert	
Diesel Pile Driver (100')	100		Very Loud
	90	Boiler Room	
Freight Cars (50')		Printing Press Plant	
Pneumatic Drill (50')	80		
Freeway (100')		In Kitchen With Garbage	
Vacuum Cleaner (10')	70	Disposal Running	Moderately Loud
	60	Data Processing Center	
Light Traffic (100')	50	Department Store	
Large Transformer (200')			
	40	Private Business Office	Quiet
Soft Whisper (5')	30	Quiet Bedroom	
	20	Recording Studio	
	10		Threshold of Hearing
	0		

Typical Sound Levels Measured In The Environment And Industry **Table 2**

ILLINGWORTH & RODKIN, INC./Acoustical Engineers

Effects of Noise

Sleep and Speech Interference: The thresholds for speech interference indoors are about 45 dBA if the noise is steady and above 55 dBA if the noise is fluctuating. Outdoors the thresholds are about 15 dBA higher. Steady noise of sufficient intensity; above 35 dBA, and fluctuating noise levels above about 45 dBA have been shown to affect sleep. Interior residential standards for multi-family dwellings are set by the State of California at 45 dBA L_{dn}. Typically, the highest steady traffic noise level during the daytime is

about equal to the L_{dn} and nighttime levels are 10 dBA lower. The standard is designed for sleep and speech protection and most jurisdictions apply the same criterion for all residential uses. Typical structural attenuation is 12-17 dBA with open windows. With closed windows in good condition, the noise attenuation factor is around 20 dBA for an older structure and 25 dBA for a newer dwelling. Sleep and speech interference is therefore possible when exterior noise levels are about 57-62 dBA L_{dn} with open windows and 65-70 dBA L_{dn} if the windows are closed. Levels of 55-60 dBA are common along collector streets and secondary arterials, while 65-70 dBA is a typical value for a primary/major arterial. Levels of 75-80 dBA are normal noise levels at the first row of development outside a freeway right-of-way. In order to achieve an acceptable interior noise environment, bedrooms facing secondary roadways need to be able to have their windows closed, those facing major roadways and freeways typically need special glass windows.

Annoyance: Attitude surveys are used for measuring the annoyance felt in a community for noises intruding into homes or affecting outdoor activity areas. In these surveys, it was determined that the causes for annoyance include interference with speech, radio and television, house vibrations, and interference with sleep and rest. The L_{dn} as a measure of noise has been found to provide a valid correlation of noise level and the percentage of people annoyed. People have been asked to judge the annoyance caused by aircraft noise and ground transportation noise. There continues to be disagreement about the relative annoyance of these different sources. When measuring the percentage of the population highly annoyed, the threshold for ground vehicle noise is about 55 dBA L_{dn}. At an L_{dn} of about 60 dBA, approximately 2 percent of the population is highly annoyed. When the L_{dn} increases to 70 dBA, the percentage of the population highly annoyed increases to about 12 percent of the population. There is, therefore, an increase of about 1 percent per dBA between an L_{dn} of 60-70 dBA. Between an L_{dn} of 70-80 dBA, each decibel increase increases by about 2 percent the percentage of the population highly annoyed. People appear to respond more adversely to aircraft noise. When the L_{dn} is 60 dBA, approximately 10 percent of the population is believed to be highly annoyed. Each decibel increase to 70 dBA adds about 2 percentage points to the number of people highly annoyed. Above 70 dBA, each decibel increase results in about a 3 percent increase in the percentage of the population highly annoyed.

ENVIRONMENTAL NOISE ASSESSMENT RAMEY WINERY PROJECT 7097 WESTSIDE ROAD SONOMA COUNTY, CALIFORNIA

October 9, 2013
Revised October 2, 2014

Revised in 2015.

Job No. 13-155

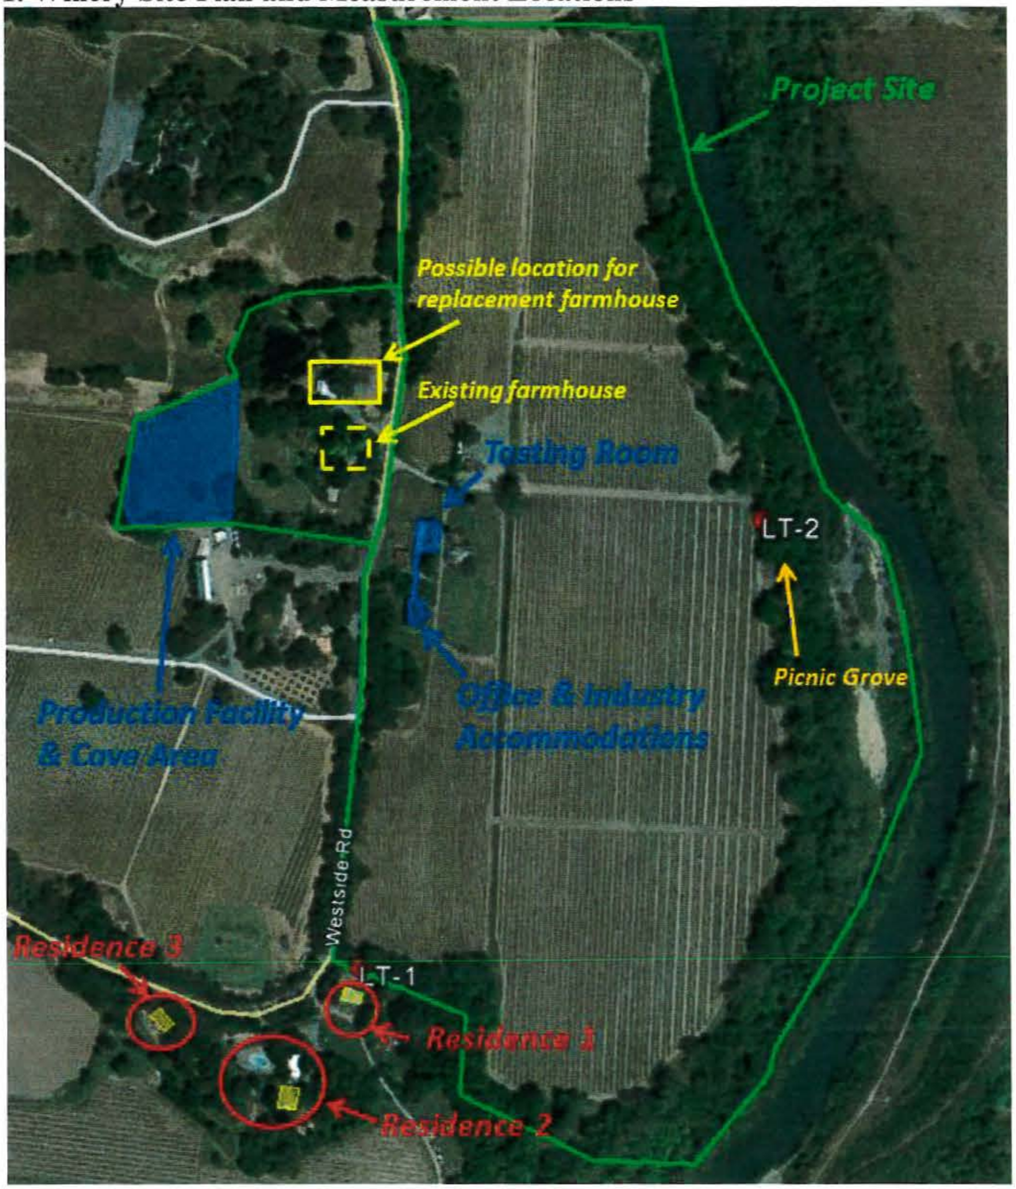
INTRODUCTION

This noise assessment evaluates the existing noise environment and the potential for increased noise as a result of the proposed Ramey Wine Cellars Project (Project) on a parcel located at 7097 Westside Road near the City of Healdsburg in an unincorporated area of Sonoma County. Figure 1 shows a site map of the property. The proposed project includes production of 60,000 cases of wine, a tasting room, retail sales, and an area designated for trade-related special events. On the eastern side of Westside Road, the existing hop kiln will be converted into a public tasting room, and the existing hop barn will be converted into a private marketing space with a kitchen and two guest rooms. The two buildings will be connected by a bridge, which will also be constructed. On the western side the roadway, a new 60,000-case winery production facility with a cave area for wine barrel storage will be constructed. These facilities will not be open to the public except by invitation. Additionally, entryways, driveways, parking, walkways and site accessibility features are included in the project.

The winery operations will include public tasting, retail sales, and trade-related special events. The staff will include fifteen employees between the winery and the tasting room. On average, 52 visitors per day is expected for tasting. The Project application includes provisions for 24 special events per year. These include 10 events with 30 people in attendance, five 60-person catered events, participation in five 120-person industry-wide events, and four 300-person outdoor events.

The winery is situated on a 75-acre parcel of land formerly occupied by Westside Farms. The property is bordered to the north by Gracianna Winery, to the northwest by Arista Winery, to the west by Williams Selyem Winery, and to the south and east by the Russian River. On the opposite side of the river is Riverfront Regional Park. To the south of the property lie single-family residences, as well. This report includes a summary of applicable noise regulations, the results of a noise monitoring survey conducted for the Project, and an assessment of noise impacts and mitigation measures necessary to meet the applicable County standards at adjacent noise sensitive land uses. Persons not familiar with environmental noise analysis are referred to Appendix A for additional discussion.

Figure 1. Winery Site Plan and Measurement Locations



REGULATORY BACKGROUND

The Sonoma County Noise Element of the 2000 General Plan identifies a goal to:

> *Protect people from the adverse effects of exposure to excessive noise and to achieve an environment in which people and land uses function without impairment from noise.*

The following policies, which are applicable for use at the Project, are intended to achieve this goal:

NE-1c: Control non-transportation-related noise from new projects. The total noise level resulting from new sources shall not exceed the standards in Table NE-2 of the recommended revised policies as measured at the exterior property line of any adjacent noise-sensitive land use. Limit exceptions to the following:

1. If the ambient noise level exceeds the standard in Table NE-2, adjust the standard to equal the ambient level, up to a maximum of five dBA above the standard, provided that no measurable increase (i.e., +/- 1.5 dBA) shall be allowed.
2. Reduce the applicable standards in Table NE-2 by five dBA for simple tone noises, noises consisting primarily of speech or music, or for recurring impulsive noises, such as pile drivers and barking dogs at kennels.
3. Reduce the applicable standards in Table NE-2 by five dBA if the proposed use exceeds the ambient level by 10 dBA or more.
4. For short-term noise sources, which are permitted to operate no more than six days per year, such as concerts or race events, the allowable noise exposures shown in Table NE-2 may be increased by five dB. These events shall be subject to a noise management plan, including provisions for maximum noise level limits, noise monitoring, complaint response, and allowable hours of operation. The plan shall address potential cumulative noise impacts from all events in the area.
5. Noise levels may be measured at the location of the outdoor activity area of the noise-sensitive land use, rather than at the exterior property line of the adjacent noise-sensitive use, where:
    a. The property on which the noise-sensitive use is located has already been substantially developed pursuant to its existing zoning, and
    b. There is available open land on these noise-sensitive lands for noise attenuation.

    Note, this exception may not be used for vacant properties, which are zoned to all noise-sensitive uses.

Table 1. Maximum Allowable Noise Exposures for Non-Transportation Sources (Table NE-2)

Hourly Noise Metric[1]	Maximum Exterior Noise Level Standards, dBA	
	Daytime: 7:00 a.m. to 10:00 p.m.	Nighttime: 10:00 p.m. to 7:00 a.m.
L_{50} (30 minutes in any hour)	50	45
L_{25} (15 minutes in any hour)	55	50
L_{08} (5 minutes in any hour)	60	55
L_{02} (1 minute in any hour)	65	60

[1] The sound level exceeded n% of the time in any hour. For example, the L_{50} is the value exceeded 50% of the time or 30 minutes in any hour; this is the median noise level. The L_{02} is the sound level exceeded one minute in any hour.

EXISTING NOISE ENVIRONMENT

AMBIENT NOISE LEVELS

The primary ambient source of noise in the project area is the traffic along Westside Road. Other contributors to noise include airplanes flying overhead and agricultural-related activities in the area. To evaluate ambient noise levels on the project site at the closest noise-sensitive land uses, an ambient noise monitoring survey, consisting of two long-term noise measurements, was conducted between 3:00 p.m. on Friday, August 23, 2013, and 5:00 p.m. on Wednesday, August 28, 2013. LT-1 was located on the southern end of the property, approximately 110 feet (34 meters) from the centerline of Westside Road. This location represents the neighboring single-family residences. LT-2 was located at the tree line on the eastern boundary of the project site. Positioned approximately 185 feet (56 meters) from the Russian River, this long-term measurement location captured ambient noise away from Westside Road, which is in the vicinity of Riverfront Regional Park. Figure 1 shows the approximate locations of both measurement sites.

The hourly trends in noise levels at LT-1 and LT-2 are shown in Figures 2 and 3, respectively. Included in each figure are the energy equivalent noise level, L_{eq}, and the statistical noise levels consistent with the limits set forth in Table NE-2 (noise levels exceeded 2, 8, 25, and 50 percent of the time).

Figure 2. Measured Noise Levels at LT-1

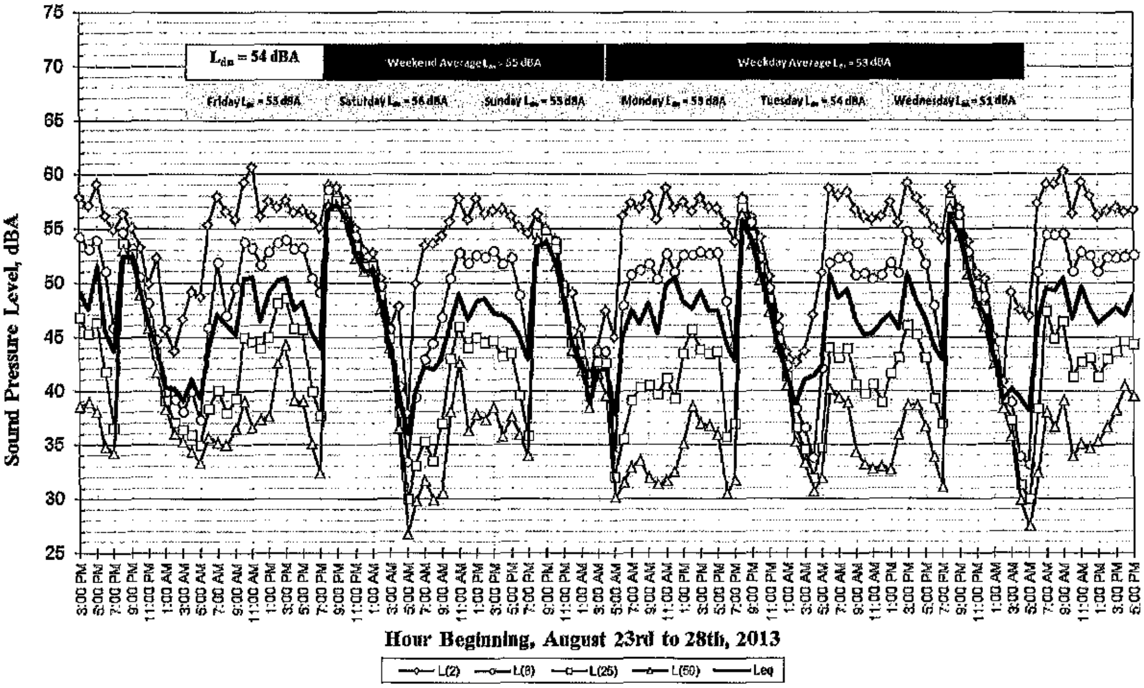


Figure 3. Measured Noise Levels at LT-2

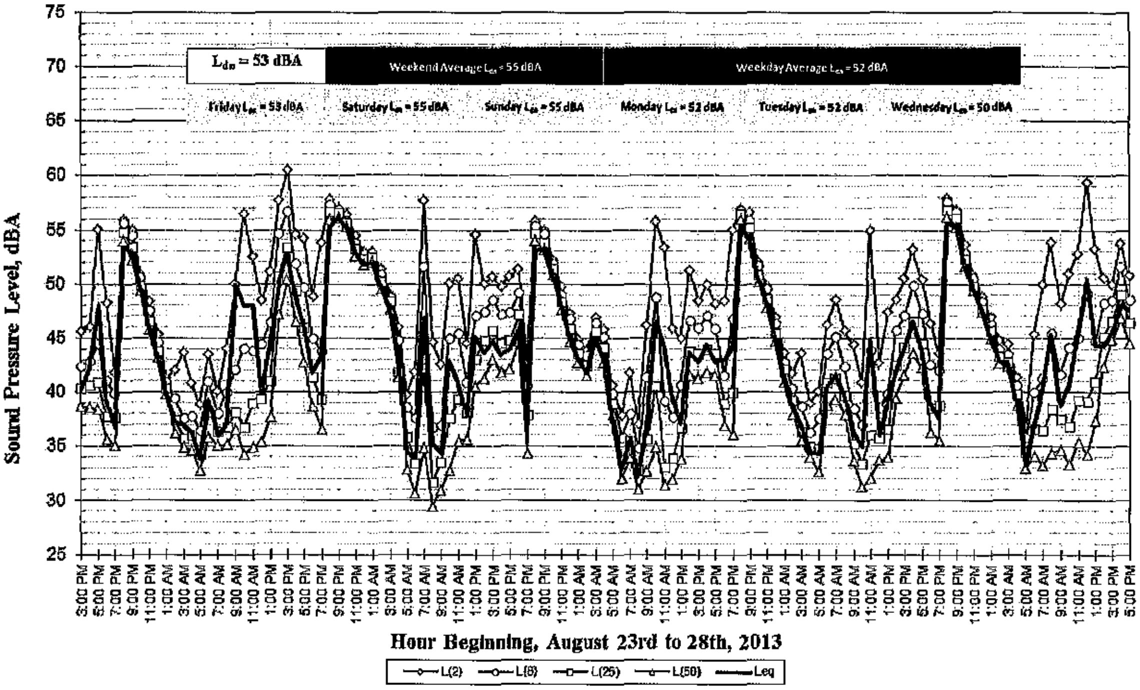

From Figure 2, the daytime L_{eq} for the weekend (i.e., Saturday and Sunday) at LT-1 ranged from 42 to 57 dBA, with an average L_{eq} of 50 dBA. The nighttime L_{eq} for the weekend at LT-1 ranged from 36 to 56 dBA, with an average L_{eq} of 49 dBA. During the weekdays (i.e., Friday, Monday, Tuesday, and Wednesday), the average daytime and nighttime averages for L_{eq} ranged from 43 to 56 dBA, with an average of 50 dBA, and from 38 to 51 dBA, with an average of 46 dBA, respectively. The day-night average noise level, which is the L_{dn}, at LT-1 measured to be 55 dBA on the weekend and 53 dBA on the weekday. The overall L_{dn} for the entire testing period was 54 dBA. The chart in Figure 2 shows the average L_{dn} for each day of testing. The daytime and nighttime noise descriptors used to interpret the County's Noise Performance Standards at LT-1 for the measurement period are shown in Table 2.

For LT-2, which is shown in Figure 3, the average L_{eq} measurements from the weekend ranged from 34 to 56 dBA in the daytime, with an average of 49 dBA, and from 34 to 55 dBA in the nighttime, with an average of 48 dBA. On the weekdays, the average L_{eq} in the daytime ranged from 32 to 56 dBA, with an average of 48 dBA. In the nighttime, the average weekday L_{eq} ranged from 33 to 52 dBA, with an average of 45 dBA. The average weekend L_{dn} was 55 dBA, and on the weekday, the L_{dn} was approximately 52 dBA. The overall L_{dn} for the entire testing period at LT-2 was 53 dBA. The calculated L_{dn} for each day of testing is shown in Figure 3. The Noise Performance Standards at LT-2 are summarized in Table 2.

In comparing the hourly noise levels for each long-term measurement location, notice that the median noise levels, L_{50}, during the nighttime hours of 10:00 p.m. to 7:00 a.m. drop well-below 30 dBA on two different occasions near the roadway at LT-1 but barely drop as low as 30 dBA at LT-2 during the same period of time. This higher nighttime ambient noise further from the roadway is likely due to nighttime woodland insect noise.

Based on the results from LT-1 and LT-2, the L_{dn} levels measured on the weekend were approximately 2 to 3 dBA higher than on the weekdays. The weekend L_{eq} levels in the daytime were approximately 0 to 1 dBA higher than the weekdays, and in the nighttime, the weekend L_{eq} levels averaged to be approximately 3 dBA higher than on the weekdays. Since winery-related noise generally occurs at the same or higher rates on the weekends, ambient noise from the weekends will be used to conduct the impact assessment for the worst-case scenario.

Table 2: Measured Ambient Noise Levels

Hourly Noise Metric	**Exterior Ambient Noise Levels**			
	LT-1 (southern property line near Westside Road Noise)		**LT-2 (eastern property line away from Westside Road Noise)**	
	Avg. Daytime Level (Range)	**Avg. Nighttime Level** (Range)	**Avg. Daytime Level** (Range)	**Avg. Nighttime Level** (Range)
L_{50} (30 Min.)	**48** (34 to 58)	**47** (30 to 57)	**48** (32 to 57)	**47** (34 to 56)
L_{25} (15 Min.)	**52** (41 to 58)	**48** (33 to 57)	**49** (35 to 58)	**48** (36 to 56)
L_{08} (5 Min.)	**53** (43 to 59)	**48** (33 to 57)	**50** (35 to 58)	**48** (36 to 56)
L_{02} (1 Min.)	**57** (53 to 61)	**51** (38 to 59)	**53** (37 to 61)	**49** (37 to 56)

NOISE ASSESSMENT

Estimating the expected noise produced by, and impacts from, the proposed project at adjacent noise-sensitive uses requires three elements: 1) identification of what noise-producing operations are likely to occur; 2) the typical noise source levels for those operations; and 3) the temporal nature of the operations.

I. Identification of Noise-Producing Operations/Uses

There are a number of operations associated with wine production and events at the proposed facility that will produce noise. These include:

1. Project traffic;
2. Winery and seasonal production operations;
3. Maintenance and forklift operations; and
4. Special event noise.

II. Typical Noise Source Levels

To estimate the noise levels associated with project operations, some attention must be given to the temporal nature of the noise produced. Below each of the major winery-related noise-producing operations outlined above are discussed:

1. *Project Traffic* would produce the following type and range of traffic noise levels:
    a. Automobile and light-vehicle traffic accessing the tasting room would occur during the daytime hours, and noise produced is expected to include the sounds of vehicles accessing parking areas, engine starts, door slams, etc. These noises typically range from a maximum of 53 to 63 dBA at 50 feet (15 meters).
    b. The majority of truck traffic on the project site is expected to primarily access the winery building on the western side of Westside Road, though some truck traffic may also access other portions of the site. Noise levels generated by truck traffic are dependent on the size and speed of trucks; typically, maximum noise levels generated

by heavy-duty (i.e., semi-tractor trailer type) trucks would range from 70 dBA when traveling at constant speeds to 75 dBA when stopping/starting and maneuvering at a distance of 50 feet (15 meters). Medium (box type and delivery) trucks would typically have maximum levels ranging from 60 dBA when traveling at constant speeds to 65 dBA when stopping/starting and maneuvering at a distance of 50 feet.

2. *Winery and Seasonal Production Operations* would produce the following type and range of noise levels:
   a. Refrigeration equipment, as a maximum condition, is assumed to operate under constant conditions during the day and night. Though the model, type, and capacities of the cooling compressors for the facility are not specified, field measurements of such equipment show that sound levels from such equipment can produce levels between 50 and 65 dBA at 50 feet, with L_{50} noise levels of 60 dBA at 50 feet.
   b. Air compressors used for various processes in the facility typically cycle on and off based on the need for compressed air. Though the model, type, and capacities of the cooling compressors for the facility are not specified, we can estimate results based on field measurements of cooling compressors at other wineries. The equipment is expected to produce L_{50} sound levels of 62 dBA at 50 feet.
   c. Bottling would be constant on an hourly basis, although it is likely to occur for only a few weeks each year. Based on sound level measurements of bottling lines at other wineries, bottling operations can be expected to produce L_{50} sound levels between 65 and 70 dBA at 50 feet.
   d. Crush activities at medium to large-sized wineries typically occur for approximately two months each year. The majority of the noise sources associated with the crush include the operation of hoppers, presses, de-stemmers, separators, crushers, air compressors, forklifts, conveyors, etc. Average noise levels resulting from the crush are typically constant on an hourly basis. Individual pieces of crush-specific equipment, such as the separators and de-stemmers, are relatively quiet with sound levels around 50 dBA L_{eq} at approximately 50 feet. The composite crush activities at a large sized winery, such as a 60,000-case capacity facility, typically generate noise levels of approximately 66 dBA L_{eq} at a distance of 50 feet from the center of operations. During the crush, discrete maximum noise events, such as the setting of empty bins, may reach 70 to 80 dBA L_{max} or L_{02} at 50 feet from the center of operations.
3. *Maintenance and Forklift Operations* would produce intermittent noise depending upon the exact nature of the operation. These would likely occur at a much slower than a daily rate; although operations may span several hours, once initiated. Backup alarms (or beepers), which are repetitive and irritating by design, would also produce noise during these activities, and as with forklift operations, are expected to be intermittent by nature. Forklift use and associated backup alarm noise would be partially attenuated during crush-related activities by structure of the production building. Based on experience with other winery operations, it can be estimated that non-attenuated L_{08} noise levels from these operations may reach levels of 66 to 67 dBA at 50 feet.
4. *Special Events Noise*, such as concerts and weddings are not planned, nor requested, at the winery. The winery does plan to participate in industry-related events, averaging approximately 24 per year. Based on review of site plans, indoor events would be held in the building connected to the tasting room by a constructed bridge or within the walnut grove at the east boundary of the site. The events building will be located across the street from the production facilities. Table 3 summarizes typical noise levels generated by small-to-moderate sized events at distances of 50 feet from the source.

Table 3: Typical Noise Source Levels for Promotional Events (A-Weighted L_{50} Levels)

Event or Activity	Typical Noise Level @ 50 ft
Amplified Music[1]	72 dBA
Amplified Speech	71 dBA
Non-amplified (acoustic) Music	67 dBA
Films – Voices/Music	64 dBA
Raised Conversation	65 dBA

[2] Amplified concert-type music events are not proposed – such events would increase L_{50} noise levels to 80 dBA at 50 feet.

III. Propagation of sound

The final step in estimating the project noise levels is assessing the propagation of sound to the sensitive receptors. To do this, it is necessary to assume some rate of sound attenuation between the operations and receiver locations. The most dominant physical effect is due to the spreading out of sound waves with distance. For simple, single sources, such as fixed equipment and stationary truck operations, the divergence of the sound wave is hemispherical in nature, producing a reduction of 6 dB with each doubling of distance. For moving sources of noise, such as automobile traffic or truck movements, which are considered linear sources of noise, the divergence of the sound wave is cylindrical in nature, producing a reduction of 3 to 4 ½ dB with each doubling of distance. Other effects can modify these fall-off rates, such as partial shielding from buildings or topography, atmospheric attenuation of sound, ground absorption, and meteorological effects. These effects almost always reduce the noise, in addition to that due to sound divergence. As most of these effects will vary with time due to changing environmental conditions, it is most conservative to assume only attenuation due to divergence for outdoor activities and conservative (minimal) rate of structural attenuation (12 dBA) when operations are conducted within buildings, realizing that the actual noise level will be at or, most likely, below those predicted using this assumption at any one time.

To evaluate noise impacts on area noise sensitive uses, noise levels were propagated to three representative residences. There is also an existing farmhouse on the project site to the west of Westside Road. This residence is to be demolished, and therefore, does not require noise propagation calculations. Noise propagation calculations were completed on the following residences (see Figure 1 for locations):

1. *Residence 1*: This residence is located in the vicinity of LT-1. It is south of the project site on the same side of Westside Road as the tasting room and event barn and therefore on the opposite side as the wine production building. The residence is approximately 75 feet (23 meters) from the centerline of Westside Road. The front yard of this home is represented by the calculated noise levels for monitoring position LT-1.
2. *Residence 2*: This residence is also located to the south of the project site. Residence 2 is also south of Residence 1 and slightly west. Since Westside Road turns westward just south of Residence 1, the alignment of Residence 2 is such that it is located directly south of the wine production building. This property includes an outdoor pool area that is approximately 100 to 170 feet (30 to 52 meters) from the centerline of Westside Road. The front yard of the home ranges from 52 to 180 feet (16 to 55 meters) from the centerline of the roadway, and the front façade of the home is 190 to 215 feet (58 to 66 meters) from the roadway centerline. Due to the proximity of the home to LT-1, the calculated noise levels at this monitoring location are represented by LT-1 minus 3 dBA.
3. *Residence 3*: While on the same side of Westside Road as Residences 1 and 2, the geometry of the roadway is such that Residence 3 is southwest of the wine production building.

Positioned approximately 50 to 75 feet (15 to 23 meters) from the centerline of Westside Road, this home is also best represented by LT-1 plus 3 dBA.

Ambient noise levels at these residences under worst case (i.e., weekend) conditions were calculated using the sound level differences noted above and the measurement results shown in Table 2 for the long-term noise measurement, LT-1. Table 4 summarizes the calculated levels for all four residences.

Table 4. Calculated Ambient Noise Levels at Adjacent Noise-Sensitive Uses

Hourly Noise Metric	Exterior Ambient Noise Levels, dBA					
	Residence 1		Residence 2		Residence 3	
	Avg. Daytime Level	Avg. Nighttime Level	Avg. Daytime Level	Avg. Nighttime Level	Avg. Daytime Level	Avg. Nighttime Level
L_{50} (30 min.)	48	47	45	44	51	50
L_{25} (15 min.)	52	48	49	45	55	51
L_{08} (5 min.)	53	48	50	45	56	51
L_{02} (1 min.)	57	51	54	48	60	54

IMPACT ASSESSMENT

Impact 1: Traffic, Parking Lot and Truck Noise

Automobile parking and traffic

On the east side Westside Road where the tasting room and office and industry accommodations are located, the existing driveways and parking areas will be used. The parking lot will be enhanced, but the general location will remain the same. Residence 1 (represented by LT-1 at the southern boundary of the winery property) is approximately 960 feet from the nearest parking area; Residences 2 (located further south of LT-1 along Westside Road) and 3 (located to the west of LT-1, also along Westside Road) are approximately 1,220 and 1,210 feet, respectively, from the nearest parking area. Based on these distances, noise generated by automobile and light vehicles would be between 28 and 38 dBA at Residence 1 and between 25 and 35 dBA at both Residences 2 and 3. Given the expected visitor and employee use, these activities are expected to occur for less than five minutes out of an hour on a typical day and fall in the L_{02} NE-2 daytime category of 65 dBA (see Table 1). However, during events or on busy weekends, such activities may occur more frequently and fall in the L_{08} NE-2 daytime category of 60 dBA. The ambient noise environment in this area is described by measurements at site LT-1. Table 5 summarizes the assessment of automobile noise in driveways and in parking lots.

Based on this finding, noise levels associated with automobiles and light vehicles using the project driveways and parking lots would not exceed the daytime NE-2 noise standards at the nearest residences.

Table 5. Driveway and Parking Lot Automobile L_{08} Noise Levels

NE-2 Adjustment	+0	+0	+0
Adjusted Table NE-2 Daytime Limit	60	60	60
Driveway/Parking Noise Exceeds NE-2?	No	No	No

Truck traffic

Trucks visiting the winery site will use the new driveway to access the wine production facility on the west side of the roadway. This main winery access path will take constant speed and maneuvering trucks within respective distances of approximately 1,170 to 1,335 feet of Residence 1, 1,290 to 1,595 feet of Residence 2, and 1,200 to 1,515 feet of Residence 3. Using these distances, noise generated by heavy-duty trucks may range from 48 to 56 dBA at Residence 1 and from 47 to 55 dBA at both Residences 2 and 3. The noise generated by medium-duty trucks ranged from 38 to 46 dBA at Residence 1 and from 37 to 45 dBA at Residences 2 and 3. Truck operations are expected to occur during daytime hours only and on a basis of one to five minutes per hour, or less, since it is unlikely that more than one heavy truck would arrive and depart during any given hour. Thus, truck operations would fall in the L_{02} NE-2 category of 65 dBA (see Table 1) at the adjacent residential uses. Table 6, below, presents and summarizes the assessment of truck traffic noise.

Based on these findings, noise associated with truck traffic at the project is not expected to exceed daytime NE-2 noise standards at the nearest residences.

Table 6. Truck L_{02} Noise Levels

Mitigation 1: None Needed

Impact 2: Mechanical Equipment Noise

The project would likely include noise-generating mechanical equipment, such as air-cooled condensing units, pumps, and compressors, at the wine production facility, as well as less-significant sources of noise, such as air-conditioning systems and exhaust fans. The project description and drawings do not indicate the location of such equipment. This equipment may be located within the structures or positioned so that the structures provide shielding for noise caused by the equipment. However, considering a worst case scenario where the equipment is placed outside of production buildings and not shielded from the adjacent residences, the equipment may be located as close as 1,210 feet from Residence 1, as 1,300 feet from Residence 2, and as close as 1,170 feet from Residence 3.

Using the source levels discussed above and a 6 dB sound reduction for each doubling of the distance between the noise source and the receivers, constant L_{50} noise levels from mechanical equipment may be between an L_{50} of 32 and 34 dBA at Residences 1 and 2 and between an L_{50} of 33 and 35 dBA at Residence 3. Table 7, below, summarizes the assessment of mechanical equipment noise.

Table 7. Mechanical Equipment L_{50} Noise Levels

	L_{50} (Noise Level Exceeded 30 minutes in Any Hour), dBA		
	Residence 1	**Residence 2**	**Residence 3**

Adjusted Table NE-2 Nighttime Limit	47	45	50
Mechanical Equipment Noise Exceeds NE-2?	No (day & night)	No (day & night)	No (day & night)

Based on these findings, noise associated with mechanical equipment is not expected to exceed daytime or nighttime NE-2 noise standard at the nearest residences.

Mitigation 2: None Needed

Impact 3: Crush-Related Noise

Annual crush-related activities would take place within the new wine production building. The crush pad & press equipment room will be located on the first floor and on the western side of the building, which indicates considerable shielding of crush-related noise by the building itself from the nearby residences. Based on the Winery Floor Plans provided, the space above the crush pad will be open to the second floor, but it is unclear if the area will be open or closed to nature. Assuming the worst case scenario, crush-related activities will be considered to occur outdoors. From the plans for the project site and the building plans, the future location of the crush pad was estimated, and using Google Earth, the distances to the each residence was approximated. The crush pad will be within 1,280 feet of Residence 1, within 1,400 feet of Residence 2 and within 1,275 feet of Residence 3. Using the source levels discussed above and a 6 dB sound reduction for each doubling of the distance, constant L_{50} noise levels from crush-related activities would be approximately 38 dBA at Residence 1, 37 dBA at Residence 2, and 38 dBA at Residence 3. Table 8, below, summarizes these calculations. The maximum noise events discussed above, such as bin drops, etc., would be an L_{02} of 42 to 52 dBA at Residence 1, 41 to

51 dBA at Residence 2, and 42 to 52 dBA at Residence 3. Table 9 summarizes the maximum noise events assessment of crush-related activities.

Based on the findings shown, noise associated with crush related noise is not expected to exceed daytime or nighttime NE-2 noise standard at the nearest residences.

Mitigation 3: None Needed

Impact 4: Bottling Noise

According to the building floor plans provided, bottling will be done in the production facility area, next to the truck access loading zone. The building will provide shielding from noise created during bottling activities. The distances from the bottling area to the nearby residences are as follows: 1,225 feet from Residence 1, 1,345 feet from Residence 2, and 1,200 feet from Residence 3. Based on these distances and the noise shielding, noise from bottling activities are expected to be an L_{50} of 37 to 42 dBA at Residence 1, an L_{50} of 36 to 41 dBA at Residence 2, and an L_{50} of 37 to 42 dBA at Residence 3. Table 10 summarizes the assessment of bottling noise.

Nighttime NE-2 Adjustment	+2	+0	+5
Bottling Noise at Receiver	**37 to 42**	**36 to 41**	**37 to 42**
Operations Exceed Ambient by 10 dBA?	No (day & night)	No (day & night)	No (day & night)
NE-2 Adjustment	+0 (day & night)	+0 (day & night)	+0 (day & night)
Adjusted Table NE-2 Daytime Limit	50	50	51
Adjusted Table NE-2 Nighttime Limit	47	45	50
Bottling Noise Exceeds NE-2?	No (day & night)	No (day & night)	No (day & night)

Based on these findings, noise associated with bottling is not expected to exceed daytime or nighttime NE-2 noise standard at any of the adjacent residences.

Mitigation 4: None Needed

Impact 5: Maintenance and Forklift Operations

Forklift and maintenance operations would likely take place on the first floor inside the new winery building, in the outdoor crushing and receiving areas, and possibly in the winery caves. Such activities within the winery building would receive significant noise shielding from the building and are not analyzed here. The crushing area would also receive considerable shielding from the building. Outdoor forklift and maintenance operations are considered a worst-case condition and are analyzed. Based on a review of project drawings, the outdoor area closest to the adjacent residences would be the receiving area/truck access, which was mentioned above as being within 1,335 feet of Residence 1, within 1,595 feet of Residence 2, and within 1,515 feet of Residence 3. Using the source levels discussed above and a 6 dB sound reduction for each doubling of the distance between the noise source and the receivers, noise from forklift and maintenance operations activities are expected to be an L_{08} of between 37 and 38 dBA at Residence 1 and an L_{08} of between 36 and 37 dBA at Residences 2 and 3. Table 11, following, summarizes the assessment of noise due to forklift and maintenance operations. Note, forklift and maintenance operations will only occur during the daytime hours.

Table 11. Forklift and Maintenance L_{08} Noise Levels

	L_{08} (Noise Level Exceeded 5 minutes in Any Hour), dBA		
	Residence 1	**Residence 2**	**Residence 3**
Unadjusted Table NE-2 Daytime Limit	60	60	60
Daytime Ambient Noise Levels	53	50	56
Ambient Exceeds NE-2 Limit?	No	No	No
NE-2 Adjustment	+0	+0	+0
Forklift/Maintenance Operations at Receiver	**37 to 38**	**36 to 37**	**36 to 37**
Operations Exceed Ambient by 10 dBA?	No	No	No
NE-2 Adjustment	+0	+0	+0
Adjusted Table NE-2 Daytime Limit	60	60	60
Forklift/Maintenance Operations Noise Exceed NE-2?	No	No	No

Based on these findings, noise associated with forklift and maintenance operations is not expected to exceed daytime NE-2 noise standard at the nearest residences.

Mitigation 5: None Needed

Impact 6: Event Noise at adjacent residential uses
Special events, such as concerts and weddings, are not planned, nor requested at the winery; however, the winery does plan to participate in county-wide industry events. The project application includes provisions for 24 special events per year, including 10 events with 30 persons in attendance, five 60-person catered events, participation in five 120-person industry-wide events, and four 300-person outdoor events. For an event consisting of 300 persons, a staff of approximately 14 people is expected.

A review of the project site plans indicates that outdoor events may be held either on the east side of Westside Road in the vicinity of the tasting room and barn or in the picnic grove area located along the eastern boundary of the property near LT-2. Indoor events would be held inside the tasting room or barn. The production facility on the west side of the roadway will only be opened to guests by invitation only. Events occurring within the winery buildings would receive noise shielding from the building structures estimated at 12 dBA (assuming open windows and/or doors). However, the outdoor events held in the garden area or yard between the tasting room/barn and Westside Road, in the yard south of the barn, in the yard east of the barn, or in the picnic grove area would receive little to no noise attenuation from intervening terrain or building structures at Residences 1, 2, and 3. The outdoor area between the tasting room and the barn would have some shielding from the barn structure.

Based on a review of aerial photos and the project site plan, distance information obtained using Google Earth indicates that outdoor events that take place around the tasting room and events barn could be situated as close as 690 feet from Residence 1, 900 feet from Residence 2, and 915 feet from Residence 3. The outdoor events taking place in the picnic grove area would be approximately 1,525 feet from Residence 1, 1,775 feet from Residence 2, and 1,900 feet from Residence 3. The event space and guest rooms located in the barn are the closest indoor rooms for events. From the maps, indoor events at these locations would be as close as 885 feet from Residence 1, 1,100 feet from Residence 2, and 1,110 feet from Residence 3. Using these distances and the noise shielding considerations for outdoor and indoor events, the L_{50} sound levels for the typical noise source levels listed in Table 3 for outdoor and indoor events have been calculated at Residences 1, 2, and 3. Tables 12 and 13 summarize the assessments for outdoor special events noise around the winery and in the picnic grove area, respectively. Table 14 summarizes the assessment for the indoor special events noise.

Table 12. Outdoor Special Events L_{50} Noise Levels in the Vicinity of the Winery

NE-2 Limits, Ambient Noise Levels, and Adjustments	**L_{50} (Noise Level Exceeded 30 minutes in Any Hour), dBA**		
	Residence 1	**Residence 2**	**Residence 3**
Unadjusted Table NE-2 Daytime Limit	50	50	50

Raised Conversation Exceeds Adjusted NE-2?	No (day & night)	No (day & night)	No (day & night)

Based on the findings shown in Table 12, all daytime and nighttime outdoor events would exceed County NE-2 standards at Residences 1, 2, and 3 in the amplified music and speech categories, except amplified speech during daytime hours at Residence 3. Additionally, non-amplified music NE-2 standards would also be exceeded at nighttime at Residences 1 and 2.

Table 13. Outdoor Special Events L_{50} Noise Levels in the Picnic Grove Area

Based on the findings shown in Table 13, the only County NE-2 standard that would be exceeded during an outdoor event in the picnic grove area, as measured at Residence 2, would be amplified music in the nighttime. And note that this only standard would be exceeded by only one dBA. There are no calculations shown in Table 13 during the daytime hours that would exceed the County NE-2 standards at any residence.

Table 14. Indoor Special Events L_{50} Noise Levels

Raised Conversation Exceeds Adjusted NE-2?	No (day & night)	No (day & night)	No (day & night)

Based on the findings shown in Table 14, daytime or nighttime indoor events with amplified music, amplified speech, non-amplified music, films, or raised conversations would not exceed the County NE-2 standards at any of the three adjacent residences.

Mitigation 6: Special/Promotional Events

The findings above show that during outdoor events taking place near the winery buildings, amplified music and speech exceed the County NE-2 standards at Residences 1 and 2, during the daytime and nighttime. At Residence 3, the amplified music standard would be exceeded during the daytime and nighttime, as well as the amplified speech standard in the nighttime. Additionally, the non-amplified music standard would also be exceeded in the nighttime hours at Residences 1 and 2. In the picnic grove area, however, the only County NE-2 standard that would be exceeded is amplified music at nighttime. This would occur only at Residence 2. Since even noise has the potential to result in levels exceeding the standard fairly significantly, the following measures should be included in the project:

1. Amplified music and speech at events should only occur during daytime hours within the events barn or tasting room buildings or in the picnic grove.
2. Outdoor events in the vicinity of the winery with non-amplified outdoor music and/or speech may occur outdoors only during daytime hours (7:00 a.m. to 10:00 p.m.).
3. Any outdoor event occurring beyond 10:00 p.m. should be moved indoors.

4. A noise management plan should be developed for daytime outdoor events with amplified music to allow for these events to be held in accordance with provision 4 of NE-1c of the Sonoma County Noise Element. Through this provision, allowable noise exposures can increase by 5 dB. As such, up to six daytime events with amplified music would be allowed, as predicted noise levels would fall at or below the short-term noise source limit.

APPENDIX A:
FUNDAMENTAL CONCEPTS OF ENVIRONMENTAL ACOUSTICS

Noise may be defined as unwanted sound. Noise is usually objectionable because it is disturbing or annoying. The objectionable nature of sound may be caused by either its *pitch* or its loudness. *Pitch* is the height or depth of a tone or sound, depending on the relative rapidity (frequency) of the vibrations by which it is produced. Higher pitched signals sound louder to humans than sounds with a lower pitch. *Loudness* is intensity of sound waves combined with the reception characteristics of the ear. Intensity may be compared with the height of an ocean wave in that it is a measure of the amplitude of the sound wave.

In addition to the concepts of pitch and loudness, there are several noise measurement scales that are used to describe noise in a particular location. *A decibel (dB)* is a unit of measurement that indicates the relative amplitude of a sound. The zero on the decibel scale is based on the lowest sound level that the healthy, unimpaired human ear can detect. Sound levels in decibels are calculated on a logarithmic basis. An increase of 10 decibels represents a ten-fold increase in acoustic energy, while 20 decibels is 100 times more intense, 30 decibels is 1,000 times more intense, etc. There is a relationship between the subjective noisiness or loudness of a sound and its intensity. Each 10-decibel increase in sound level is perceived as approximately a doubling of loudness over a fairly wide range of intensities. Technical terms are defined in Table 1. There are several methods of characterizing sound. The most common in California is the *A-weighted sound level or dBA.* This scale gives greater weight to the frequencies of sound to which the human ear is most sensitive. Representative outdoor and indoor noise levels in units of dBA are shown in Table 2.

Because sound levels can vary markedly over a short period of time, a method for describing either the average character of the sound or the statistical behavior of the variations must be utilized. Most commonly, environmental sounds are described in terms of an average level that has the same acoustical energy as the summation of all the time-varying events. This energy-equivalent sound/noise descriptor is called L_{eq}. The most common averaging period is hourly, but L_{eq} can describe any series of noise events of arbitrary duration.

The scientific instrument used to measure noise is the sound level meter. Sound level meters can accurately measure environmental noise levels to within about plus or minus 1 dBA. Various computer models are used to predict environmental noise levels from sources, such as roadways and airports. The accuracy of the predicted models depends upon the distance the receptor is from the noise source. Close to the noise source, the models are accurate to within about plus or minus 1 to 2 dBA.

TERM	DEFINITIONS
Decibel, dB	A unit describing the amplitude of sound, equal to 20 times the logarithm to the base 10 of the ratio of the pressure of the sound measured to the reference pressure, which is 20 micropascals (20 micronewtons per square meter).
Frequency, Hz	The number of complete pressure fluctuations per second above and below atmospheric pressure.
A-Weighted Sound Level, dBA	The sound pressure level in decibels as measured on a sound level meter using the A-weighting filter network. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear and correlates well with subjective reactions to noise. All sound levels in this report are A-weighted, unless reported otherwise.
L_{01}, L_{10}, L_{50}, L_{90}	The A-weighted noise levels that are exceeded 1%, 10%, 50%, and 90% of the time during the measurement period.
Equivalent Noise Level, L_{eq}	The average A-weighted noise level during the measurement period.
Day/Night Noise Level, L_{dn}	The average A-weighted noise level during a 24-hour day, obtained after addition of 10 decibels to levels measured in the night between 10:00 pm and 7:00 am.
L_{max}, L_{min}	The maximum and minimum A-weighted noise level during the measurement period.
Ambient Noise Level	The composite of noise from all sources near and far. The normal or existing level of environmental noise at a given location.
Intrusive	That noise which intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of a sound depends upon its amplitude, duration, frequency, and time of occurrence and tonal or informational content as well as the prevailing ambient noise level.

Definitions Of Acoustical Terms **Table 1**

ILLINGWORTH & RODKIN, INC.*/Acoustical Engineers*

Since the sensitivity to noise increases during the evening and at night -- because excessive noise interferes with the ability to sleep -- 24-hour descriptors have been developed that incorporate artificial noise penalties added to quiet-time noise events. The *Day/Night Average Sound Level, Ldn,* is a measure of the cumulative noise exposure in a community, with a 10 dB penalty added to nighttime (10:00 pm - 7:00 am) noise levels.

At a Given Distance From Noise Source	A-Weighted Sound Level in Decibels	Noise Environments	Subjective Impression
	140		
Civil Defense Siren (100')	130		
Jet Takeoff (200')	120		Pain Threshold
	110	Rock Music Concert	
Diesel Pile Driver (100')	100		Very Loud
	90	Boiler Room	
Freight Cars (50')		Printing Press Plant	
Pneumatic Drill (50')	80		
Freeway (100')			
Vacuum Cleaner (10')	70	In Kitchen With Garbage Disposal Running	Moderately Loud
	60	Data Processing Center	
Light Traffic (100')	50	Department Store	
Large Transformer (200')			
	40	Private Business Office	Quiet
Soft Whisper (5')	30	Quiet Bedroom	
	20	Recording Studio	
	10		Threshold of Hearing
	0		

Typical Sound Levels Measured In The Environment And Industry **Table 2**

ILLINGWORTH & RODKIN, INC./Acoustical Engineers

Effects of Noise

Sleep and Speech Interference: The thresholds for speech interference indoors are about 45 dBA if the noise is steady and above 55 dBA if the noise is fluctuating. Outdoors the thresholds are about 15 dBA higher. Steady noise of sufficient intensity; above 35 dBA, and fluctuating noise levels above about 45 dBA have been shown to affect sleep. Interior residential standards for multi-family dwellings are set by the State of California at 45 dBA L_{dn}. Typically, the highest steady traffic noise level during the daytime is

about equal to the L_{dn} and nighttime levels are 10 dBA lower. The standard is designed for sleep and speech protection and most jurisdictions apply the same criterion for all residential uses. Typical structural attenuation is 12-17 dBA with open windows. With closed windows in good condition, the noise attenuation factor is around 20 dBA for an older structure and 25 dBA for a newer dwelling. Sleep and speech interference is therefore possible when exterior noise levels are about 57-62 dBA L_{dn} with open windows and 65-70 dBA L_{dn} if the windows are closed. Levels of 55-60 dBA are common along collector streets and secondary arterials, while 65-70 dBA is a typical value for a primary/major arterial. Levels of 75-80 dBA are normal noise levels at the first row of development outside a freeway right-of-way. In order to achieve an acceptable interior noise environment, bedrooms facing secondary roadways need to be able to have their windows closed, those facing major roadways and freeways typically need special glass windows.

Annoyance: Attitude surveys are used for measuring the annoyance felt in a community for noises intruding into homes or affecting outdoor activity areas. In these surveys, it was determined that the causes for annoyance include interference with speech, radio and television, house vibrations, and interference with sleep and rest. The L_{dn} as a measure of noise has been found to provide a valid correlation of noise level and the percentage of people annoyed. People have been asked to judge the annoyance caused by aircraft noise and ground transportation noise. There continues to be disagreement about the relative annoyance of these different sources. When measuring the percentage of the population highly annoyed, the threshold for ground vehicle noise is about 55 dBA L_{dn}. At an L_{dn} of about 60 dBA, approximately 2 percent of the population is highly annoyed. When the L_{dn} increases to 70 dBA, the percentage of the population highly annoyed increases to about 12 percent of the population. There is, therefore, an increase of about 1 percent per dBA between an L_{dn} of 60-70 dBA. Between an L_{dn} of 70-80 dBA, each decibel increase increases by about 2 percent the percentage of the population highly annoyed. People appear to respond more adversely to aircraft noise. When the L_{dn} is 60 dBA, approximately 10 percent of the population is believed to be highly annoyed. Each decibel increase to 70 dBA adds about 2 percentage points to the number of people highly annoyed. Above 70 dBA, each decibel increase results in about a 3 percent increase in the percentage of the population highly annoyed.

Subject: **Ramey Winery Project, Sonoma County, CA**
Environmental Noise Assessment Addendum

Dear Ms. Ver Meer:

The nearest residence to the proposed Ramey Winery Project site is adjacent to the proposed project site along the southern boundary. The shared property line would be approximately 1,340 feet from the Walnut Grove picnic grounds located along the eastern boundary of the project site. At the picnic grounds, outdoor special events are expected to take place. Based on the noise levels for typical noise sources that would occur during promotional events, noise levels at the shared property line of the nearest residence was calculated. Table 1 summarizes the results at this distance.

Outdoor amplified music at the Walnut Grove picnic area would exceed the County NE-2 standard at the property line of the nearest residence during nighttime hours by 1 dBA. There are no special events activities that would cause noise levels in excess of the standard during daytime hours at this location.

Mitigation: Special/Promotional Events

In addition to the impacts expressed in the original noise report, dated October 2, 2014, for special/promotional events, outdoor amplified music at the Walnut Grove picnic area would exceed the County NE-2 standard during nighttime hours at the property line of the nearest residence located to the south of the project site. The following mitigation measures were proposed in the original noise report and would also suffice for the impact at the shared property line:

1. Amplified music and speech at events should only occur during daytime hours within the baling barn or tasting room buildings, assuming the windows and doors are open, or in the picnic grove. ?

2. Outdoor events in the vicinity of the winery with non-amplified outdoor music and/or speech may occur outdoors only during daytime hours (7:00 a.m. to 10:00 p.m.).

3. Any outdoor event occurring beyond 10:00 p.m. should be moved indoors. ? NO

4. A noise management plan should be developed for daytime outdoor events with amplified music to allow for these events to be held in accordance with provision 4 of NE-1c of the Sonoma County Noise Element. Through this provision, allowable noise exposures can increase by 5 dB. As such, up to six daytime events with amplified music would be allowed, as predicted noise levels would fall at or below the short-term noise source limit.

With the implementation of these mitigation measures, noise levels would be maintained at or below the County NE-2 standard.

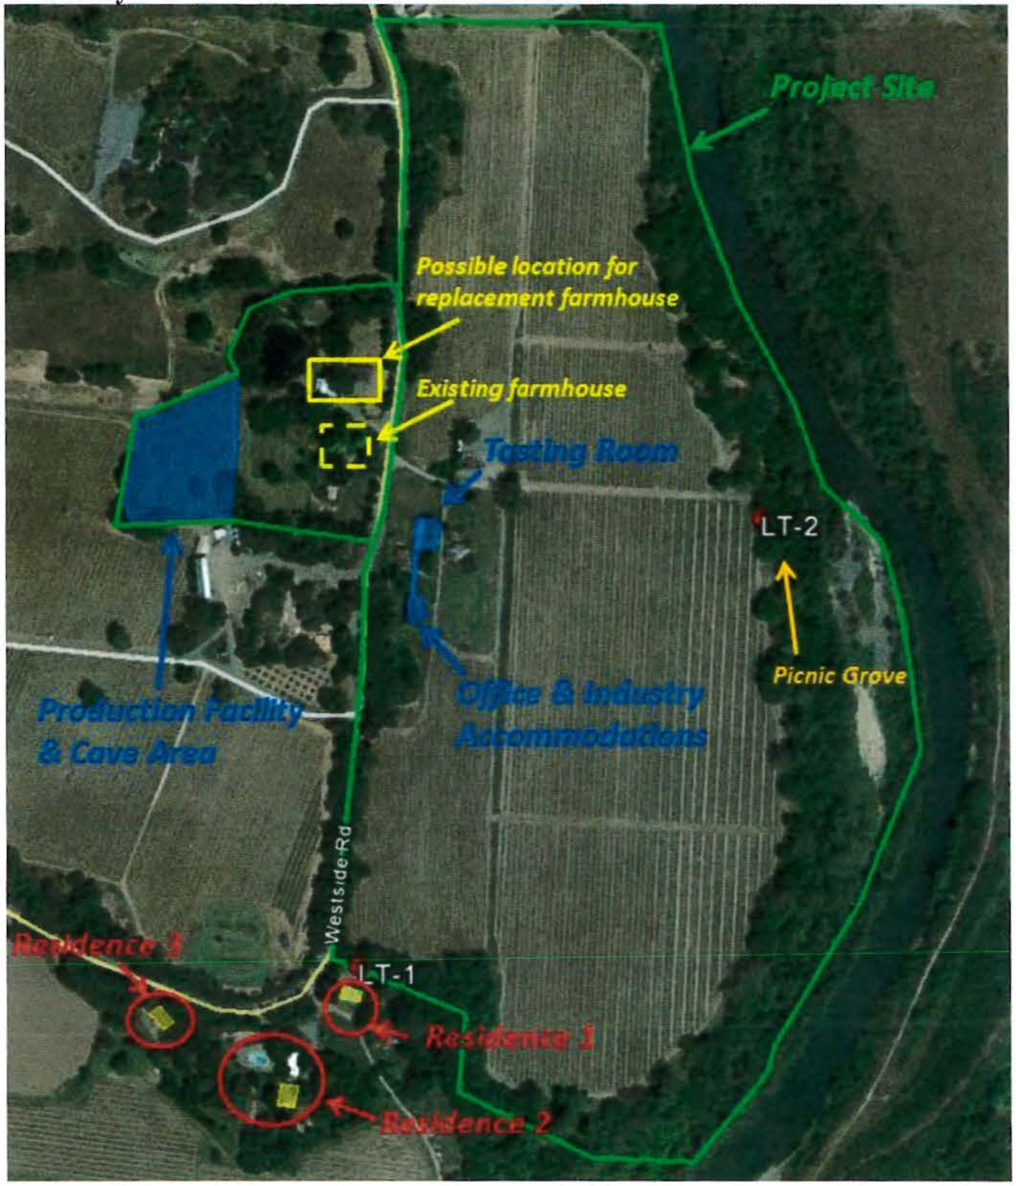
INTRODUCTION

This noise assessment evaluates the existing noise environment and the potential for increased noise as a result of the proposed Ramey Wine Cellars Project (Project) on a parcel located at 7097 Westside Road near the City of Healdsburg in an unincorporated area of Sonoma County. Figure 1 shows a site map of the property. The proposed project includes production of 60,000 cases of wine, a tasting room, retail sales, and an area designated for trade-related special events. On the eastern side of Westside Road, the existing hop kiln will be converted into a public tasting room, and the existing hop barn will be converted into a private marketing space with a kitchen and two guest rooms. The two buildings will be connected by a bridge, which will also be constructed. On the western side the roadway, a new 60,000-case winery production facility with a cave area for wine barrel storage will be constructed. These facilities will not be open to the public except by invitation. Additionally, entryways, driveways, parking, walkways and site accessibility features are included in the project.

The winery operations will include public tasting, retail sales, and trade-related special events. The staff will include fifteen employees between the winery and the tasting room. On average, 52 visitors per day is expected for tasting. The Project application includes provisions for 24 special events per year. These include 10 events with 30 people in attendance, five 60-person catered events, participation in five 120-person industry-wide events, and four 300-person outdoor events.

The winery is situated on a 75-acre parcel of land formerly occupied by Westside Farms. The property is bordered to the north by Gracianna Winery, to the northwest by Arista Winery, to the west by Williams Selyem Winery, and to the south and east by the Russian River. On the opposite side of the river is Riverfront Regional Park. To the south of the property lie single-family residences, as well. This report includes a summary of applicable noise regulations, the results of a noise monitoring survey conducted for the Project, and an assessment of noise impacts and mitigation measures necessary to meet the applicable County standards at adjacent noise sensitive land uses. Persons not familiar with environmental noise analysis are referred to Appendix A for additional discussion.

Figure 1. Winery Site Plan and Measurement Locations



REGULATORY BACKGROUND

The Sonoma County Noise Element of the 2000 General Plan identifies a goal to:

> *Protect people from the adverse effects of exposure to excessive noise and to achieve an environment in which people and land uses function without impairment from noise.*

The following policies, which are applicable for use at the Project, are intended to achieve this goal:

NE-1c: Control non-transportation-related noise from new projects. The total noise level resulting from new sources shall not exceed the standards in Table NE-2 of the recommended revised policies as measured at the exterior property line of any adjacent noise-sensitive land use. Limit exceptions to the following:

1. If the ambient noise level exceeds the standard in Table NE-2, adjust the standard to equal the ambient level, up to a maximum of five dBA above the standard, provided that no measurable increase (i.e., +/- 1.5 dBA) shall be allowed.
2. Reduce the applicable standards in Table NE-2 by five dBA for simple tone noises, noises consisting primarily of speech or music, or for recurring impulsive noises, such as pile drivers and barking dogs at kennels.
3. Reduce the applicable standards in Table NE-2 by five dBA if the proposed use exceeds the ambient level by 10 dBA or more.
4. For short-term noise sources, which are permitted to operate no more than six days per year, such as concerts or race events, the allowable noise exposures shown in Table NE-2 may be increased by five dB. These events shall be subject to a noise management plan, including provisions for maximum noise level limits, noise monitoring, complaint response, and allowable hours of operation. The plan shall address potential cumulative noise impacts from all events in the area.
5. Noise levels may be measured at the location of the outdoor activity area of the noise-sensitive land use, rather than at the exterior property line of the adjacent noise-sensitive use, where:
    a. The property on which the noise-sensitive use is located has already been substantially developed pursuant to its existing zoning, and
    b. There is available open land on these noise-sensitive lands for noise attenuation.

    Note, this exception may not be used for vacant properties, which are zoned to all noise-sensitive uses.

Table 1. Maximum Allowable Noise Exposures for Non-Transportation Sources (Table NE-2)

Hourly Noise Metric[1]	Maximum Exterior Noise Level Standards, dBA	
	Daytime: 7:00 a.m. to 10:00 p.m.	Nighttime: 10:00 p.m. to 7:00 a.m.
L_{50} (30 minutes in any hour)	50	45
L_{25} (15 minutes in any hour)	55	50
L_{08} (5 minutes in any hour)	60	55
L_{02} (1 minute in any hour)	65	60

[1] The sound level exceeded n% of the time in any hour. For example, the L_{50} is the value exceeded 50% of the time or 30 minutes in any hour; this is the median noise level. The L_{02} is the sound level exceeded one minute in any hour.

EXISTING NOISE ENVIRONMENT

AMBIENT NOISE LEVELS

The primary ambient source of noise in the project area is the traffic along Westside Road. Other contributors to noise include airplanes flying overhead and agricultural-related activities in the area. To evaluate ambient noise levels on the project site at the closest noise-sensitive land uses, an ambient noise monitoring survey, consisting of two long-term noise measurements, was conducted between 3:00 p.m. on Friday, August 23, 2013, and 5:00 p.m. on Wednesday, August 28, 2013. LT-1 was located on the southern end of the property, approximately 110 feet (34 meters) from the centerline of Westside Road. This location represents the neighboring single-family residences. LT-2 was located at the tree line on the eastern boundary of the project site. Positioned approximately 185 feet (56 meters) from the Russian River, this long-term measurement location captured ambient noise away from Westside Road, which is in the vicinity of Riverfront Regional Park. Figure 1 shows the approximate locations of both measurement sites.

The hourly trends in noise levels at LT-1 and LT-2 are shown in Figures 2 and 3, respectively. Included in each figure are the energy equivalent noise level, L_{eq}, and the statistical noise levels consistent with the limits set forth in Table NE-2 (noise levels exceeded 2, 8, 25, and 50 percent of the time).

Figure 2. Measured Noise Levels at LT-1

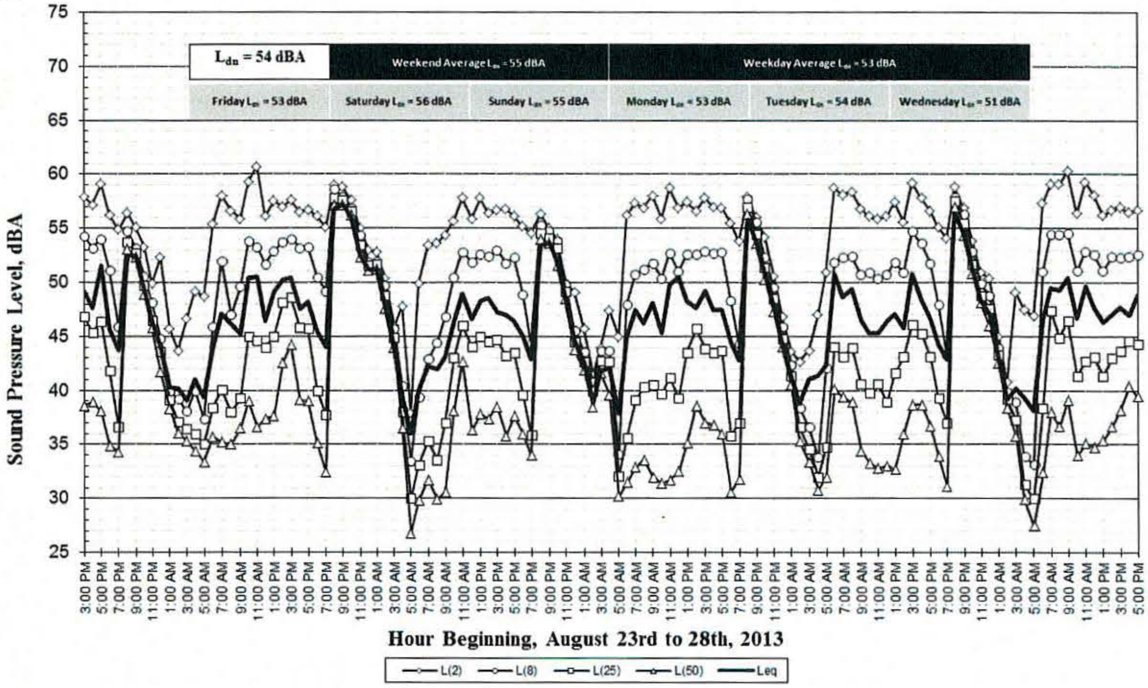


Figure 3. Measured Noise Levels at LT-2

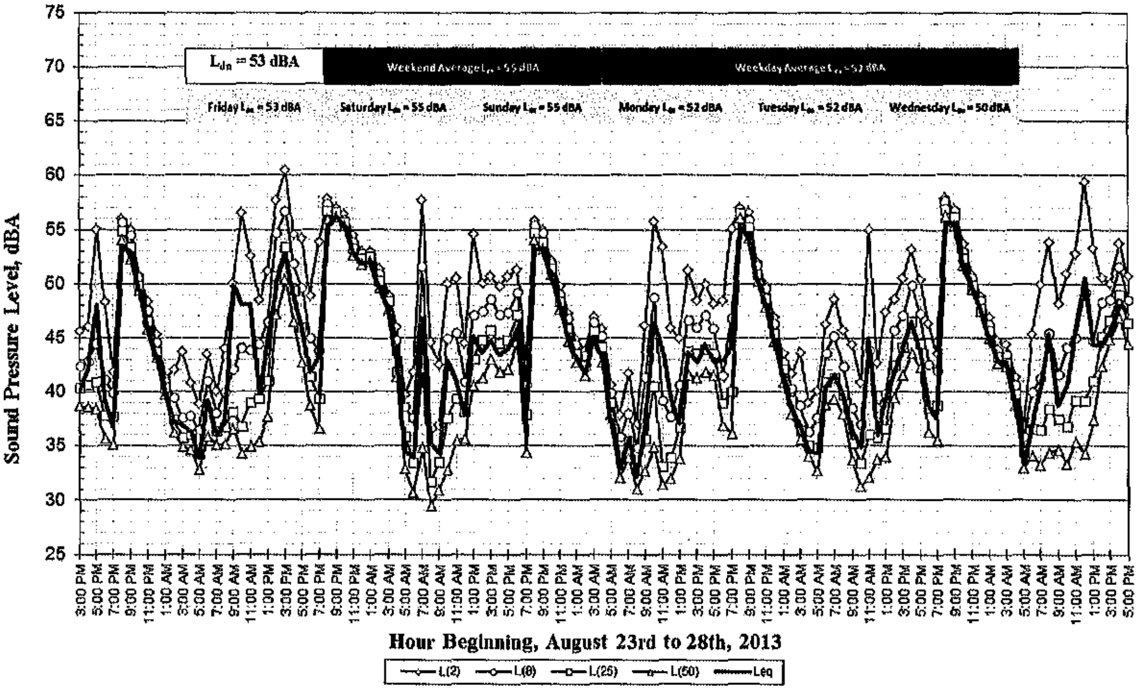

From Figure 2, the daytime L_{eq} for the weekend (i.e., Saturday and Sunday) at LT-1 ranged from 42 to 57 dBA, with an average L_{eq} of 50 dBA. The nighttime L_{eq} for the weekend at LT-1 ranged from 36 to 56 dBA, with an average L_{eq} of 49 dBA. During the weekdays (i.e., Friday, Monday, Tuesday, and Wednesday), the average daytime and nighttime averages for L_{eq} ranged from 43 to 56 dBA, with an average of 50 dBA, and from 38 to 51 dBA, with an average of 46 dBA, respectively. The day-night average noise level, which is the L_{dn}, at LT-1 measured to be 55 dBA on the weekend and 53 dBA on the weekday. The overall L_{dn} for the entire testing period was 54 dBA. The chart in Figure 2 shows the average L_{dn} for each day of testing. The daytime and nighttime noise descriptors used to interpret the County's Noise Performance Standards at LT-1 for the measurement period are shown in Table 2.

For LT-2, which is shown in Figure 3, the average L_{eq} measurements from the weekend ranged from 34 to 56 dBA in the daytime, with an average of 49 dBA, and from 34 to 55 dBA in the nighttime, with an average of 48 dBA. On the weekdays, the average L_{eq} in the daytime ranged from 32 to 56 dBA, with an average of 48 dBA. In the nighttime, the average weekday L_{eq} ranged from 33 to 52 dBA, with an average of 45 dBA. The average weekend L_{dn} was 55 dBA, and on the weekday, the L_{dn} was approximately 52 dBA. The overall L_{dn} for the entire testing period at LT-2 was 53 dBA. The calculated L_{dn} for each day of testing is shown in Figure 3. The Noise Performance Standards at LT-2 are summarized in Table 2.

In comparing the hourly noise levels for each long-term measurement location, notice that the median noise levels, L_{50}, during the nighttime hours of 10:00 p.m. to 7:00 a.m. drop well-below 30 dBA on two different occasions near the roadway at LT-1 but barely drop as low as 30 dBA at LT-2 during the same period of time. This higher nighttime ambient noise further from the roadway is likely due to nighttime woodland insect noise.

Based on the results from LT-1 and LT-2, the L_{dn} levels measured on the weekend were approximately 2 to 3 dBA higher than on the weekdays. The weekend L_{eq} levels in the daytime were approximately 0 to 1 dBA higher than the weekdays, and in the nighttime, the weekend L_{eq} levels averaged to be approximately 3 dBA higher than on the weekdays. Since winery-related noise generally occurs at the same or higher rates on the weekends, ambient noise from the weekends will be used to conduct the impact assessment for the worst-case scenario.

Table 2: Measured Ambient Noise Levels

Hourly Noise Metric	Exterior Ambient Noise Levels			
	LT-1 (southern property line near Westside Road Noise)		LT-2 (eastern property line away from Westside Road Noise)	
	Avg. Daytime Level (Range)	Avg. Nighttime Level (Range)	Avg. Daytime Level (Range)	Avg. Nighttime Level (Range)
L_{50} (30 Min.)	**48** (34 to 58)	**47** (30 to 57)	**48** (32 to 57)	**47** (34 to 56)
L_{25} (15 Min.)	**52** (41 to 58)	**48** (33 to 57)	**49** (35 to 58)	**48** (36 to 56)
L_{08} (5 Min.)	**53** (43 to 59)	**48** (33 to 57)	**50** (35 to 58)	**48** (36 to 56)
L_{02} (1 Min.)	**57** (53 to 61)	**51** (38 to 59)	**53** (37 to 61)	**49** (37 to 56)

NOISE ASSESSMENT

Estimating the expected noise produced by, and impacts from, the proposed project at adjacent noise-sensitive uses requires three elements: 1) identification of what noise-producing operations are likely to occur; 2) the typical noise source levels for those operations; and 3) the temporal nature of the operations.

I. Identification of Noise-Producing Operations/Uses

There are a number of operations associated with wine production and events at the proposed facility that will produce noise. These include:

1. Project traffic;
2. Winery and seasonal production operations;
3. Maintenance and forklift operations; and
4. Special event noise.

II. Typical Noise Source Levels

To estimate the noise levels associated with project operations, some attention must be given to the temporal nature of the noise produced. Below each of the major winery-related noise-producing operations outlined above are discussed:

1. *Project Traffic* would produce the following type and range of traffic noise levels:
    a. Automobile and light-vehicle traffic accessing the tasting room would occur during the daytime hours, and noise produced is expected to include the sounds of vehicles accessing parking areas, engine starts, door slams, etc. These noises typically range from a maximum of 53 to 63 dBA at 50 feet (15 meters).
    b. The majority of truck traffic on the project site is expected to primarily access the winery building on the western side of Westside Road, though some truck traffic may also access other portions of the site. Noise levels generated by truck traffic are dependent on the size and speed of trucks; typically, maximum noise levels generated

by heavy-duty (i.e., semi-tractor trailer type) trucks would range from 70 dBA when traveling at constant speeds to 75 dBA when stopping/starting and maneuvering at a distance of 50 feet (15 meters). Medium (box type and delivery) trucks would typically have maximum levels ranging from 60 dBA when traveling at constant speeds to 65 dBA when stopping/starting and maneuvering at a distance of 50 feet.

2. *Winery and Seasonal Production Operations* would produce the following type and range of noise levels:
    a. Refrigeration equipment, as a maximum condition, is assumed to operate under constant conditions during the day and night. Though the model, type, and capacities of the cooling compressors for the facility are not specified, field measurements of such equipment show that sound levels from such equipment can produce levels between 50 and 65 dBA at 50 feet, with L_{50} noise levels of 60 dBA at 50 feet.
    b. Air compressors used for various processes in the facility typically cycle on and off based on the need for compressed air. Though the model, type, and capacities of the cooling compressors for the facility are not specified, we can estimate results based on field measurements of cooling compressors at other wineries. The equipment is expected to produce L_{50} sound levels of 62 dBA at 50 feet.
    c. Bottling would be constant on an hourly basis, although it is likely to occur for only a few weeks each year. Based on sound level measurements of bottling lines at other wineries, bottling operations can be expected to produce L_{50} sound levels between 65 and 70 dBA at 50 feet.
    d. Crush activities at medium to large-sized wineries typically occur for approximately two months each year. The majority of the noise sources associated with the crush include the operation of hoppers, presses, de-stemmers, separators, crushers, air compressors, forklifts, conveyors, etc. Average noise levels resulting from the crush are typically constant on an hourly basis. Individual pieces of crush-specific equipment, such as the separators and de-stemmers, are relatively quiet with sound levels around 50 dBA L_{eq} at approximately 50 feet. The composite crush activities at a large sized winery, such as a 60,000-case capacity facility, typically generate noise levels of approximately 66 dBA L_{eq} at a distance of 50 feet from the center of operations. During the crush, discrete maximum noise events, such as the setting of empty bins, may reach 70 to 80 dBA L_{max} or L_{02} at 50 feet from the center of operations.
3. *Maintenance and Forklift Operations* would produce intermittent noise depending upon the exact nature of the operation. These would likely occur at a much slower than a daily rate; although operations may span several hours, once initiated. Backup alarms (or beepers), which are repetitive and irritating by design, would also produce noise during these activities, and as with forklift operations, are expected to be intermittent by nature. Forklift use and associated backup alarm noise would be partially attenuated during crush-related activities by structure of the production building. Based on experience with other winery operations, it can be estimated that non-attenuated L_{08} noise levels from these operations may reach levels of 66 to 67 dBA at 50 feet.
4. *Special Events Noise*, such as concerts and weddings are not planned, nor requested, at the winery. The winery does plan to participate in industry-related events, averaging approximately 24 per year. Based on review of site plans, indoor events would be held in the building connected to the tasting room by a constructed bridge or within the walnut grove at the east boundary of the site. The baling barn will be located across the street from the production facilities. Table 3 summarizes typical noise levels generated by small-to-moderate sized events at distances of 50 feet from the source.

Ms. Becky Ver Meer
Permit and Resource Management Department
Sonoma County
2550 Ventura Avenue
Santa Rosa, California 95403

Subject: **Ramey Winery Project, Sonoma County, CA**
Environmental Noise Assessment Addendum

Dear Ms. Ver Meer:

The nearest residence to the proposed Ramey Winery Project site is adjacent to the proposed project site along the southern boundary. The shared property line would be approximately 1,340 feet from the Walnut Grove picnic grounds located along the eastern boundary of the project site. At the picnic grounds, outdoor special events are expected to take place. Based on the noise levels for typical noise sources that would occur during promotional events, noise levels at the shared property line of the nearest residence was calculated. Table 1 summarizes the results at this distance.

Outdoor amplified music at the Walnut Grove picnic area would exceed the County NE-2 standard at the property line of the nearest residence during nighttime hours by 1 dBA. There are no special events activities that would cause noise levels in excess of the standard during daytime hours at this location.

Table 1. Outdoor Special Events L_{50} Noise Levels in the Picnic Grove Area

Films – Voices/Music Exceeds Adjusted NE-2?	No (day & night)
Raised Conversation Exceeds Adjusted NE-2?	No (day & night)

Mitigation: Special/Promotional Events

In addition to the impacts expressed in the original noise report, dated October 2, 2014, for special/promotional events, outdoor amplified music at the Walnut Grove picnic area would exceed the County NE-2 standard during nighttime hours at the property line of the nearest residence located to the south of the project site. The following mitigation measures were proposed in the original noise report and would also suffice for the impact at the shared property line:

1. Amplified music and speech at events should only occur during daytime hours within the events barn or tasting room buildings, assuming the windows and doors are open, or in the picnic grove.

2. Outdoor events in the vicinity of the winery with non-amplified outdoor music and/or speech may occur outdoors only during daytime hours (7:00 a.m. to 10:00 p.m.).

3. Any outdoor event occurring beyond 10:00 p.m. should be moved indoors.

4. A noise management plan should be developed for daytime outdoor events with amplified music to allow for these events to be held in accordance with provision 4 of NE-1c of the Sonoma County Noise Element. Through this provision, allowable noise exposures can increase by 5 dB. As such, up to six daytime events with amplified music would be allowed, as predicted noise levels would fall at or below the short-term noise source limit.

With the implementation of these mitigation measures, noise levels would be maintained at or below the County NE-2 standard.

Job No. 13-155

INTRODUCTION

This noise assessment evaluates the existing noise environment and the potential for increased noise as a result of the proposed Ramey Wine Cellars Project (Project) on a parcel located at 7097 Westside Road near the City of Healdsburg in an unincorporated area of Sonoma County. Figure 1 shows a site map of the property. The proposed project includes production of 60,000 cases of wine, a tasting room, retail sales, and an area designated for trade-related special events. On the eastern side of Westside Road, the existing hop kiln will be converted into a public tasting room, and the existing hop barn will be converted into a private marketing space with a kitchen and two guest rooms. The two buildings will be connected by a bridge, which will also be constructed. On the western side the roadway, a new 60,000-case winery production facility with a cave area for wine barrel storage will be constructed. These facilities will not be open to the public except by invitation. Additionally, entryways, driveways, parking, walkways and site accessibility features are included in the project.

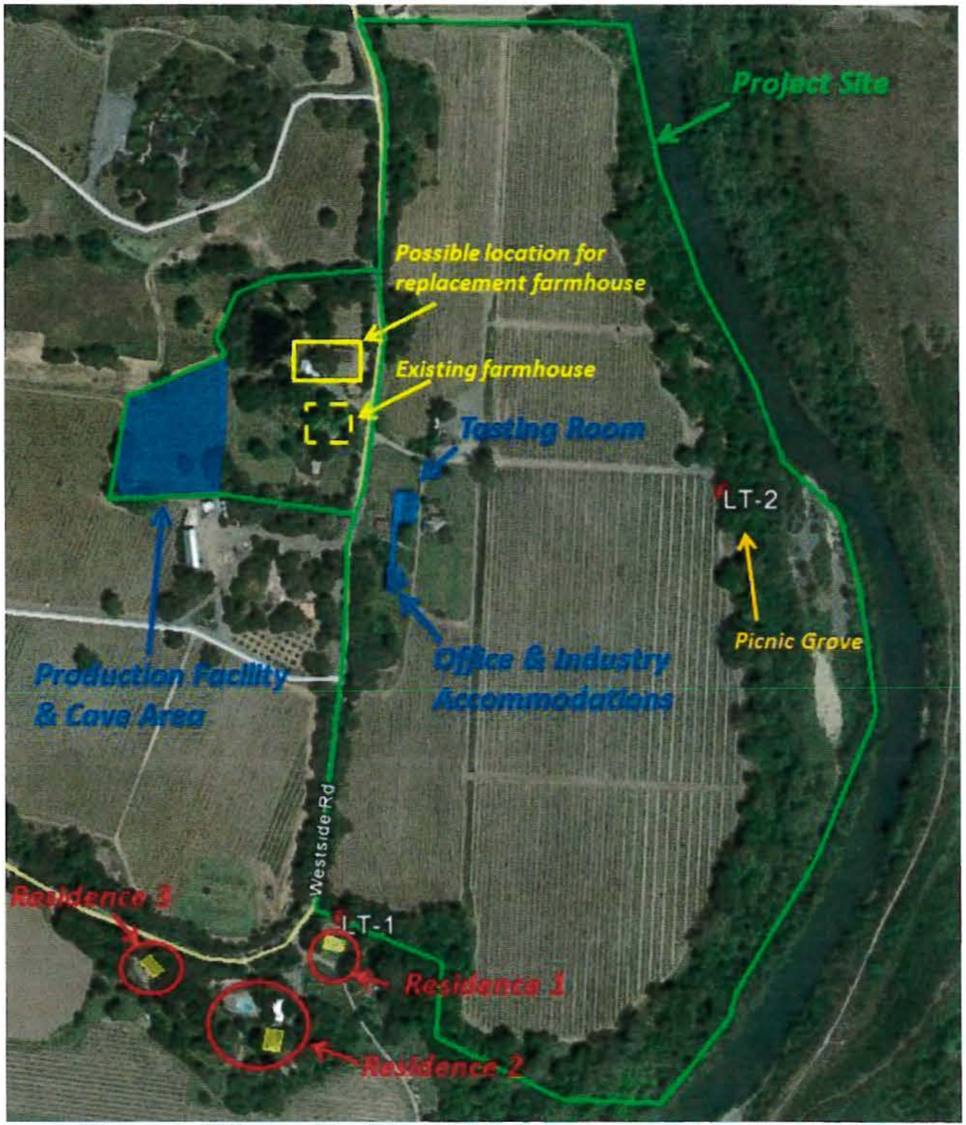

Figure 1. Winery Site Plan and Measurement Locations

The winery operations will include public tasting, retail sales, and trade-related special events. The staff will include fifteen employees between the winery and the tasting room. On average, 52 visitors per day are expected for tasting. The Project application includes provisions for 24 special events per year. These include 10 winemaker lunches or dinners with 30 persons in attendance, five 60-person private tastings, five 120-person private tastings, two 300-person new wine release tastings, and two 300-person industry-wide events. Table 1 summarizes each of the special events proposed at the winery and provides number of guests, locations for the events on the property, and the hours of each event.

The winery is situated on a 75-acre parcel of land formerly occupied by Westside Farms. The property is bordered to the north by Gracianna Winery, to the northwest by Arista Winery, to the west by Williams Selyem Winery, and to the south and east by the Russian River. On the opposite side of the river is Riverfront Regional Park. To the south of the property lie single-family residences, as well. This report includes a summary of applicable noise regulations, the results of a noise monitoring survey conducted for the Project, and an assessment of noise impacts and mitigation measures necessary to meet the applicable County standards at adjacent noise sensitive land uses. Persons not familiar with environmental noise analysis are referred to Appendix A for additional discussion.

Table 1: Ramey Wine Cellars Proposed Events

Event Type	No. of Events per Year	Hours	Maximum No. of Guests	Event Location on the Property
Industry-wide Event	Total of 2 event days per year	10:00 a.m. to 5:00 p.m.[a]	300	Tasting rooms, and outdoor area between tasting rooms, or walnut grove
New wine release tastings – by invitation only	2	9:00 a.m. to 9:00 p.m.	300	Tasting rooms, and outdoor area between tasting rooms, or walnut grove
Private tastings	5	9:00 a.m. to 9:00 p.m.	120	Tasting rooms, outdoor area between tasting rooms, and walnut grove
Private tastings	5	11:00 a.m. to 3:00 p.m. or 6:00 p.m. to 9:00 p.m.	60	Tasting rooms, outdoor area between tasting rooms, and walnut grove
Winemaker lunches or dinners with on-site food preparation, and food and wine pairings	10	11:00 a.m. to 3:00 p.m. or 6:00 p.m. to 9:00 p.m.	30	Baling barn, walnut grove, and winery

[a] Industry-wide events must occur during the public tasting room hours.

REGULATORY BACKGROUND

The Sonoma County Noise Element of the 2000 General Plan identifies a goal to:

> *Protect people from the adverse effects of exposure to excessive noise and to achieve an environment in which people and land uses function without impairment from noise.*

The following policies, which are applicable for use at the Project, are intended to achieve this goal:

NE-1c: Control non-transportation-related noise from new projects. The total noise level resulting from new sources shall not exceed the standards in Table NE-2 of the recommended revised policies as measured at the exterior property line of any adjacent noise-sensitive land use. Limit exceptions to the following:

1. If the ambient noise level exceeds the standard in Table NE-2, adjust the standard to equal the ambient level, up to a maximum of five dBA above the standard, provided that no measurable increase (i.e., +/- 1.5 dBA) shall be allowed.
2. Reduce the applicable standards in Table NE-2 by five dBA for simple tone noises, noises consisting primarily of speech or music, or for recurring impulsive noises, such as pile drivers and barking dogs at kennels.
3. Reduce the applicable standards in Table NE-2 by five dBA if the proposed use exceeds the ambient level by 10 dBA or more.
4. For short-term noise sources, which are permitted to operate no more than six days per year, such as concerts or race events, the allowable noise exposures shown in Table NE-2 may be increased by five dB. These events shall be subject to a noise management plan, including provisions for maximum noise level limits, noise monitoring, complaint response, and allowable hours of operation. The plan shall address potential cumulative noise impacts from all events in the area.
5. Noise levels may be measured at the location of the outdoor activity area of the noise-sensitive land use, rather than at the exterior property line of the adjacent noise-sensitive use, where:
    a. The property on which the noise-sensitive use is located has already been substantially developed pursuant to its existing zoning, and
    b. There is available open land on these noise-sensitive lands for noise attenuation.

    Note, this exception may not be used for vacant properties, which are zoned to all noise-sensitive uses.

Table 2. Maximum Allowable Noise Exposures for Non-Transportation Sources (Table NE-2)

Hourly Noise Metric[1]	Maximum Exterior Noise Level Standards, dBA	
	Daytime: 7:00 a.m. to 10:00 p.m.	Nighttime: 10:00 p.m. to 7:00 a.m.
L_{50} (30 minutes in any hour)	50	45
L_{25} (15 minutes in any hour)	55	50
L_{08} (5 minutes in any hour)	60	55
L_{02} (1 minute in any hour)	65	60

[1] The sound level exceeded n% of the time in any hour. For example, the L_{50} is the value exceeded 50% of the time or 30 minutes in any hour; this is the median noise level. The L_{02} is the sound level exceeded one minute in any hour.

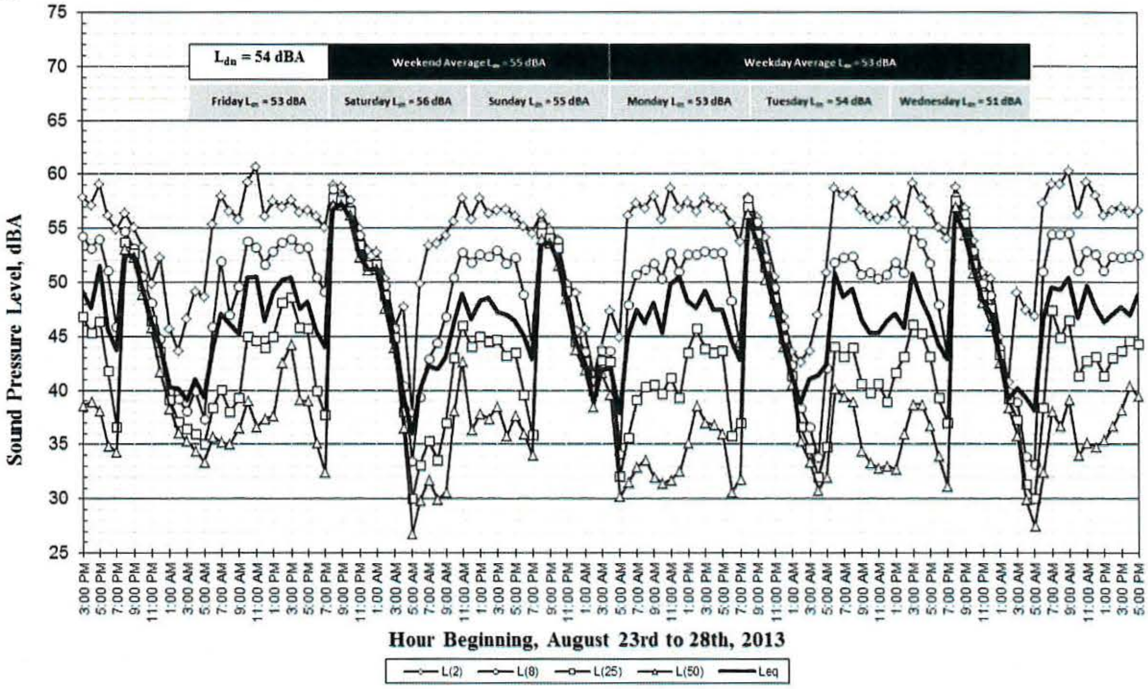
EXISTING NOISE ENVIRONMENT

AMBIENT NOISE LEVELS

The primary ambient source of noise in the project area is the traffic along Westside Road. Other contributors to noise include airplanes flying overhead and agricultural-related activities in the area. To evaluate ambient noise levels on the project site at the closest noise-sensitive land uses, an ambient noise monitoring survey, consisting of two long-term noise measurements, was conducted between 3:00 p.m. on Friday, August 23, 2013, and 5:00 p.m. on Wednesday, August 28, 2013. LT-1 was located on the southern end of the property, approximately 110 feet (34 meters) from the centerline of Westside Road. This location represents the neighboring single-family residences. LT-2 was located at the tree line on the eastern boundary of the project site. Positioned approximately 185 feet (56 meters) from the Russian River, this long-term measurement location captured ambient noise away from Westside Road, which is in the vicinity of Riverfront Regional Park. Figure 1 shows the approximate locations of both measurement sites.

The hourly trends in noise levels at LT-1 and LT-2 are shown in Figures 2 and 3, respectively. Included in each figure are the energy equivalent noise level, L_{eq}, and the statistical noise levels consistent with the limits set forth in Table NE-2 (noise levels exceeded 2, 8, 25, and 50 percent of the time).

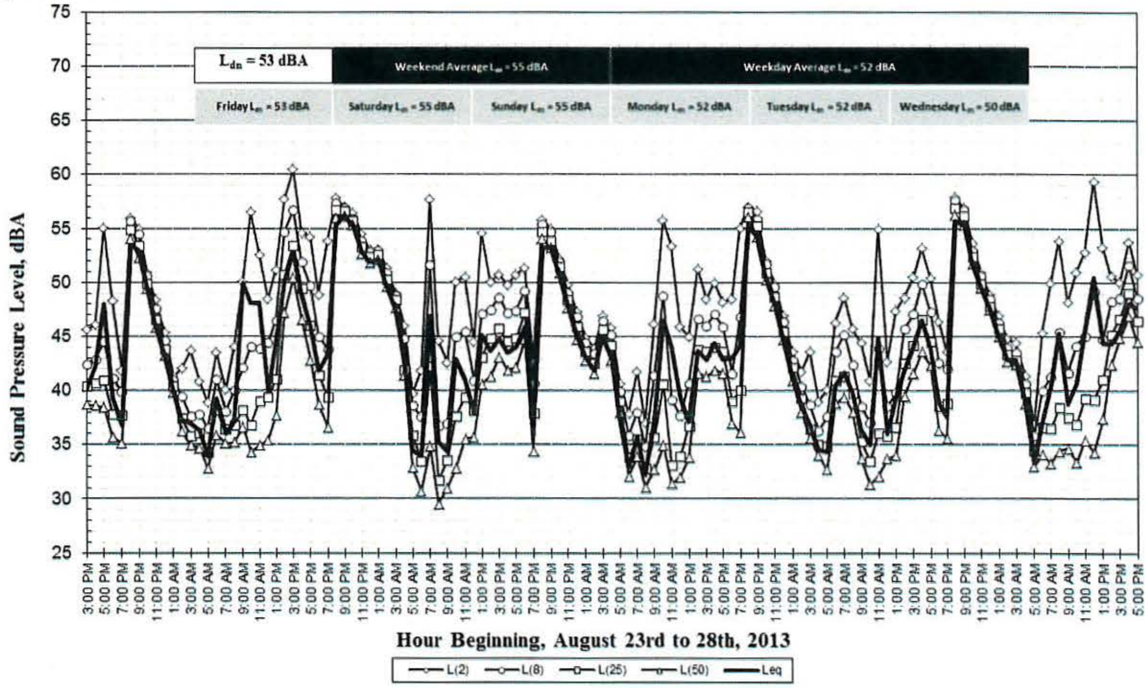
Figure 2. Measured Noise Levels at LT-1



From Figure 2, the daytime L_{eq} for the weekend (i.e., Saturday and Sunday) at LT-1 ranged from 42 to 57 dBA, with an average L_{eq} of 50 dBA. The nighttime L_{eq} for the weekend at LT-1 ranged from 36 to 56 dBA, with an average L_{eq} of 49 dBA. During the weekdays (i.e., Friday, Monday, Tuesday, and Wednesday), the average daytime and nighttime averages for L_{eq} ranged from 43 to 56 dBA, with an average of 50 dBA, and from 38 to 51 dBA, with an average of 46 dBA, respectively. The day-night average noise level, which is the L_{dn}, at LT-1 measured to be 55 dBA on the weekend and 53 dBA on the weekday. The overall L_{dn} for the entire testing period was 54 dBA. The chart in Figure 2 shows the average L_{dn} for each day of testing. The daytime and nighttime noise descriptors used to interpret the County's Noise Performance Standards at LT-1 for the measurement period are shown in Table 3.

For LT-2, which is shown in Figure 3, the average L_{eq} measurements from the weekend ranged from 34 to 56 dBA in the daytime, with an average of 49 dBA, and from 34 to 55 dBA in the nighttime, with an average of 48 dBA. On the weekdays, the average L_{eq} in the daytime ranged from 32 to 56 dBA, with an average of 48 dBA. In the nighttime, the average weekday L_{eq} ranged from 33 to 52 dBA, with an average of 45 dBA. The average weekend L_{dn} was 55 dBA, and on the weekday, the L_{dn} was approximately 52 dBA. The overall L_{dn} for the entire testing period at LT-2 was 53 dBA. The calculated L_{dn} for each day of testing is shown in Figure 3. The Noise Performance Standards at LT-2 are summarized in Table 3.

Figure 3. Measured Noise Levels at LT-2



In comparing the hourly noise levels for each long-term measurement location, notice that the median noise levels, L_{50}, during the nighttime hours of 10:00 p.m. to 7:00 a.m. drop well-below 30 dBA on two different occasions near the roadway at LT-1 but barely drop as low as 30 dBA at LT-2 during the same period of time. This higher nighttime ambient noise further from the roadway is likely due to nighttime woodland insect noise.

Based on the results from LT-1 and LT-2, the L_{dn} levels measured on the weekend were approximately 2 to 3 dBA higher than on the weekdays. The weekend L_{eq} levels in the daytime were approximately 0 to 1 dBA higher than the weekdays, and in the nighttime, the weekend L_{eq} levels averaged to be approximately 3 dBA higher than on the weekdays. Since winery-related noise generally occurs at the same or higher rates on the weekends, ambient noise from the weekends will be used to conduct the impact assessment for the worst-case scenario.

Table 3: Measured Ambient Noise Levels

Hourly Noise Metric	**Exterior Ambient Noise Levels**			
	LT-1 (southern property line near Westside Road Noise)		**LT-2 (eastern property line away from Westside Road Noise)**	
	Avg. Daytime Level (Range)	**Avg. Nighttime Level** (Range)	**Avg. Daytime Level** (Range)	**Avg. Nighttime Level** (Range)
L_{50} (30 Min.)	**48** (34 to 58)	**47** (30 to 57)	**48** (32 to 57)	**47** (34 to 56)
L_{25} (15 Min.)	**52** (41 to 58)	**48** (33 to 57)	**49** (35 to 58)	**48** (36 to 56)

NOISE ASSESSMENT

Estimating the expected noise produced by, and impacts from, the proposed project at adjacent noise-sensitive uses requires three elements: 1) identification of what noise-producing operations are likely to occur; 2) the typical noise source levels for those operations; and 3) the temporal nature of the operations.

I. Identification of Noise-Producing Operations/Uses

There are a number of operations associated with wine production and events at the proposed facility that will produce noise. These include:

1. Project traffic;
2. Winery and seasonal production operations;
3. Maintenance and forklift operations; and
4. Special event noise.

II. Typical Noise Source Levels

To estimate the noise levels associated with project operations, some attention must be given to the temporal nature of the noise produced. Below each of the major winery-related noise-producing operations outlined above are discussed:

1. *Project Traffic* would produce the following type and range of traffic noise levels:
    a. Automobile and light-vehicle traffic accessing the tasting room would occur during the daytime hours, and noise produced is expected to include the sounds of vehicles accessing parking areas, engine starts, door slams, etc. These noises typically range from a maximum of 53 to 63 dBA at 50 feet (15 meters).
    b. The majority of truck traffic on the project site is expected to primarily access the winery building on the western side of Westside Road, though some truck traffic may also access other portions of the site. Noise levels generated by truck traffic are dependent on the size and speed of trucks; typically, maximum noise levels generated by heavy-duty (i.e., semi-tractor trailer type) trucks would range from 70 dBA when traveling at constant speeds to 75 dBA when stopping/starting and maneuvering at a distance of 50 feet (15 meters). Medium (box type and delivery) trucks would typically have maximum levels ranging

from 60 dBA when traveling at constant speeds to 65 dBA when stopping/starting and maneuvering at a distance of 50 feet.

2. *Winery and Seasonal Production Operations* would produce the following type and range of noise levels:
   a. Refrigeration equipment, as a maximum condition, is assumed to operate under constant conditions during the day and night. Though the model, type, and capacities of the cooling compressors for the facility are not specified, field measurements of such equipment show that sound levels from such equipment can produce levels between 50 and 65 dBA at 50 feet, with L_{50} noise levels of 60 dBA at 50 feet.
   b. Air compressors used for various processes in the facility typically cycle on and off based on the need for compressed air. Though the model, type, and capacities of the cooling compressors for the facility are not specified, we can estimate results based on field measurements of cooling compressors at other wineries. The equipment is expected to produce L_{50} sound levels of 62 dBA at 50 feet.
   c. Bottling would be constant on an hourly basis, although it is likely to occur for only a few weeks each year. Based on sound level measurements of bottling lines at other wineries, bottling operations can be expected to produce L_{50} sound levels between 65 and 70 dBA at 50 feet.
   d. Crush activities at medium to large-sized wineries typically occur for approximately two months each year. The majority of the noise sources associated with the crush include the operation of hoppers, presses, de-stemmers, separators, crushers, air compressors, forklifts, conveyors, etc. Average noise levels resulting from the crush are typically constant on an hourly basis. Individual pieces of crush-specific equipment, such as the separators and de-stemmers, are relatively quiet with sound levels around 50 dBA L_{eq} at approximately 50 feet. The composite crush activities at a large sized winery, such as a 60,000-case capacity facility, typically generate noise levels of approximately 66 dBA L_{eq} at a distance of 50 feet from the center of operations. During the crush, discrete maximum noise events, such as the setting of empty bins, may reach 70 to 80 dBA L_{max} or L_{02} at 50 feet from the center of operations.

3. *Maintenance and Forklift Operations* would produce intermittent noise depending upon the exact nature of the operation. These would likely occur at a much slower than a daily rate; although operations may span several hours, once initiated. Backup alarms (or beepers), which are repetitive and irritating by design, would also produce noise during these activities, and as with forklift operations, are expected to be intermittent by nature. Forklift use and associated backup alarm noise would be partially attenuated during crush-related activities by structure of the production building. Based on experience with other winery operations, it can be estimated that non-attenuated L_{08} noise levels from these operations may reach levels of 66 to 67 dBA at 50 feet.

4. *Special Events Noise*, such as concerts and weddings are not planned, nor requested, at the winery. The winery does plan to participate in industry-related events, averaging approximately 24 per year, which are summarized above in Table 1. The baling barn will be located across the street from the production facilities. Table 4, following, summarizes typical noise levels generated by small-to-moderate sized events at distances of 50 feet from the source which have been developed from measurements conducted by Illingworth & Rodkin at actual wedding and non-concert celebration/party events in the Northbay and

throughout the Bay Area[1]. The proposed project would not include amplified music or amplified speech at outdoor events.

In addition to the use of these vetted Event Source Levels, the project applicant has been asked by County Staff to evaluate amplified music events against a peak[2] L_{50} level for musical instruments of 88 dBA at 40 feet. We would note though actual peak (e.g. maximum) levels for musical instruments may reach this level, average sound levels would likely result in uncomfortably high sound levels for winery visitor (100 dBA at 10 feet from the music source). However, in keeping with the County's request, and to conduct an extremely conservative analysis of the impact of the amplified music at winery events, the L_{50} levels for amplified musical instruments of 88 dBA at 40 feet has been used in this analysis.

Table 4: Typical Noise Source Levels for Promotional Events (A-Weighted L_{50} Levels)

Event or Activity	Typical Noise Level @ 50 ft
Amplified Music[b]	72 dBA
Amplified Speech	71 dBA
Non-amplified (acoustic) Music	67 dBA
Films – Voices/Music	64 dBA
Raised Conversation	65 dBA

[b]Amplified concert-type music events are not proposed – such events would increase L_{50} noise levels to 80 dBA at 50 feet.

III. Propagation of sound

The final step in estimating the project noise levels is assessing the propagation of sound to the sensitive receptors. To do this, it is necessary to assume some rate of sound attenuation between the operations and receiver locations. The most dominant physical effect is due to the spreading out of sound waves with distance. For simple, single sources, such as fixed equipment and stationary truck operations, the divergence of the sound wave is hemispherical in nature, producing a reduction of 6 dB with each doubling of distance. For moving sources of noise, such as automobile traffic or truck movements, which are considered linear sources of noise, the divergence of the sound wave is cylindrical in nature, producing a reduction of 3 to 4 ½ dB with each doubling of distance. Other effects can modify these fall-off rates, such as partial shielding from buildings or topography, atmospheric attenuation of sound, ground absorption, and meteorological effects. These effects almost always reduce the noise, in addition to that due to sound divergence. As most of these effects will vary with time due to changing environmental conditions, it is most conservative to assume only attenuation due to divergence for outdoor activities and conservative (minimal) rate of structural attenuation (12 dBA) when operations are conducted within buildings, realizing that the actual noise level will be at or, most likely, below those predicted using this assumption at any one time.

---

[1] These source levels have been used to analyze amplified music at non-concert type special events at over 30 winery projects since the current Sonoma County General Plan (2020) was adopted and have been also adopted by the Sonoma County Winery Event Working Group as typical noise levels for winery event activities.

2 The use of the term "peak" in describing an L_{50} level has been reported from the source used by County Staff; however, we would note that such a term appears to be an oxymoron since the statistically based L_{50} (or median level) is by definition an average and not a peak level.

To evaluate noise impacts on area noise sensitive uses, noise levels were propagated to three representative residences. There is also an existing farmhouse on the project site to the west of Westside Road. This residence is to be demolished, and therefore, does not require noise propagation calculations. Noise propagation calculations were completed on the following residences (see Figure 1 for locations):

1. *Residence 1*: This residence is located in the vicinity of LT-1. It is south of the project site on the same side of Westside Road as the tasting room and public and private tasting rooms and therefore on the opposite side as the wine production building. The residence is approximately 75 feet (23 meters) from the centerline of Westside Road. The front yard of this home is represented by the calculated noise levels for monitoring position LT-1.
2. *Residence 2*: This residence is also located to the south of the project site. Residence 2 is also south of Residence 1 and slightly west. Since Westside Road turns westward just south of Residence 1, the alignment of Residence 2 is such that it is located directly south of the wine production building. This property includes an outdoor pool area that is approximately 100 to 170 feet (30 to 52 meters) from the centerline of Westside Road. The front yard of the home ranges from 52 to 180 feet (16 to 55 meters) from the centerline of the roadway, and the front façade of the home is 190 to 215 feet (58 to 66 meters) from the roadway centerline. Due to the proximity of the home to LT-1, the calculated noise levels at this monitoring location are represented by LT-1 minus 3 dBA.
3. *Residence 3*: While on the same side of Westside Road as Residences 1 and 2, the geometry of the roadway is such that Residence 3 is southwest of the wine production building. Positioned approximately 50 to 75 feet (15 to 23 meters) from the centerline of Westside Road, this home is also best represented by LT-1 plus 3 dBA.

Ambient noise levels at these residences under worst case (i.e., weekend) conditions were calculated using the sound level differences noted above and the measurement results shown in Table 3 for the long-term noise measurement, LT-1. Table 5 summarizes the calculated levels for all four residences.

Table 5: Calculated Ambient Noise Levels at Adjacent Noise-Sensitive Uses

Hourly Noise Metric	Exterior Ambient Noise Levels, dBA					
	Residence 1		Residence 2		Residence 3	
	Avg. Daytime Level	Avg. Nighttime Level	Avg. Daytime Level	Avg. Nighttime Level	Avg. Daytime Level	Avg. Nighttime Level
L_{50} (30 min.)	48	47	45	44	51	50
L_{25} (15 min.)	52	48	49	45	55	51
L_{08} (5 min.)	53	48	50	45	56	51
L_{02} (1 min.)	57	51	54	48	60	54

IMPACT ASSESSMENT

Impact 1: Traffic, Parking Lot and Truck Noise

Automobile parking and traffic

On the east side Westside Road where the tasting room and office and industry accommodations are located, the existing driveways and parking areas will be used. The parking lot will be enhanced, but the general location will remain the same. Residence 1 (represented by LT-1 at the southern boundary of the winery property) is approximately 960 feet from the nearest parking area; Residences 2 (located further south of LT-1 along Westside Road) and 3 (located to the west of LT-1, also along Westside Road) are approximately 1,220 and 1,210 feet, respectively, from the nearest parking area. Based on these distances, noise generated by automobile and light vehicles would be between 28 and 38 dBA at Residence 1 and between 25 and 35 dBA at both Residences 2 and 3. Given the expected visitor and employee use, these activities are expected to occur for less than five minutes out of an hour on a typical day and fall in the L_{02} NE-2 daytime category of 65 dBA (see Table 2). However, during events or on busy weekends, such activities may occur more frequently and fall in the L_{08} NE-2 daytime category of 60 dBA. The ambient noise environment in this area is described by measurements at site LT-1. Table 6 summarizes the assessment of automobile noise in driveways and in parking lots.

Table 6: Driveway and Parking Lot Automobile L_{08} Noise Levels

	L_{08} (Noise Level Exceeded 5 minutes in Any Hour), dBA		
	Residence 1	**Residence 2**	**Residence 3**
Unadjusted Table NE-2 Daytime Limit	60	60	60
Daytime Ambient Noise Levels	53	50	56
Ambient Exceeds NE-2 Limit	No	No	No
NE-2 Adjustment	+0	+0	+0
Driveway/Parking Lot Noise at Receiver	**28 to 38**	**25 to 35**	**25 to 35**
Operations Exceed Ambient by 10 dBA?	No	No	No
NE-2 Adjustment	+0	+0	+0
Adjusted Table NE-2 Daytime Limit	60	60	60
Driveway/Parking Noise Exceeds NE-2?	No	No	No

Based on this finding, noise levels associated with automobiles and light vehicles using the project driveways and parking lots would not exceed the daytime NE-2 noise standards at the nearest residences.

Truck traffic

Trucks visiting the winery site will use the new driveway to access the wine production facility on the west side of the roadway. This main winery access path will take constant speed and maneuvering trucks within respective distances of approximately 1,170 to 1,335 feet of Residence 1, 1,290 to 1,595 feet of Residence 2, and 1,200 to 1,515 feet of Residence 3. Using these distances, noise generated by heavy-duty trucks may range from 48 to 56 dBA at Residence 1 and from 47 to 55 dBA at both Residences 2 and 3. The noise generated by medium-duty trucks ranged from 38 to 46 dBA at Residence 1 and from 37 to 45 dBA at Residences 2 and 3. Truck operations are expected to occur during daytime hours only and on a basis of one to five minutes per hour, or less, since it is unlikely that more than one heavy truck would arrive and depart during any given hour. Thus, truck operations would fall in the L_{02} NE-2 category of 65 dBA (see Table 2) at the adjacent residential uses. Table 7, below, presents and summarizes the assessment of truck traffic noise.

Table 7: Truck L_{02} Noise Levels

	L_{02} (Noise Level Exceeded 1 minute in Any Hour), dBA		
	Residence 1	**Residence 2**	**Residence 3**
Unadjusted Table NE-2 Daytime Limit	65	65	65
Daytime Ambient Noise Levels	57	54	60
Ambient Exceeds NE-2 Limit	No	No	No
NE-2 Adjustment	+0	+0	+0
Heavy Truck Operations at Receiver	**48 to 56**	**47 to 55**	**47 to 55**
Medium Truck Operations at Receiver	**38 to 46**	**37 to 45**	**37 to 45**
Operations Exceed Ambient by 10 dBA?	No	No	No
NE-2 Adjustment	+0	+0	+0
Adjusted Table NE-2 Daytime Limit	65	65	65
Truck Traffic Noise Exceeds NE-2?	No	No	No

Based on these findings, noise associated with truck traffic at the project is not expected to exceed daytime NE-2 noise standards at the nearest residences.

Mitigation 1: None Needed

Impact 2: Mechanical Equipment Noise

The project would likely include noise-generating mechanical equipment, such as air-cooled condensing units, pumps, and compressors, at the wine production facility, as well as less-significant sources of noise, such as air-conditioning systems and exhaust fans. The project description and drawings do not indicate the location of such equipment. This equipment may be located within the structures or positioned so that the structures provide shielding for noise caused by the equipment. However, considering a worst-case scenario where the equipment is placed outside of production buildings and not shielded from the adjacent residences, the equipment may be located as close as 1,210 feet from Residence 1, as 1,300 feet from Residence 2, and as close as 1,170 feet from Residence 3.

Using the source levels discussed above and a 6 dB sound reduction for each doubling of the distance between the noise source and the receivers, constant L_{50} noise levels from mechanical equipment may be between an L_{50} of 32 and 34 dBA at Residences 1 and 2 and between an L_{50} of 33 and 35 dBA at Residence 3. Table 8, following, summarizes the assessment of mechanical equipment noise.

Based on these findings, noise associated with mechanical equipment is not expected to exceed daytime or nighttime NE-2 noise standard at the nearest residences.

Mitigation 2: None Needed

Adjusted Table NE-2 Nighttime Limit	47	45	50
Mechanical Equipment Noise Exceeds NE-2?	No (day & night)	No (day & night)	No (day & night)

Impact 3: Crush-Related Noise

Annual crush-related activities would take place within the new wine production building. The crush pad & press equipment room will be located on the first floor and on the western side of the building, which indicates considerable shielding of crush-related noise by the building itself from the nearby residences. Based on the Winery Floor Plans provided, the space above the crush pad will be open to the second floor, but it is unclear if the area will be open or closed to nature. Assuming the worst case scenario, crush-related activities will be considered to occur outdoors. From the plans for the project site and the building plans, the future location of the crush pad was estimated, and using Google Earth, the distances to the each residence was approximated. The crush pad will be within 1,280 feet of Residence 1, within 1,400 feet of Residence 2 and within 1,275 feet of Residence 3. Using the source levels discussed above and a 6 dB sound reduction for each doubling of the distance, constant L_{50} noise levels from crush-related activities would be approximately 38 dBA at Residence 1, 37 dBA at Residence 2, and 38 dBA at Residence 3. Table 9, below, summarizes these calculations. The maximum noise events discussed above, such as bin drops, etc., would be an L_{02} of 42 to 52 dBA at Residence 1, 41 to 51 dBA at Residence 2, and 42 to 52 dBA at Residence 3. Table 10 summarizes the maximum noise events assessment of crush-related activities.

Adjusted Table NE-2 Nighttime Limit	60	60	60
Crush-Related Noise Exceeds NE-2?	No (day & night)	No (day & night)	No (day & night)

Based on the findings shown, noise associated with crush related noise is not expected to exceed daytime or nighttime NE-2 noise standard at the nearest residences.

Mitigation 3: None Needed

Impact 4: Bottling Noise

According to the building floor plans provided, bottling will be done in the production facility area, next to the truck access loading zone. The building will provide shielding from noise created during bottling activities. The distances from the bottling area to the nearby residences are as follows: 1,225 feet from Residence 1, 1,345 feet from Residence 2, and 1,200 feet from Residence 3. Based on these distances and the noise shielding, noise from bottling activities are expected to be an L_{50} of 37 to 42 dBA at Residence 1, an L_{50} of 36 to 41 dBA at Residence 2, and an L_{50} of 37 to 42 dBA at Residence 3. Table 11 summarizes the assessment of bottling noise.

Table 11: Bottling L_{50} Noise Levels

	L_{50} (Noise Level Exceeded 30 minutes in Any Hour), dBA		
	Residence 1	**Residence 2**	**Residence 3**
Unadjusted Table NE-2 Daytime Limit	50	50	50
Daytime Ambient Noise Levels	48	45	51
Daytime Ambient Exceeds NE-2 Limit?	No	No	**Yes**
Daytime NE-2 Adjustment	+0	+0	+1
Unadjusted Table NE-2 Nighttime Limit	45	45	45

Adjusted Table NE-2 Daytime Limit	50	50	51
Adjusted Table NE-2 Nighttime Limit	47	45	50
Bottling Noise Exceeds NE-2?	No (day & night)	No (day & night)	No (day & night)

Based on these findings, noise associated with bottling is not expected to exceed daytime or nighttime NE-2 noise standard at any of the adjacent residences.

Mitigation 4: None Needed

Impact 5: Maintenance and Forklift Operations

Forklift and maintenance operations would likely take place on the first floor inside the new winery building, in the outdoor crushing and receiving areas, and possibly in the winery caves. Such activities within the winery building would receive significant noise shielding from the building and are not analyzed here. The crushing area would also receive considerable shielding from the building. Outdoor forklift and maintenance operations are considered a worst-case condition and are analyzed. Based on a review of project drawings, the outdoor area closest to the adjacent residences would be the receiving area/truck access, which was mentioned above as being within 1,335 feet of Residence 1, within 1,595 feet of Residence 2, and within 1,515 feet of Residence 3. Using the source levels discussed above and a 6 dB sound reduction for each doubling of the distance between the noise source and the receivers, noise from forklift and maintenance operations activities are expected to be an L_{08} of between 37 and 38 dBA at Residence 1 and an L_{08} of between 36 and 37 dBA at Residences 2 and 3. Table 12, following, summarizes the assessment of noise due to forklift and maintenance operations. Note, forklift and maintenance operations will only occur during the daytime hours.

Table 12: Forklift and Maintenance L_{08} Noise Levels

	L_{08} (Noise Level Exceeded 5 minutes in Any Hour), dBA		
	Residence 1	**Residence 2**	**Residence 3**
Unadjusted Table NE-2 Daytime Limit	60	60	60
Daytime Ambient Noise Levels	53	50	56
Ambient Exceeds NE-2 Limit?	No	No	No

Operations Exceed Ambient by 10 dBA?	No	No	No
NE-2 Adjustment	+0	+0	+0
Adjusted Table NE-2 Daytime Limit	60	60	60
Forklift/Maintenance Operations Noise Exceed NE-2?	No	No	No

Based on the findings shown in Table 12, noise associated with forklift and maintenance operations is not expected to exceed daytime NE-2 noise standard at the nearest residences.

Mitigation 5: None Needed

Impact 6: Event Noise at adjacent residential uses

Special events, such as concerts and weddings, are not planned, nor requested at the winery; however, the winery does plan to participate in county-wide industry events. The project application includes provisions for 24 special events per year, including 10 winemaker lunches or dinners with 30 persons in attendance, five 60-person private tastings, five 120-person private tastings, two 300-person new wine release tastings, and two 300-person industry-wide events. For an event consisting of 300 persons, a staff of approximately 14 people is expected. Table 1 provides locations and hours of these events. It should be noted that amplified music and amplified speech are not proposed at any outdoor events.

A review of the project site plans indicates that outdoor events may be held either on the east side of Westside Road in the vicinity of the tasting room and barn or in the picnic grove area located along the eastern boundary of the property near LT-2. Indoor events would be held inside the tasting room or barn. The production facility on the west side of the roadway will only be opened to guests by invitation only. Based on a review of building plans and elevations, events occurring within the winery buildings would receive noise shielding from the building structures estimated at 12 dBA with open windows and/or doors, and a minimum of 22 dBA with closed non-sound rated windows and/or doors. However, the outdoor events held in the garden area or yard between the tasting room/barn and Westside Road, in the yard south of the barn, in the yard east of the barn, or in the picnic grove area would receive little to no noise attenuation from intervening terrain or building structures at Residences 1, 2, and 3. The outdoor area between the tasting room and the barn would have some shielding from the barn structure.

Based on a review of aerial photos and the project site plan, distance information obtained using Google Earth indicates that outdoor events that take place around the tasting room and baling barn could be situated as close as 690 feet from Residence 1, 900 feet from Residence 2, and 915 feet from Residence 3. The outdoor events taking place in the picnic grove area would be approximately 1,525 feet from Residence 1, 1,775 feet from Residence 2, and 1,900 feet from Residence 3. The event space and guest rooms located in the barn are the closest indoor rooms for events. From the maps, indoor events at these locations would be as close as 885 feet from Residence 1, 1,100 feet from Residence 2, and 1,110 feet from Residence 3. Using these distances and the noise shielding considerations for outdoor and indoor events, the L_{50} sound levels for the typical noise source levels listed in Table 4 (and the County requested *peak* L_{50} level for musical instruments of 88 dBA at 40 feet) for outdoor and indoor events have been calculated at Residences 1, 2, and 3. Tables 13 and 14 summarize the assessments for outdoor special events noise around the winery and in the picnic grove area, respectively. Since amplified music and speech are not proposed at these outdoor events, they are not shown in Tables 13 and 14. Table 15 summarizes the assessment for the indoor special events noise. Since Table 1 indicates that special events would not occur during nighttime hours (10:00 p.m. to 7:00 a.m.), the County's nighttime limits shown in Table NE-2 would not be applicable to the proposed project and are not shown in Tables 13 through 15.

Table 13: Outdoor Special Events L_{50} Noise Levels in the Vicinity of the Winery

NE-2 Limits, Ambient Noise Levels, and Adjustments	**L_{50} (Noise Level Exceeded 30 minutes in Any Hour), dBA**		
	Residence 1	**Residence 2**	**Residence 3**
Unadjusted Table NE-2 Daytime Limit	50	50	50
Daytime Ambient Noise Levels	48	45	51
Daytime Ambient Exceeds NE-2 Limit?	No	No	**Yes**
Daytime NE-2 Ambient Adjustment	+0	+0	+1
NE-2 Adjustment for Speech and Music	-5	-5	-5
Special Event L_{50} Noise Levels	**Residence 1**	**Residence 2**	**Residence 3**
Outdoor Non-Amplified Music	44	42	42
Outdoor Films – Voices/Music	41	39	39
Outdoor Raised Conversation	42	40	40
Adjusted NE-2 Limits and Compliance	**Residence 1**	**Residence 2**	**Residence 3**
Event Noises Exceed Ambient by 10 dBA?	No (all sources)		
NE-2 Adjustment	+0 (all sources)		
Adjusted Table NE-2 Daytime Limit	45	45	46
Non-Amplified Music Exceeds Adjusted NE-2?	No	No	No
Films – Voices/Music Exceeds Adjusted NE-2?	No	No	No
Raised Conversation Exceeds Adjusted NE-2?	No	No	No

Based on the findings shown in Table 13, no impacts are expected during outdoor events in the vicinity of the winery.

Table 14. Outdoor Special Events L_{50} Noise Levels in the Picnic Grove Area

NE-2 Limits, Ambient Noise Levels, and Adjustments	**L_{50} (Noise Level Exceeded 30 minutes in Any Hour), dBA**		
	Residence 1	**Residence 2**	**Residence 3**
Unadjusted Table NE-2 Daytime Limit	50	50	50
Daytime Ambient Noise Levels	48	45	51

Raised Conversation Exceeds Adjusted NE-2?	No	No	No

Notes: 1. Amplified Music levels have been evaluated using a *peak* L_{50} level for musical instruments of 88 dBA at 40 feet as requested by County Staff. The use of these levels results in sound levels 14 dBA higher than those which have been adopted by the Sonoma County Winery Event Working Group and have been used by I&R to analyze amplified music at non-concert type winery events since the adoption of the current (2020) County General Plan. (see discussion on page 7).

Based on the findings shown in Table 15 indoor events with amplified music would exceed the County daytime and nighttime NE-2 standards at all of the three adjacent residences by between 1 to 2 dBA during daytime hours. However, the findings shown in Table 15 indicate that indoor events with amplified speech, non-amplified music, films, or raised conversations would not exceed the County daytime NE-2 standards at any of the adjacent residences.

In terms of exceedances of the County Standards, the above findings for outdoor and indoor events show that amplified music at events within buildings with open windows would exceed the daytime County NE-2 standard at Residences 1, 2 and 3.

Mitigation 6: Special/Promotional Events

Since even noise has the potential to result in levels exceeding the standard fairly significantly, the following measures should be included in the project:

1. Amplified music at events should only occur within the baling barn or tasting room buildings with closed windows and doors.
2. With closed windows and doors, indoor events with amplified speech or music may occur during daytime hours.

APPENDIX A:
FUNDAMENTAL CONCEPTS OF ENVIRONMENTAL ACOUSTICS

Noise may be defined as unwanted sound. Noise is usually objectionable because it is disturbing or annoying. The objectionable nature of sound may be caused by either its *pitch* or its loudness. *Pitch* is the height or depth of a tone or sound, depending on the relative rapidity (frequency) of the vibrations by which it is produced. Higher pitched signals sound louder to humans than sounds with a lower pitch. *Loudness* is intensity of sound waves combined with the reception characteristics of the ear. Intensity may be compared with the height of an ocean wave in that it is a measure of the amplitude of the sound wave.

In addition to the concepts of pitch and loudness, there are several noise measurement scales that are used to describe noise in a particular location. *A decibel (dB)* is a unit of measurement that indicates the relative amplitude of a sound. The zero on the decibel scale is based on the lowest sound level that the healthy, unimpaired human ear can detect. Sound levels in decibels are calculated on a logarithmic basis. An increase of 10 decibels represents a ten-fold increase in acoustic energy, while 20 decibels is 100 times more intense, 30 decibels is 1,000 times more intense, etc. There is a relationship between the subjective noisiness or loudness of a sound and its intensity. Each 10-decibel increase in sound level is perceived as approximately a doubling of loudness over a fairly wide range of intensities. Technical terms are defined in Table A1. There are several methods of characterizing sound. The most common in California is the *A-weighted sound level or dBA.* This scale gives greater weight to the frequencies of sound to which the human ear is most sensitive. Representative outdoor and indoor noise levels in units of dBA are shown in Table A2.

Because sound levels can vary markedly over a short period of time, a method for describing either the average character of the sound or the statistical behavior of the variations must be utilized. Most commonly, environmental sounds are described in terms of an average level that has the same acoustical energy as the summation of all the time-varying events. This energy-equivalent sound/noise descriptor is called L_{eq}. The most common averaging period is hourly, but L_{eq} can describe any series of noise events of arbitrary duration.

The scientific instrument used to measure noise is the sound level meter. Sound level meters can accurately measure environmental noise levels to within about plus or minus 1 dBA. Various computer models are used to predict environmental noise levels from sources, such as roadways and airports. The accuracy of the predicted models depends upon the distance the receptor is from the noise source. Close to the noise source, the models are accurate to within about plus or minus 1 to 2 dBA.

TERM	DEFINITIONS
Decibel, dB	A unit describing the amplitude of sound, equal to 20 times the logarithm to the base 10 of the ratio of the pressure of the sound measured to the reference pressure, which is 20 micropascals (20 micronewtons per square meter).
Frequency, Hz	The number of complete pressure fluctuations per second above and below atmospheric pressure.
A-Weighted Sound Level, dBA	The sound pressure level in decibels as measured on a sound level meter using the A-weighting filter network. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear and correlates well with subjective reactions to noise. All sound levels in this report are A-weighted, unless reported otherwise.
L_{01}, L_{10}, L_{50}, L_{90}	The A-weighted noise levels that are exceeded 1%, 10%, 50%, and 90% of the time during the measurement period.
Equivalent Noise Level, L_{eq}	The average A-weighted noise level during the measurement period.
Day/Night Noise Level, L_{dn}	The average A-weighted noise level during a 24-hour day, obtained after addition of 10 decibels to levels measured in the night between 10:00 pm and 7:00 am.
L_{max}, L_{min}	The maximum and minimum A-weighted noise level during the measurement period.
Ambient Noise Level	The composite of noise from all sources near and far. The normal or existing level of environmental noise at a given location.
Intrusive	That noise which intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of a sound depends upon its amplitude, duration, frequency, and time of occurrence and tonal or informational content as well as the prevailing ambient noise level.

Definitions Of Acoustical Terms **Table A1**

ILLINGWORTH & RODKIN, INC./Acoustical Engineers

Since the sensitivity to noise increases during the evening and at night -- because excessive noise interferes with the ability to sleep -- 24-hour descriptors have been developed that incorporate artificial noise penalties added to quiet-time noise events. The *Day/Night Average Sound Level, Ldn,* is a measure of the cumulative noise exposure in a community, with a 10 dB penalty added to nighttime (10:00 pm - 7:00 am) noise levels.

At a Given Distance From Noise Source	A-Weighted Sound Level in Decibels	Noise Environments	Subjective Impression
	140		
Civil Defense Siren (100')	130		
Jet Takeoff (200')	120		Pain Threshold
	110	Rock Music Concert	
Diesel Pile Driver (100')	100		Very Loud
	90	Boiler Room	
Freight Cars (50')		Printing Press Plant	
Pneumatic Drill (50')	80		
Freeway (100')		In Kitchen With Garbage Disposal Running	
Vacuum Cleaner (10')	70		Moderately Loud
	60	Data Processing Center	
Light Traffic (100')	50	Department Store	
Large Transformer (200')			
	40	Private Business Office	Quiet
Soft Whisper (5')	30	Quiet Bedroom	
	20	Recording Studio	
	10		Threshold of Hearing
	0		

Typical Sound Levels Measured In The Environment And Industry | **Table A2**

ILLINGWORTH & RODKIN, INC./Acoustical Engineers

Effects of Noise

Sleep and Speech Interference: The thresholds for speech interference indoors are about 45 dBA if the noise is steady and above 55 dBA if the noise is fluctuating. Outdoors the thresholds are about 15 dBA higher. Steady noise of sufficient intensity; above 35 dBA, and fluctuating noise levels above about 45 dBA have been shown to affect sleep. Interior residential standards for multi-family dwellings are set by the State of California at 45 dBA L_{dn}. Typically, the highest steady traffic noise level during the daytime is

about equal to the L_{dn} and nighttime levels are 10 dBA lower. The standard is designed for sleep and speech protection and most jurisdictions apply the same criterion for all residential uses. Typical structural attenuation is 12-17 dBA with open windows. With closed windows in good condition, the noise attenuation factor is around 20 dBA for an older structure and 25 dBA for a newer dwelling. Sleep and speech interference is therefore possible when exterior noise levels are about 57-62 dBA L_{dn} with open windows and 65-70 dBA L_{dn} if the windows are closed. Levels of 55-60 dBA are common along collector streets and secondary arterials, while 65-70 dBA is a typical value for a primary/major arterial. Levels of 75-80 dBA are normal noise levels at the first row of development outside a freeway right-of-way. In order to achieve an acceptable interior noise environment, bedrooms facing secondary roadways need to be able to have their windows closed, those facing major roadways and freeways typically need special glass windows.

Annoyance: Attitude surveys are used for measuring the annoyance felt in a community for noises intruding into homes or affecting outdoor activity areas. In these surveys, it was determined that the causes for annoyance include interference with speech, radio and television, house vibrations, and interference with sleep and rest. The L_{dn} as a measure of noise has been found to provide a valid correlation of noise level and the percentage of people annoyed. People have been asked to judge the annoyance caused by aircraft noise and ground transportation noise. There continues to be disagreement about the relative annoyance of these different sources. When measuring the percentage of the population highly annoyed, the threshold for ground vehicle noise is about 55 dBA L_{dn}. At an L_{dn} of about 60 dBA, approximately 2 percent of the population is highly annoyed. When the L_{dn} increases to 70 dBA, the percentage of the population highly annoyed increases to about 12 percent of the population. There is, therefore, an increase of about 1 percent per dBA between an L_{dn} of 60-70 dBA. Between an L_{dn} of 70-80 dBA, each decibel increase increases by about 2 percent the percentage of the population highly annoyed. People appear to respond more adversely to aircraft noise. When the L_{dn} is 60 dBA, approximately 10 percent of the population is believed to be highly annoyed. Each decibel increase to 70 dBA adds about 2 percentage points to the number of people highly annoyed. Above 70 dBA, each decibel increase results in about a 3 percent increase in the percentage of the population highly annoyed.

ENVIRONMENTAL NOISE ASSESSMENT
RAMEY WINERY PROJECT
7097 WESTSIDE ROAD
SONOMA COUNTY, CALIFORNIA

October 9, 2013
Revised September 4, 2015

Job No. 13-155

INTRODUCTION

This noise assessment evaluates the existing noise environment and the potential for increased noise as a result of the proposed Ramey Wine Cellars Project (Project) on a parcel located at 7097 Westside Road near the City of Healdsburg in an unincorporated area of Sonoma County. Figure 1 shows a site map of the property. The proposed project includes production of 60,000 cases of wine, a tasting room, retail sales, and an area designated for trade-related special events. On the eastern side of Westside Road, the existing hop kiln will be converted into a public tasting room, and the existing hop barn will be converted into a private marketing space with a kitchen and two guest rooms. The two buildings will be connected by a bridge, which will also be constructed. On the western side the roadway, a new 60,000-case winery production facility with a cave area for wine barrel storage will be constructed. These facilities will not be open to the public except by invitation. Additionally, entryways, driveways, parking, walkways and site accessibility features are included in the project.

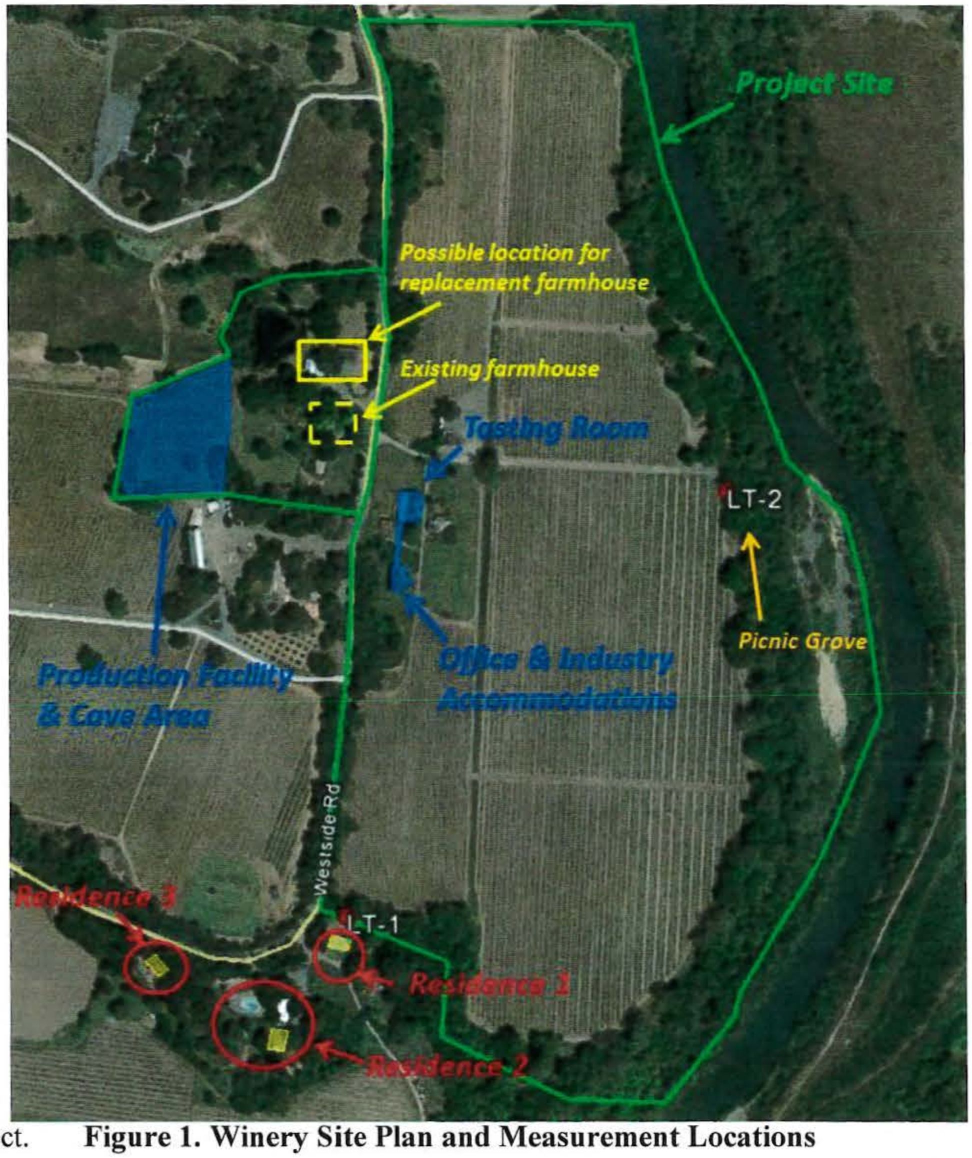

Figure 1. Winery Site Plan and Measurement Locations

The winery operations will include public tasting, retail sales, and trade-related special events. The staff will include fifteen employees between the winery and the tasting room. On average, 52 visitors per day are expected for tasting. The Project application includes provisions for 24 special events per year. These include 10 winemaker lunches or dinners with 30 persons in attendance, five 60-person private tastings, five 120-person private tastings, two 300-person new wine release tastings, and two 300-person industry-wide events. Table 1 summarizes each of the special events proposed at the winery and provides number of guests, locations for the events on the property, and the hours of each event.

The winery is situated on a 75-acre parcel of land formerly occupied by Westside Farms. The property is bordered to the north by Gracianna Winery, to the northwest by Arista Winery, to the west by Williams Selyem Winery, and to the south and east by the Russian River. On the opposite side of the river is Riverfront Regional Park. To the south of the property lie single-family residences, as well. This report includes a summary of applicable noise regulations, the results of a noise monitoring survey conducted for the Project, and an assessment of noise impacts and mitigation measures necessary to meet the applicable County standards at adjacent noise sensitive land uses. Persons not familiar with environmental noise analysis are referred to Appendix A for additional discussion.

Table 1: Ramey Wine Cellars Proposed Events

Event Type	No. of Events per Year	Hours	Maximum No. of Guests	Event Location on the Property
Industry-wide Event	Total of 2 event days per year	10:00 a.m. to 5:00 p.m.[a]	300	Tasting rooms, and outdoor area between tasting rooms, or walnut grove
New wine release tastings – by invitation only	2	9:00 a.m. to 9:00 p.m.	300	Tasting rooms, and outdoor area between tasting rooms, or walnut grove
Private tastings	5	9:00 a.m. to 9:00 p.m.	120	Tasting rooms, outdoor area between tasting rooms, and walnut grove
Private tastings	5	11:00 a.m. to 3:00 p.m. or 6:00 p.m. to 9:00 p.m.	60	Tasting rooms, outdoor area between tasting rooms, and walnut grove
Winemaker lunches or dinners with on-site food preparation, and food and wine pairings	10	11:00 a.m. to 3:00 p.m. or 6:00 p.m. to 9:00 p.m.	30	Baling barn, walnut grove, and winery

[a] Industry-wide events must occur during the public tasting room hours.

REGULATORY BACKGROUND

The Sonoma County Noise Element of the 2000 General Plan identifies a goal to:

> *Protect people from the adverse effects of exposure to excessive noise and to achieve an environment in which people and land uses function without impairment from noise.*

The following policies, which are applicable for use at the Project, are intended to achieve this goal:

NE-1c: Control non-transportation-related noise from new projects. The total noise level resulting from new sources shall not exceed the standards in Table NE-2 of the recommended revised policies as measured at the exterior property line of any adjacent noise-sensitive land use. Limit exceptions to the following:

1. If the ambient noise level exceeds the standard in Table NE-2, adjust the standard to equal the ambient level, up to a maximum of five dBA above the standard, provided that no measurable increase (i.e., +/- 1.5 dBA) shall be allowed.
2. Reduce the applicable standards in Table NE-2 by five dBA for simple tone noises, noises consisting primarily of speech or music, or for recurring impulsive noises, such as pile drivers and barking dogs at kennels.
3. Reduce the applicable standards in Table NE-2 by five dBA if the proposed use exceeds the ambient level by 10 dBA or more.
4. For short-term noise sources, which are permitted to operate no more than six days per year, such as concerts or race events, the allowable noise exposures shown in Table NE-2 may be increased by five dB. These events shall be subject to a noise management plan, including provisions for maximum noise level limits, noise monitoring, complaint response, and allowable hours of operation. The plan shall address potential cumulative noise impacts from all events in the area.
5. Noise levels may be measured at the location of the outdoor activity area of the noise-sensitive land use, rather than at the exterior property line of the adjacent noise-sensitive use, where:
    a. The property on which the noise-sensitive use is located has already been substantially developed pursuant to its existing zoning, and
    b. There is available open land on these noise-sensitive lands for noise attenuation.

    Note, this exception may not be used for vacant properties, which are zoned to all noise-sensitive uses.

Table 2. Maximum Allowable Noise Exposures for Non-Transportation Sources (Table NE-2)

Hourly Noise Metric[1]	Maximum Exterior Noise Level Standards, dBA	
	Daytime: 7:00 a.m. to 10:00 p.m.	Nighttime: 10:00 p.m. to 7:00 a.m.
L_{50} (30 minutes in any hour)	50	45
L_{25} (15 minutes in any hour)	55	50
L_{08} (5 minutes in any hour)	60	55
L_{02} (1 minute in any hour)	65	60

[1] The sound level exceeded n% of the time in any hour. For example, the L_{50} is the value exceeded 50% of the time or 30 minutes in any hour; this is the median noise level. The L_{02} is the sound level exceeded one minute in any hour.

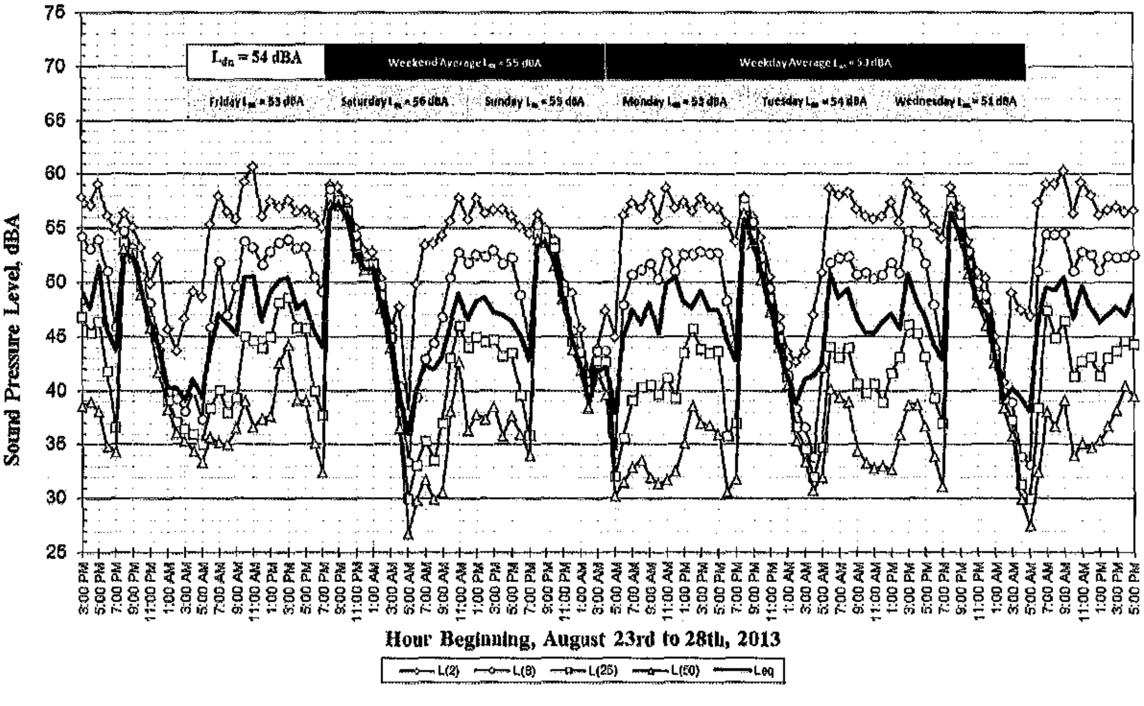
EXISTING NOISE ENVIRONMENT

AMBIENT NOISE LEVELS

The primary ambient source of noise in the project area is the traffic along Westside Road. Other contributors to noise include airplanes flying overhead and agricultural-related activities in the area. To evaluate ambient noise levels on the project site at the closest noise-sensitive land uses, an ambient noise monitoring survey, consisting of two long-term noise measurements, was conducted between 3:00 p.m. on Friday, August 23, 2013, and 5:00 p.m. on Wednesday, August 28, 2013. LT-1 was located on the southern end of the property, approximately 110 feet (34 meters) from the centerline of Westside Road. This location represents the neighboring single-family residences. LT-2 was located at the tree line on the eastern boundary of the project site. Positioned approximately 185 feet (56 meters) from the Russian River, this long-term measurement location captured ambient noise away from Westside Road, which is in the vicinity of Riverfront Regional Park. Figure 1 shows the approximate locations of both measurement sites.

The hourly trends in noise levels at LT-1 and LT-2 are shown in Figures 2 and 3, respectively. Included in each figure are the energy equivalent noise level, L_{eq}, and the statistical noise levels consistent with the limits set forth in Table NE-2 (noise levels exceeded 2, 8, 25, and 50 percent of the time).

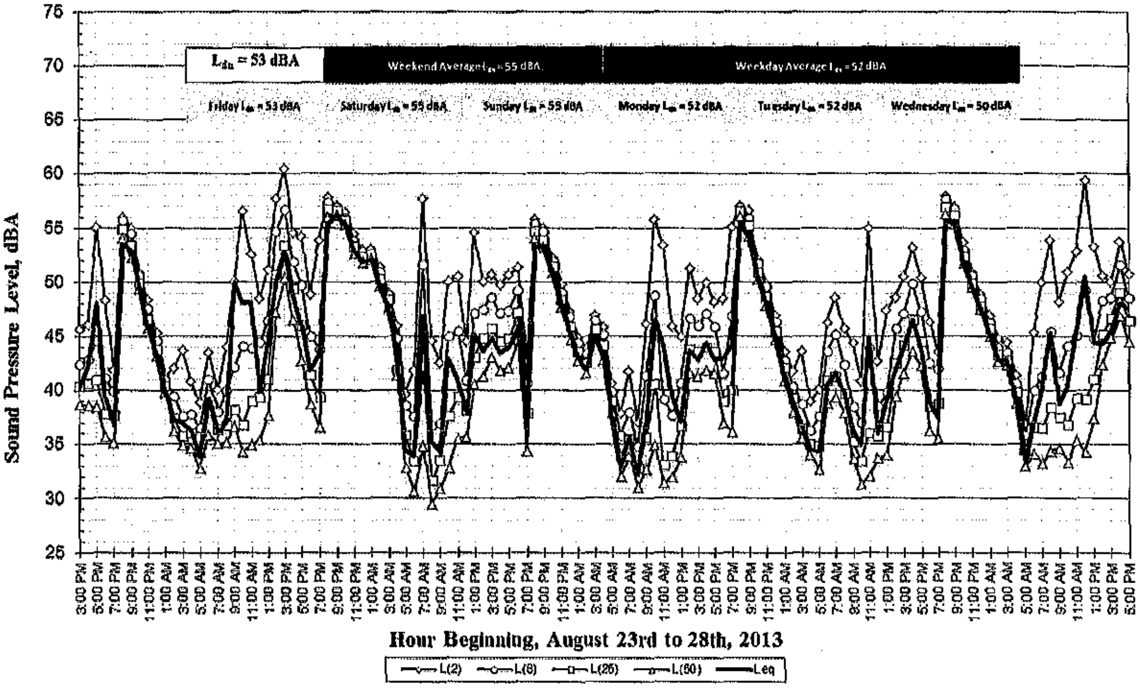
Figure 2. Measured Noise Levels at LT-1



From Figure 2, the daytime L_{eq} for the weekend (i.e., Saturday and Sunday) at LT-1 ranged from 42 to 57 dBA, with an average L_{eq} of 50 dBA. The nighttime L_{eq} for the weekend at LT-1 ranged from 36 to 56 dBA, with an average L_{eq} of 49 dBA. During the weekdays (i.e., Friday, Monday, Tuesday, and Wednesday), the average daytime and nighttime averages for L_{eq} ranged from 43 to 56 dBA, with an average of 50 dBA, and from 38 to 51 dBA, with an average of 46 dBA, respectively. The day-night average noise level, which is the L_{dn}, at LT-1 measured to be 55 dBA on the weekend and 53 dBA on the weekday. The overall L_{dn} for the entire testing period was 54 dBA. The chart in Figure 2 shows the average L_{dn} for each day of testing. The daytime and nighttime noise descriptors used to interpret the County's Noise Performance Standards at LT-1 for the measurement period are shown in Table 3.

For LT-2, which is shown in Figure 3, the average L_{eq} measurements from the weekend ranged from 34 to 56 dBA in the daytime, with an average of 49 dBA, and from 34 to 55 dBA in the nighttime, with an average of 48 dBA. On the weekdays, the average L_{eq} in the daytime ranged from 32 to 56 dBA, with an average of 48 dBA. In the nighttime, the average weekday L_{eq} ranged from 33 to 52 dBA, with an average of 45 dBA. The average weekend L_{dn} was 55 dBA, and on the weekday, the L_{dn} was approximately 52 dBA. The overall L_{dn} for the entire testing period at LT-2 was 53 dBA. The calculated L_{dn} for each day of testing is shown in Figure 3. The Noise Performance Standards at LT-2 are summarized in Table 3.

Figure 3. Measured Noise Levels at LT-2



In comparing the hourly noise levels for each long-term measurement location, notice that the median noise levels, L_{50}, during the nighttime hours of 10:00 p.m. to 7:00 a.m. drop well-below 30 dBA on two different occasions near the roadway at LT-1 but barely drop as low as 30 dBA at LT-2 during the same period of time. This higher nighttime ambient noise further from the roadway is likely due to nighttime woodland insect noise.

Based on the results from LT-1 and LT-2, the L_{dn} levels measured on the weekend were approximately 2 to 3 dBA higher than on the weekdays. The weekend L_{eq} levels in the daytime were approximately 0 to 1 dBA higher than the weekdays, and in the nighttime, the weekend L_{eq} levels averaged to be approximately 3 dBA higher than on the weekdays. Since winery-related noise generally occurs at the same or higher rates on the weekends, ambient noise from the weekends will be used to conduct the impact assessment for the worst-case scenario.

Table 3: Measured Ambient Noise Levels

Hourly Noise Metric	**Exterior Ambient Noise Levels**			
	LT-1 (southern property line near Westside Road Noise)		**LT-2 (eastern property line away from Westside Road Noise)**	
	Avg. Daytime Level (Range)	**Avg. Nighttime Level** (Range)	**Avg. Daytime Level** (Range)	**Avg. Nighttime Level** (Range)
L_{50} (30 Min.)	**48** (34 to 58)	**47** (30 to 57)	**48** (32 to 57)	**47** (34 to 56)
L_{25} (15 Min.)	**52** (41 to 58)	**48** (33 to 57)	**49** (35 to 58)	**48** (36 to 56)
L_{08} (5 Min.)	**53** (43 to 59)	**48** (33 to 57)	**50** (35 to 58)	**48** (36 to 56)
L_{02} (1 Min.)	**57** (53 to 61)	**51** (38 to 59)	**53** (37 to 61)	**49** (37 to 56)

NOISE ASSESSMENT

Estimating the expected noise produced by, and impacts from, the proposed project at adjacent noise-sensitive uses requires three elements: 1) identification of what noise-producing operations are likely to occur; 2) the typical noise source levels for those operations; and 3) the temporal nature of the operations.

I. Identification of Noise-Producing Operations/Uses

There are a number of operations associated with wine production and events at the proposed facility that will produce noise. These include:

1. Project traffic;
2. Winery and seasonal production operations;
3. Maintenance and forklift operations; and
4. Special event noise.

II. Typical Noise Source Levels

To estimate the noise levels associated with project operations, some attention must be given to the temporal nature of the noise produced. Below each of the major winery-related noise-producing operations outlined above are discussed:

1. *Project Traffic* would produce the following type and range of traffic noise levels:
   a. Automobile and light-vehicle traffic accessing the tasting room would occur during the daytime hours, and noise produced is expected to include the sounds of vehicles accessing parking areas, engine starts, door slams, etc. These noises typically range from a maximum of 53 to 63 dBA at 50 feet (15 meters).
   b. The majority of truck traffic on the project site is expected to primarily access the winery building on the western side of Westside Road, though some truck traffic may also access other portions of the site. Noise levels generated by truck traffic are dependent on the size and speed of trucks; typically, maximum noise levels generated by heavy-duty (i.e., semi-tractor trailer type) trucks would range from 70 dBA when traveling at constant speeds to 75 dBA when stopping/starting and maneuvering at a distance of 50 feet (15 meters). Medium (box type and delivery) trucks would typically have maximum levels ranging

from 60 dBA when traveling at constant speeds to 65 dBA when stopping/starting and maneuvering at a distance of 50 feet.

2. *Winery and Seasonal Production Operations* would produce the following type and range of noise levels:
   a. Refrigeration equipment, as a maximum condition, is assumed to operate under constant conditions during the day and night. Though the model, type, and capacities of the cooling compressors for the facility are not specified, field measurements of such equipment show that sound levels from such equipment can produce levels between 50 and 65 dBA at 50 feet, with L_{50} noise levels of 60 dBA at 50 feet.
   b. Air compressors used for various processes in the facility typically cycle on and off based on the need for compressed air. Though the model, type, and capacities of the cooling compressors for the facility are not specified, we can estimate results based on field measurements of cooling compressors at other wineries. The equipment is expected to produce L_{50} sound levels of 62 dBA at 50 feet.
   c. Bottling would be constant on an hourly basis, although it is likely to occur for only a few weeks each year. Based on sound level measurements of bottling lines at other wineries, bottling operations can be expected to produce L_{50} sound levels between 65 and 70 dBA at 50 feet.
   d. Crush activities at medium to large-sized wineries typically occur for approximately two months each year. The majority of the noise sources associated with the crush include the operation of hoppers, presses, de-stemmers, separators, crushers, air compressors, forklifts, conveyors, etc. Average noise levels resulting from the crush are typically constant on an hourly basis. Individual pieces of crush-specific equipment, such as the separators and de-stemmers, are relatively quiet with sound levels around 50 dBA L_{eq} at approximately 50 feet. The composite crush activities at a large sized winery, such as a 60,000-case capacity facility, typically generate noise levels of approximately 66 dBA L_{eq} at a distance of 50 feet from the center of operations. During the crush, discrete maximum noise events, such as the setting of empty bins, may reach 70 to 80 dBA L_{max} or L_{02} at 50 feet from the center of operations.

3. *Maintenance and Forklift Operations* would produce intermittent noise depending upon the exact nature of the operation. These would likely occur at a much slower than a daily rate; although operations may span several hours, once initiated. Backup alarms (or beepers), which are repetitive and irritating by design, would also produce noise during these activities, and as with forklift operations, are expected to be intermittent by nature. Forklift use and associated backup alarm noise would be partially attenuated during crush-related activities by structure of the production building. Based on experience with other winery operations, it can be estimated that non-attenuated L_{08} noise levels from these operations may reach levels of 66 to 67 dBA at 50 feet.

4. *Special Events Noise,* such as concerts and weddings are not planned, nor requested, at the winery. The winery does plan to participate in industry-related events, averaging approximately 24 per year, which are summarized above in Table 1. The baling barn will be located across the street from the production facilities. Table 4, following, summarizes typical noise levels generated by small-to-moderate sized events at distances of 50 feet from the source which have been developed from measurements conducted by Illingworth & Rodkin at actual wedding and non-concert celebration/party events in the Northbay and

throughout the Bay Area[1]. The proposed project would not include amplified music or amplified speech at outdoor events.

In addition to the use of these vetted Event Source Levels, the project applicant has been asked by County Staff to evaluate amplified music events against a peak[2] L_{50} level for musical instruments of 88 dBA at 40 feet. We would note though actual peak (e.g. maximum) levels for musical instruments may reach this level, average sound levels would likely result in uncomfortably high sound levels for winery visitor (100 dBA at 10 feet from the music source). However, in keeping with the County's request, and to conduct an extremely conservative analysis of the impact of the amplified music at winery events, the L_{50} levels for amplified musical instruments of 88 dBA at 40 feet has been used in this analysis.

Table 4: Typical Noise Source Levels for Promotional Events (A-Weighted L_{50} Levels)

Event or Activity	Typical Noise Level @ 50 ft
Amplified Music[b]	72 dBA
Amplified Speech	71 dBA
Non-amplified (acoustic) Music	67 dBA
Films – Voices/Music	64 dBA
Raised Conversation	65 dBA

[b]Amplified concert-type music events are not proposed – such events would increase L_{50} noise levels to 80 dBA at 50 feet.

III. Propagation of sound

The final step in estimating the project noise levels is assessing the propagation of sound to the sensitive receptors. To do this, it is necessary to assume some rate of sound attenuation between the operations and receiver locations. The most dominant physical effect is due to the spreading out of sound waves with distance. For simple, single sources, such as fixed equipment and stationary truck operations, the divergence of the sound wave is hemispherical in nature, producing a reduction of 6 dB with each doubling of distance. For moving sources of noise, such as automobile traffic or truck movements, which are considered linear sources of noise, the divergence of the sound wave is cylindrical in nature, producing a reduction of 3 to 4 ½ dB with each doubling of distance. Other effects can modify these fall-off rates, such as partial shielding from buildings or topography, atmospheric attenuation of sound, ground absorption, and meteorological effects. These effects almost always reduce the noise, in addition to that due to sound divergence. As most of these effects will vary with time due to changing environmental conditions, it is most conservative to assume only attenuation due to divergence for outdoor activities and conservative (minimal) rate of structural attenuation (12 dBA) when operations are conducted within buildings, realizing that the actual noise level will be at or, most likely, below those predicted using this assumption at any one time.

---

[1] These source levels have been used to analyze amplified music at non-concert type special events at over 30 winery projects since the current Sonoma County General Plan (2020) was adopted and have been also adopted by the Sonoma County Winery Event Working Group as typical noise levels for winery event activities.

[2] The use of the term "peak" in describing an L_{50} level has been reported from the source used by County Staff; however, we would note that such a term appears to be an oxymoron since the statistically based L_{50} (or median level) is by definition an average and not a peak level.

To evaluate noise impacts on area noise sensitive uses, noise levels were propagated to three representative residences. There is also an existing farmhouse on the project site to the west of Westside Road. This residence is to be demolished, and therefore, does not require noise propagation calculations. Noise propagation calculations were completed on the following residences (see Figure 1 for locations):

1. *Residence 1*: This residence is located in the vicinity of LT-1. It is south of the project site on the same side of Westside Road as the tasting room and public and private tasting rooms and therefore on the opposite side as the wine production building. The residence is approximately 75 feet (23 meters) from the centerline of Westside Road. The front yard of this home is represented by the calculated noise levels for monitoring position LT-1.
2. *Residence 2*: This residence is also located to the south of the project site. Residence 2 is also south of Residence 1 and slightly west. Since Westside Road turns westward just south of Residence 1, the alignment of Residence 2 is such that it is located directly south of the wine production building. This property includes an outdoor pool area that is approximately 100 to 170 feet (30 to 52 meters) from the centerline of Westside Road. The front yard of the home ranges from 52 to 180 feet (16 to 55 meters) from the centerline of the roadway, and the front façade of the home is 190 to 215 feet (58 to 66 meters) from the roadway centerline. Due to the proximity of the home to LT-1, the calculated noise levels at this monitoring location are represented by LT-1 minus 3 dBA.
3. *Residence 3*: While on the same side of Westside Road as Residences 1 and 2, the geometry of the roadway is such that Residence 3 is southwest of the wine production building. Positioned approximately 50 to 75 feet (15 to 23 meters) from the centerline of Westside Road, this home is also best represented by LT-1 plus 3 dBA.

Ambient noise levels at these residences under worst case (i.e., weekend) conditions were calculated using the sound level differences noted above and the measurement results shown in Table 3 for the long-term noise measurement, LT-1. Table 5 summarizes the calculated levels for all four residences.

Table 5: Calculated Ambient Noise Levels at Adjacent Noise-Sensitive Uses

Hourly Noise Metric	Exterior Ambient Noise Levels, dBA					
	Residence 1		Residence 2		Residence 3	
	Avg. Daytime Level	Avg. Nighttime Level	Avg. Daytime Level	Avg. Nighttime Level	Avg. Daytime Level	Avg. Nighttime Level
L_{50} (30 min.)	48	47	45	44	51	50
L_{25} (15 min.)	52	48	49	45	55	51
L_{08} (5 min.)	53	48	50	45	56	51
L_{02} (1 min.)	57	51	54	48	60	54

IMPACT ASSESSMENT

Impact 1: Traffic, Parking Lot and Truck Noise

Automobile parking and traffic

On the east side Westside Road where the tasting room and office and industry accommodations are located, the existing driveways and parking areas will be used. The parking lot will be enhanced, but the general location will remain the same. Residence 1 (represented by LT-1 at the southern boundary of the winery property) is approximately 960 feet from the nearest parking area; Residences 2 (located further south of LT-1 along Westside Road) and 3 (located to the west of LT-1, also along Westside Road) are approximately 1,220 and 1,210 feet, respectively, from the nearest parking area. Based on these distances, noise generated by automobile and light vehicles would be between 28 and 38 dBA at Residence 1 and between 25 and 35 dBA at both Residences 2 and 3. Given the expected visitor and employee use, these activities are expected to occur for less than five minutes out of an hour on a typical day and fall in the L_{02} NE-2 daytime category of 65 dBA (see Table 2). However, during events or on busy weekends, such activities may occur more frequently and fall in the L_{08} NE-2 daytime category of 60 dBA. The ambient noise environment in this area is described by measurements at site LT-1. Table 6 summarizes the assessment of automobile noise in driveways and in parking lots.

Table 6: Driveway and Parking Lot Automobile L_{08} Noise Levels

	L_{08} (Noise Level Exceeded 5 minutes in Any Hour), dBA		
	Residence 1	**Residence 2**	**Residence 3**
Unadjusted Table NE-2 Daytime Limit	60	60	60
Daytime Ambient Noise Levels	53	50	56
Ambient Exceeds NE-2 Limit	No	No	No
NE-2 Adjustment	+0	+0	+0
Driveway/Parking Lot Noise at Receiver	**28 to 38**	**25 to 35**	**25 to 35**
Operations Exceed Ambient by 10 dBA?	No	No	No
NE-2 Adjustment	+0	+0	+0
Adjusted Table NE-2 Daytime Limit	60	60	60
Driveway/Parking Noise Exceeds NE-2?	No	No	No

Based on this finding, noise levels associated with automobiles and light vehicles using the project driveways and parking lots would not exceed the daytime NE-2 noise standards at the nearest residences.

Truck traffic

Trucks visiting the winery site will use the new driveway to access the wine production facility on the west side of the roadway. This main winery access path will take constant speed and maneuvering trucks within respective distances of approximately 1,170 to 1,335 feet of Residence 1, 1,290 to 1,595 feet of Residence 2, and 1,200 to 1,515 feet of Residence 3. Using these distances, noise generated by heavy-duty trucks may range from 48 to 56 dBA at Residence 1 and from 47 to 55 dBA at both Residences 2 and 3. The noise generated by medium-duty trucks ranged from 38 to 46 dBA at Residence 1 and from 37 to 45 dBA at Residences 2 and 3. Truck operations are expected to occur during daytime hours only and on a basis of one to five minutes per hour, or less, since it is unlikely that more than one heavy truck would arrive and depart during any given hour. Thus, truck operations would fall in the L_{02} NE-2 category of 65 dBA (see Table 2) at the adjacent residential uses. Table 7, below, presents and summarizes the assessment of truck traffic noise.

Table 7: Truck L_{02} Noise Levels

	L_{02} (Noise Level Exceeded 1 minute in Any Hour), dBA		
	Residence 1	**Residence 2**	**Residence 3**
Unadjusted Table NE-2 Daytime Limit	65	65	65
Daytime Ambient Noise Levels	57	54	60
Ambient Exceeds NE-2 Limit	No	No	No
NE-2 Adjustment	+0	+0	+0
Heavy Truck Operations at Receiver	**48 to 56**	**47 to 55**	**47 to 55**
Medium Truck Operations at Receiver	**38 to 46**	**37 to 45**	**37 to 45**
Operations Exceed Ambient by 10 dBA?	No	No	No
NE-2 Adjustment	+0	+0	+0
Adjusted Table NE-2 Daytime Limit	65	65	65
Truck Traffic Noise Exceeds NE-2?	No	No	No

Based on these findings, noise associated with truck traffic at the project is not expected to exceed daytime NE-2 noise standards at the nearest residences.

Mitigation 1: None Needed

Impact 2: Mechanical Equipment Noise

The project would likely include noise-generating mechanical equipment, such as air-cooled condensing units, pumps, and compressors, at the wine production facility, as well as less-significant sources of noise, such as air-conditioning systems and exhaust fans. The project description and drawings do not indicate the location of such equipment. This equipment may be located within the structures or positioned so that the structures provide shielding for noise caused by the equipment. However, considering a worst-case scenario where the equipment is placed outside of production buildings and not shielded from the adjacent residences, the equipment may be located as close as 1,210 feet from Residence 1, as 1,300 feet from Residence 2, and as close as 1,170 feet from Residence 3.

Using the source levels discussed above and a 6 dB sound reduction for each doubling of the distance between the noise source and the receivers, constant L_{50} noise levels from mechanical equipment may be between an L_{50} of 32 and 34 dBA at Residences 1 and 2 and between an L_{50} of 33 and 35 dBA at Residence 3. Table 8, following, summarizes the assessment of mechanical equipment noise.

Based on these findings, noise associated with mechanical equipment is not expected to exceed daytime or nighttime NE-2 noise standard at the nearest residences.

Mitigation 2: None Needed

Adjusted Table NE-2 Nighttime Limit	47	45	50
Mechanical Equipment Noise Exceeds NE-2?	No (day & night)	No (day & night)	No (day & night)

Impact 3: Crush-Related Noise

Annual crush-related activities would take place within the new wine production building. The crush pad & press equipment room will be located on the first floor and on the western side of the building, which indicates considerable shielding of crush-related noise by the building itself from the nearby residences. Based on the Winery Floor Plans provided, the space above the crush pad will be open to the second floor, but it is unclear if the area will be open or closed to nature. Assuming the worst case scenario, crush-related activities will be considered to occur outdoors. From the plans for the project site and the building plans, the future location of the crush pad was estimated, and using Google Earth, the distances to the each residence was approximated. The crush pad will be within 1,280 feet of Residence 1, within 1,400 feet of Residence 2 and within 1,275 feet of Residence 3. Using the source levels discussed above and a 6 dB sound reduction for each doubling of the distance, constant L_{50} noise levels from crush-related activities would be approximately 38 dBA at Residence 1, 37 dBA at Residence 2, and 38 dBA at Residence 3. Table 9, below, summarizes these calculations. The maximum noise events discussed above, such as bin drops, etc., would be an L_{02} of 42 to 52 dBA at Residence 1, 41 to 51 dBA at Residence 2, and 42 to 52 dBA at Residence 3. Table 10 summarizes the maximum noise events assessment of crush-related activities.

Table 9: Crush-Related L_{50} Noise Levels

Adjusted Table NE-2 Nighttime Limit	60	60	60
Crush-Related Noise Exceeds NE-2?	No (day & night)	No (day & night)	No (day & night)

Based on the findings shown, noise associated with crush related noise is not expected to exceed daytime or nighttime NE-2 noise standard at the nearest residences.

Mitigation 3: None Needed

Impact 4: Bottling Noise

According to the building floor plans provided, bottling will be done in the production facility area, next to the truck access loading zone. The building will provide shielding from noise created during bottling activities. The distances from the bottling area to the nearby residences are as follows: 1,225 feet from Residence 1, 1,345 feet from Residence 2, and 1,200 feet from Residence 3. Based on these distances and the noise shielding, noise from bottling activities are expected to be an L_{50} of 37 to 42 dBA at Residence 1, an L_{50} of 36 to 41 dBA at Residence 2, and an L_{50} of 37 to 42 dBA at Residence 3. Table 11 summarizes the assessment of bottling noise.

Table 11: Bottling L_{50} Noise Levels

	L_{50} (Noise Level Exceeded 30 minutes in Any Hour), dBA		
	Residence 1	**Residence 2**	**Residence 3**
Unadjusted Table NE-2 Daytime Limit	50	50	50
Daytime Ambient Noise Levels	48	45	51
Daytime Ambient Exceeds NE-2 Limit?	No	No	**Yes**
Daytime NE-2 Adjustment	+0	+0	+1

Adjusted Table NE-2 Daytime Limit	50	50	51
Adjusted Table NE-2 Nighttime Limit	47	45	50
Bottling Noise Exceeds NE-2?	No (day & night)	No (day & night)	No (day & night)

Based on these findings, noise associated with bottling is not expected to exceed daytime or nighttime NE-2 noise standard at any of the adjacent residences.

Mitigation 4: None Needed

Impact 5: Maintenance and Forklift Operations

Forklift and maintenance operations would likely take place on the first floor inside the new winery building, in the outdoor crushing and receiving areas, and possibly in the winery caves. Such activities within the winery building would receive significant noise shielding from the building and are not analyzed here. The crushing area would also receive considerable shielding from the building. Outdoor forklift and maintenance operations are considered a worst-case condition and are analyzed. Based on a review of project drawings, the outdoor area closest to the adjacent residences would be the receiving area/truck access, which was mentioned above as being within 1,335 feet of Residence 1, within 1,595 feet of Residence 2, and within 1,515 feet of Residence 3. Using the source levels discussed above and a 6 dB sound reduction for each doubling of the distance between the noise source and the receivers, noise from forklift and maintenance operations activities are expected to be an L_{08} of between 37 and 38 dBA at Residence 1 and an L_{08} of between 36 and 37 dBA at Residences 2 and 3. Table 12, following, summarizes the assessment of noise due to forklift and maintenance operations. Note, forklift and maintenance operations will only occur during the daytime hours.

Table 12: Forklift and Maintenance L_{08} Noise Levels

	L_{08} (Noise Level Exceeded 5 minutes in Any Hour), dBA		
	Residence 1	**Residence 2**	**Residence 3**
Unadjusted Table NE-2 Daytime Limit	60	60	60

Operations Exceed Ambient by 10 dBA?	No	No	No
NE-2 Adjustment	+0	+0	+0
Adjusted Table NE-2 Daytime Limit	60	60	60
Forklift/Maintenance Operations Noise Exceed NE-2?	No	No	No

Based on the findings shown in Table 12, noise associated with forklift and maintenance operations is not expected to exceed daytime NE-2 noise standard at the nearest residences.

Mitigation 5: None Needed

Impact 6: Event Noise at adjacent residential uses

Special events, such as concerts and weddings, are not planned, nor requested at the winery; however, the winery does plan to participate in county-wide industry events. The project application includes provisions for 24 special events per year, including 10 winemaker lunches or dinners with 30 persons in attendance, five 60-person private tastings, five 120-person private tastings, two 300-person new wine release tastings, and two 300-person industry-wide events. For an event consisting of 300 persons, a staff of approximately 14 people is expected. Table 1 provides locations and hours of these events. It should be noted that amplified music and amplified speech are not proposed at any outdoor events.

A review of the project site plans indicates that outdoor events may be held either on the east side of Westside Road in the vicinity of the tasting room and barn or in the picnic grove area located along the eastern boundary of the property near LT-2. Indoor events would be held inside the tasting room or barn. The production facility on the west side of the roadway will only be opened to guests by invitation only. Based on a review of building plans and elevations, events occurring within the winery buildings would receive noise shielding from the building structures estimated at 12 dBA with open windows and/or doors, and a minimum of 22 dBA with closed non-sound rated windows and/or doors. However, the outdoor events held in the garden area or yard between the tasting room/barn and Westside Road, in the yard south of the barn, in the yard east of the barn, or in the picnic grove area would receive little to no noise attenuation from intervening terrain or building structures at Residences 1, 2, and 3. The outdoor area between the tasting room and the barn would have some shielding from the barn structure.

Based on a review of aerial photos and the project site plan, distance information obtained using Google Earth indicates that outdoor events that take place around the tasting room and baling barn could be situated as close as 690 feet from Residence 1, 900 feet from Residence 2, and 915 feet from Residence 3. The outdoor events taking place in the picnic grove area would be approximately 1,525 feet from Residence 1, 1,775 feet from Residence 2, and 1,900 feet from Residence 3. The event space and guest rooms located in the barn are the closest indoor rooms for events. From the maps, indoor events at these locations would be as close as 885 feet from Residence 1, 1,100 feet from Residence 2, and 1,110 feet from Residence 3. Using these distances and the noise shielding considerations for outdoor and indoor events, the L_{50} sound levels for the typical noise source levels listed in Table 4 (and the County requested *peak* L_{50} level for musical instruments of 88 dBA at 40 feet) for outdoor and indoor events have been calculated at Residences 1, 2, and 3. Tables 13 and 14 summarize the assessments for outdoor special events noise around the winery and in the picnic grove area, respectively. Since amplified music and speech are not proposed at these outdoor events, they are not shown in Tables 13 and 14. Table 15 summarizes the assessment for the indoor special events noise. Since Table 1 indicates that special events would not occur during nighttime hours (10:00 p.m. to 7:00 a.m.), the County's nighttime limits shown in Table NE-2 would not be applicable to the proposed project and are not shown in Tables 13 through 15.

Table 13: Outdoor Special Events L_{50} Noise Levels in the Vicinity of the Winery

Non-Amplified Music Exceeds Adjusted NE-2?	No	No	No
Films – Voices/Music Exceeds Adjusted NE-2?	No	No	No
Raised Conversation Exceeds Adjusted NE-2?	No	No	No

Notes: 1. Amplified Music levels have been evaluated using a *peak* L_{50} level for musical instruments of 88 dBA at 40 feet as requested by County Staff. The use of these levels results in sound levels 14 dBA higher than those which have been adopted by the Sonoma County Winery Event Working Group and have been used by I&R to analyze amplified music at non-concert type winery events since the adoption of the current (2020) County General Plan. (see discussion on page 7).

Based on the findings shown in Table 15 indoor events with amplified music would exceed the County daytime and nighttime NE-2 standards at all of the three adjacent residences by between 1 to 2 dBA during daytime hours. However, the findings shown in Table 15 indicate that indoor events with amplified speech, non-amplified music, films, or raised conversations would not exceed the County daytime NE-2 standards at any of the adjacent residences.

In terms of exceedances of the County Standards, the above findings for outdoor and indoor events show that amplified music at events within buildings with open windows would exceed the daytime County NE-2 standard at Residences 1, 2 and 3.

Mitigation 6: Special/Promotional Events

Since even noise has the potential to result in levels exceeding the standard fairly significantly, the following measures should be included in the project:

1. Amplified music at events should only occur within the baling barn or tasting room buildings with closed windows and doors.
2. With closed windows and doors, indoor events with amplified speech or music may occur during daytime hours.

APPENDIX A:
FUNDAMENTAL CONCEPTS OF ENVIRONMENTAL ACOUSTICS

Noise may be defined as unwanted sound. Noise is usually objectionable because it is disturbing or annoying. The objectionable nature of sound may be caused by either its *pitch* or its loudness. *Pitch* is the height or depth of a tone or sound, depending on the relative rapidity (frequency) of the vibrations by which it is produced. Higher pitched signals sound louder to humans than sounds with a lower pitch. *Loudness* is intensity of sound waves combined with the reception characteristics of the ear. Intensity may be compared with the height of an ocean wave in that it is a measure of the amplitude of the sound wave.

In addition to the concepts of pitch and loudness, there are several noise measurement scales that are used to describe noise in a particular location. *A decibel (dB)* is a unit of measurement that indicates the relative amplitude of a sound. The zero on the decibel scale is based on the lowest sound level that the healthy, unimpaired human ear can detect. Sound levels in decibels are calculated on a logarithmic basis. An increase of 10 decibels represents a ten-fold increase in acoustic energy, while 20 decibels is 100 times more intense, 30 decibels is 1,000 times more intense, etc. There is a relationship between the subjective noisiness or loudness of a sound and its intensity. Each 10-decibel increase in sound level is perceived as approximately a doubling of loudness over a fairly wide range of intensities. Technical terms are defined in Table A1. There are several methods of characterizing sound. The most common in California is the *A-weighted sound level or dBA*. This scale gives greater weight to the frequencies of sound to which the human ear is most sensitive. Representative outdoor and indoor noise levels in units of dBA are shown in Table A2.

Because sound levels can vary markedly over a short period of time, a method for describing either the average character of the sound or the statistical behavior of the variations must be utilized. Most commonly, environmental sounds are described in terms of an average level that has the same acoustical energy as the summation of all the time-varying events. This energy-equivalent sound/noise descriptor is called L_{eq}. The most common averaging period is hourly, but L_{eq} can describe any series of noise events of arbitrary duration.

The scientific instrument used to measure noise is the sound level meter. Sound level meters can accurately measure environmental noise levels to within about plus or minus 1 dBA. Various computer models are used to predict environmental noise levels from sources, such as roadways and airports. The accuracy of the predicted models depends upon the distance the receptor is from the noise source. Close to the noise source, the models are accurate to within about plus or minus 1 to 2 dBA.

TERM	DEFINITIONS
Decibel, dB	A unit describing the amplitude of sound, equal to 20 times the logarithm to the base 10 of the ratio of the pressure of the sound measured to the reference pressure, which is 20 micropascals (20 micronewtons per square meter).
Frequency, Hz	The number of complete pressure fluctuations per second above and below atmospheric pressure.
A-Weighted Sound Level, dBA	The sound pressure level in decibels as measured on a sound level meter using the A-weighting filter network. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear and correlates well with subjective reactions to noise. All sound levels in this report are A-weighted, unless reported otherwise.
L_{01}, L_{10}, L_{50}, L_{90}	The A-weighted noise levels that are exceeded 1%, 10%, 50%, and 90% of the time during the measurement period.
Equivalent Noise Level, L_{eq}	The average A-weighted noise level during the measurement period.
Day/Night Noise Level, L_{dn}	The average A-weighted noise level during a 24-hour day, obtained after addition of 10 decibels to levels measured in the night between 10:00 pm and 7:00 am.
L_{max}, L_{min}	The maximum and minimum A-weighted noise level during the measurement period.
Ambient Noise Level	The composite of noise from all sources near and far. The normal or existing level of environmental noise at a given location.
Intrusive	That noise which intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of a sound depends upon its amplitude, duration, frequency, and time of occurrence and tonal or informational content as well as the prevailing ambient noise level.

Definitions Of Acoustical Terms **Table A1**

ILLINGWORTH & RODKIN, INC./Acoustical Engineers

Since the sensitivity to noise increases during the evening and at night -- because excessive noise interferes with the ability to sleep -- 24-hour descriptors have been developed that incorporate artificial noise penalties added to quiet-time noise events. The *Day/Night Average Sound Level, Ldn,* is a measure of the cumulative noise exposure in a community, with a 10 dB penalty added to nighttime (10:00 pm - 7:00 am) noise levels.

At a Given Distance From Noise Source	A-Weighted Sound Level in Decibels	Noise Environments	Subjective Impression
	140		
Civil Defense Siren (100')	130		
Jet Takeoff (200')	120		Pain Threshold
	110	Rock Music Concert	
Diesel Pile Driver (100')	100		Very Loud
	90	Boiler Room	
Freight Cars (50')		Printing Press Plant	
Pneumatic Drill (50')	80		
Freeway (100')			
Vacuum Cleaner (10')	70	In Kitchen With Garbage Disposal Running	Moderately Loud
	60	Data Processing Center	
Light Traffic (100')	50	Department Store	
Large Transformer (200')			
	40	Private Business Office	Quiet
Soft Whisper (5')	30	Quiet Bedroom	
	20	Recording Studio	
	10		Threshold of Hearing
	0		

Typical Sound Levels Measured In The Environment And Industry

Table A2

ILLINGWORTH & RODKIN, INC./Acoustical Engineers

Effects of Noise

Sleep and Speech Interference: The thresholds for speech interference indoors are about 45 dBA if the noise is steady and above 55 dBA if the noise is fluctuating. Outdoors the thresholds are about 15 dBA higher. Steady noise of sufficient intensity; above 35 dBA, and fluctuating noise levels above about 45 dBA have been shown to affect sleep. Interior residential standards for multi-family dwellings are set by the State of California at 45 dBA L_{dn}. Typically, the highest steady traffic noise level during the daytime is

about equal to the L_{dn} and nighttime levels are 10 dBA lower. The standard is designed for sleep and speech protection and most jurisdictions apply the same criterion for all residential uses. Typical structural attenuation is 12-17 dBA with open windows. With closed windows in good condition, the noise attenuation factor is around 20 dBA for an older structure and 25 dBA for a newer dwelling. Sleep and speech interference is therefore possible when exterior noise levels are about 57-62 dBA L_{dn} with open windows and 65-70 dBA L_{dn} if the windows are closed. Levels of 55-60 dBA are common along collector streets and secondary arterials, while 65-70 dBA is a typical value for a primary/major arterial. Levels of 75-80 dBA are normal noise levels at the first row of development outside a freeway right-of-way. In order to achieve an acceptable interior noise environment, bedrooms facing secondary roadways need to be able to have their windows closed, those facing major roadways and freeways typically need special glass windows.

Annoyance: Attitude surveys are used for measuring the annoyance felt in a community for noises intruding into homes or affecting outdoor activity areas. In these surveys, it was determined that the causes for annoyance include interference with speech, radio and television, house vibrations, and interference with sleep and rest. The L_{dn} as a measure of noise has been found to provide a valid correlation of noise level and the percentage of people annoyed. People have been asked to judge the annoyance caused by aircraft noise and ground transportation noise. There continues to be disagreement about the relative annoyance of these different sources. When measuring the percentage of the population highly annoyed, the threshold for ground vehicle noise is about 55 dBA L_{dn}. At an L_{dn} of about 60 dBA, approximately 2 percent of the population is highly annoyed. When the L_{dn} increases to 70 dBA, the percentage of the population highly annoyed increases to about 12 percent of the population. There is, therefore, an increase of about 1 percent per dBA between an L_{dn} of 60-70 dBA. Between an L_{dn} of 70-80 dBA, each decibel increase increases by about 2 percent the percentage of the population highly annoyed. People appear to respond more adversely to aircraft noise. When the L_{dn} is 60 dBA, approximately 10 percent of the population is believed to be highly annoyed. Each decibel increase to 70 dBA adds about 2 percentage points to the number of people highly annoyed. Above 70 dBA, each decibel increase results in about a 3 percent increase in the percentage of the population highly annoyed.

Subject: Ramey Winery Project, Sonoma County, CA
Addendum to Environmental Noise Assessment

Dear Mr. Ramey:

Illingworth & Rodkin (I&R) has been received notification that our Environmental Noise Assessment report (ENA) for the proposed Ramey Winery at 7097 Westside Road did not consider noise impacts to an existing residence on the Williams-Selyem Winery site at 7181 Westside Road immediately south of the WEST project site (see Residence 4 in Figure 1). Following the methodology used in our ENA, and considering that the ambient noise environment at the newly analyzed residence would be similar to that measured at location LT-1 (influenced by Westside Road traffic) we have analyzed the potential noise impacts from all winery operations and uses addressed in the ENA at the property line shared with Residence 4 and where needed developed mitigation measures to allow project compliance with the County NE-2 standard at the property line of Residence 4[1]. The results of these analyses are presented below:

Impact 1: Traffic, Parking Lot and Truck Noise

Automobile parking and traffic

The winery building on the WEST project site will include a semi-porous concrete driveway/parking / truck turn around area. Based on review of the current site plans the acoustic center of the 12 regular parking stalls in this area will be 75 feet from the property line of Residence 4.

---

[1] It should also be noted that Williams-Selyem Winery has proposed a barrel building on their site which we understand is directly between the proposed Ramey winery building and the existing residence on the Williams-Selyem property which is the subject of this addendum. Though not explicitly analyzed in this addendum, such a structure would likely provide additional noise attenuation between the property and the home, thus further reduce any noise impacts on this residence.

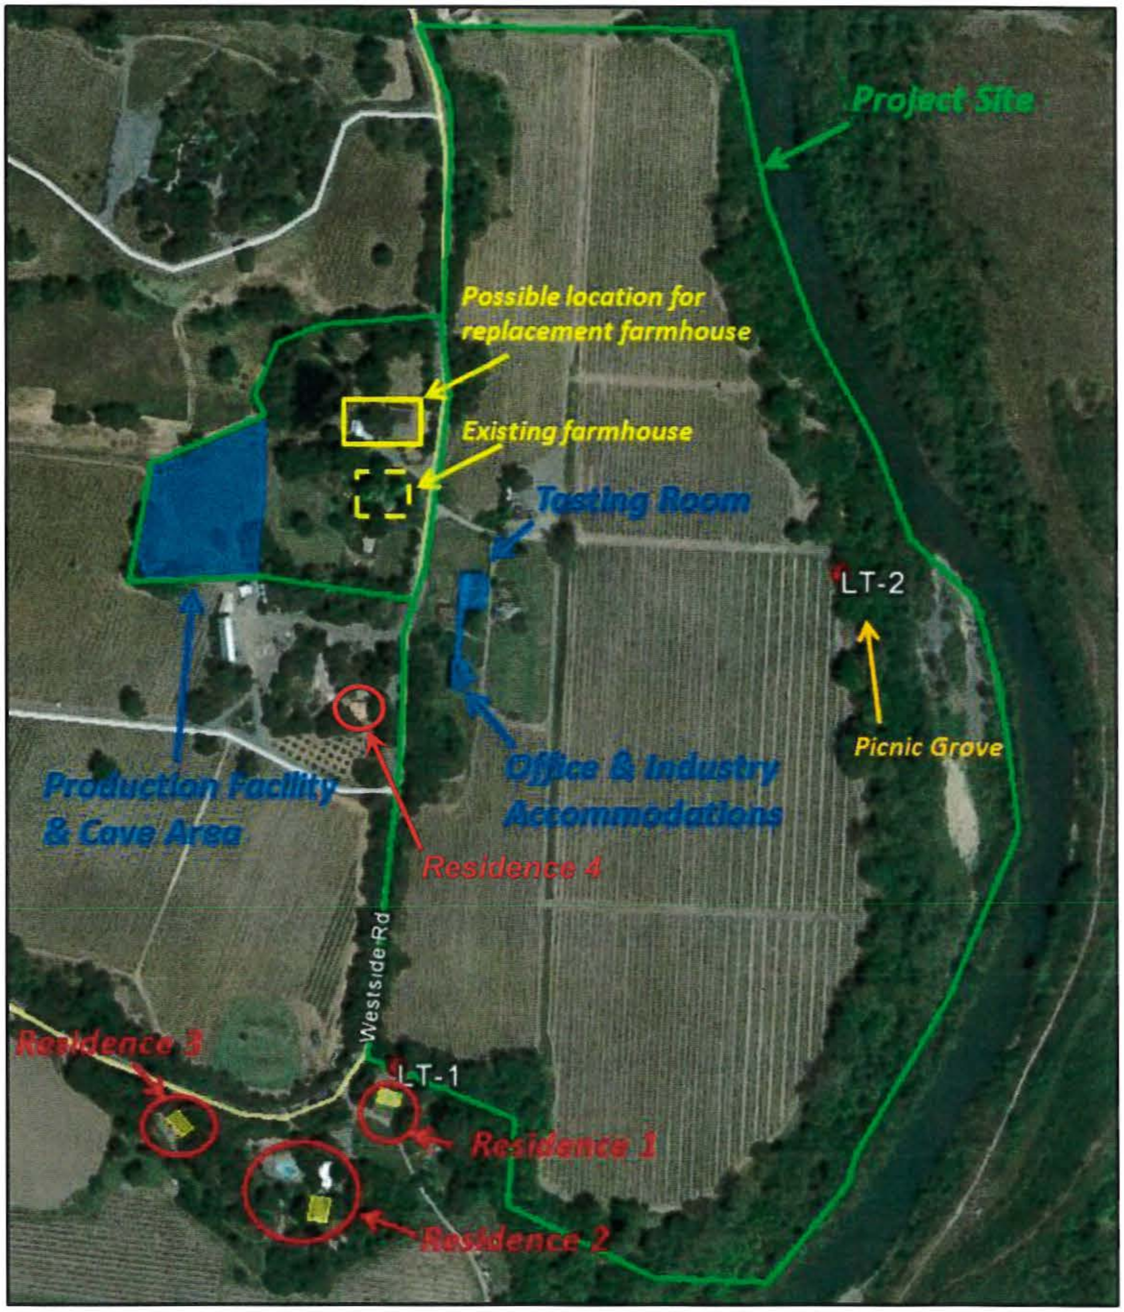

Figure 1: Winery Site Plan and Measurement Locations

Considering these distances, noise generated by automobile and light vehicles would be between 49 and 59 dBA at the property line of Residence 4. Given the expected visitor and employee use, these activities are expected to occur for less than five minutes out of an hour on a typical day and fall in the L_{02} NE-2 daytime category of 65 dBA (see Table 2 in ENA). However, during events or on busy weekends, such activities may occur more frequently and fall in the L_{08} NE-2 daytime category of 60 dBA. The ambient noise environment in this area is described by measurements at site LT-1. Table 1 summarizes the assessment of automobile noise in driveways and in parking lots at the property line of Residence 4.

Table 1: Parking Lot Automobile L_{08} Noise Levels

	L_{08} (Noise Level Exceeded 5 minutes in Any Hour), dBA
	Residence 4
Unadjusted Table NE-2 Daytime Limit	60
Daytime Ambient Noise Levels	53
Ambient Exceeds NE-2 Limit	No
NE-2 Adjustment	+0
Driveway/Parking Lot Noise at Receiver	**49 to 59**
Operations Exceed Ambient by 10 dBA?	No
NE-2 Adjustment	+0
Adjusted Table NE-2 Daytime Limit	60
Driveway/Parking Noise Exceeds NE-2?	No

Based on this finding, noise levels associated with automobiles and light vehicles using the project driveways and parking lots would not exceed the daytime NE-2 noise standards at the property line of Residence 4.

Truck traffic

Trucks visiting the winery site will use the new driveway and parking , truck loading and turn around area to access the wine production facility on the west side of the roadway. The centerline of the main winery access path will take constant speed and maneuvering trucks within 50 feet from the property line of Residence 4. However, at this close proximity the retaining wall at the edge of the parking / truck turn around area will act as a partial barrier to property line truck noise. Where truck noise is unshielded by the retaining wall the distance from the centerline of the main winery access path to the property line is 90 feet. Using this closest unshielded distance, noise generated by heavy-duty trucks may range from 65 to 70 dBA and medium-duty trucks may range from 55 to 60 dBA at the property line of Residence 4. Truck operations are expected to occur during daytime hours only and on a basis of one to five minutes per hour, or less, since it is unlikely that more than one heavy truck would arrive and depart during any given hour. Thus, truck operations would fall in the L_{02} NE-2 category of 65 dBA (see Table 2 in the ENA) at the adjacent residential uses. Table 2, following, presents and summarizes the assessment of truck traffic noise.

Table 2: Truck L_{02} Noise Levels

	L_{02} (Noise Level Exceeded 1 minute in Any Hour), dBA
	Residence 4
Unadjusted Table NE-2 Daytime Limit	65
Daytime Ambient Noise Levels	57
Ambient Exceeds NE-2 Limit	No
NE-2 Adjustment	+0
Heavy Truck Operations at Receiver	**65 to 70**
Medium Truck Operations at Receiver	**55 to 60**
Operations Exceed Ambient by 10 dBA?	No
NE-2 Adjustment	+0
Adjusted Table NE-2 Daytime Limit	65
Truck Traffic Noise Exceeds NE-2?	**Yes**, Heavy Trucks; No, Medium Trucks

Based on these findings, noise associated with medium truck traffic at the project is not expected to exceed daytime NE-2 noise standards at the property line of Residence 4, however heavy truck traffic would exceed these standards by up to 5 dBA.

Mitigation 1: Truck Noise Attenuation
To reduce noise levels from heavy trucks using the truck loading and turn around area the height of the retaining wall on the south side of the loading area should be extended to 6 feet above existing (above retaining wall) grade. A wall with a height of 6 feet above the existing ground level should then be extended for 100 feet parallel to the property line as shown in Figure 2.

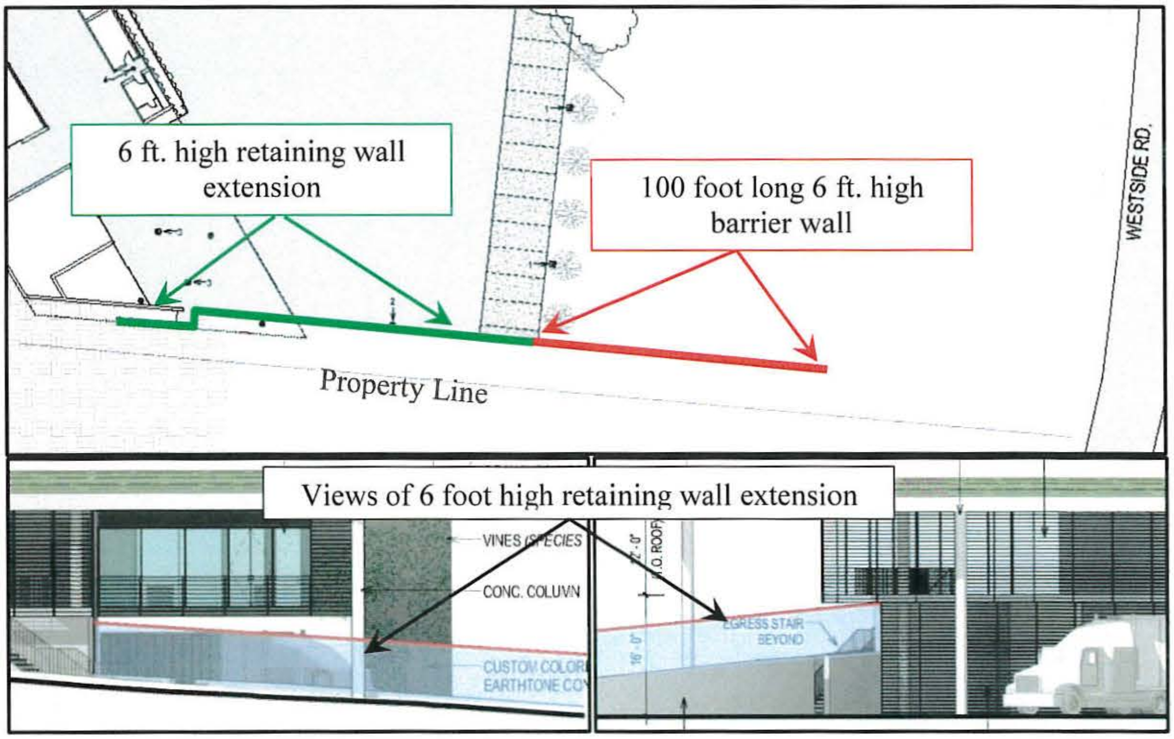

Figure 2: Plan and Views of Noise Barrier placement

To be effective as a noise barrier, this wall must be built without cracks or gaps in the face or large or continuous gaps at the base and have a minimum surface weight of 3.0 lbs. per sq. ft. Acceptable materials for such walls include a 2x4 wood framed wall with wood or stucco finishes, masonry block walls, and pre-cast concrete panels. A wood fence type wall may also be used. For wood fencing walls to meet these requirements we recommend that a homogenous sheet material, such as 3/4" plywood, be used as a backing for typical 1" thick (nominal) wood fence slats. Using the plywood ensures the continued effectiveness of the barrier with age, since wood slats alone have a tendency to warp and separate with age, allowing gaps to form and the barrier effect of the wall diminish.

Impact 2: Mechanical Equipment Noise

The project would likely include noise-generating mechanical equipment, such as air-cooled condensing units, pumps, and compressors, at the wine production facility, as well as less-significant sources of noise, such as air-conditioning systems and exhaust fans. The project description and drawings show this equipment in a semi-open area on the southern side of the upper floor of the winery building as close as 10 feet from the property line of Residence 4.

Using the source levels discussed in the ENA and considering the semi-open area of the building to provide only one half of the conservative (minimal) rate of structural attenuation listed in the ENA (12 dBA listed in the ENA, 6 dBA used in this analysis), constant L_{50} noise levels from mechanical equipment may be between an L_{50} of 68 and 70 dBA at the property line of Residence 4. Table 3, following, summarizes the assessment of mechanical equipment noise.

Table 3: Mechanical Equipment L_{50} Noise Levels

	L_{50} (Noise Level Exceeded 30 minutes in Any Hour), dBA
	Residence 4
Unadjusted Table NE-2 Daytime Limit	50
Daytime Ambient Noise Levels	48
Daytime Ambient Exceeds NE-2 Limit?	No
Daytime NE-2 Adjustment	+0
Unadjusted Table NE-2 Nighttime Limit	45
Nighttime Ambient Noise Levels	47
Nighttime Ambient Exceeds NE-2 Limit?	**Yes**
Nighttime NE-2 Adjustment	+2
Mechanical Equipment Noise at Receiver	**68 to 70**
Operations Exceed Ambient by 10 dBA?	Yes (day & night)
NE-2 Adjustment	-5 (day & night)
Adjusted Table NE-2 Daytime Limit	45
Adjusted Table NE-2 Nighttime Limit	42
Mechanical Equipment Noise Exceeds NE-2?	Yes (day & night)

Based on these findings, noise associated with mechanical equipment is expected to exceed daytime or nighttime NE-2 noise standard at the property line of Residence 4.

Mitigation 2: Mechanical Equipment Room

The southern façade and part of the eastern façade (to cut line 9 as shown in the project drawings) of the Mechanical Equipment Room should constructed as solid walls as shown in Figure 3, below.

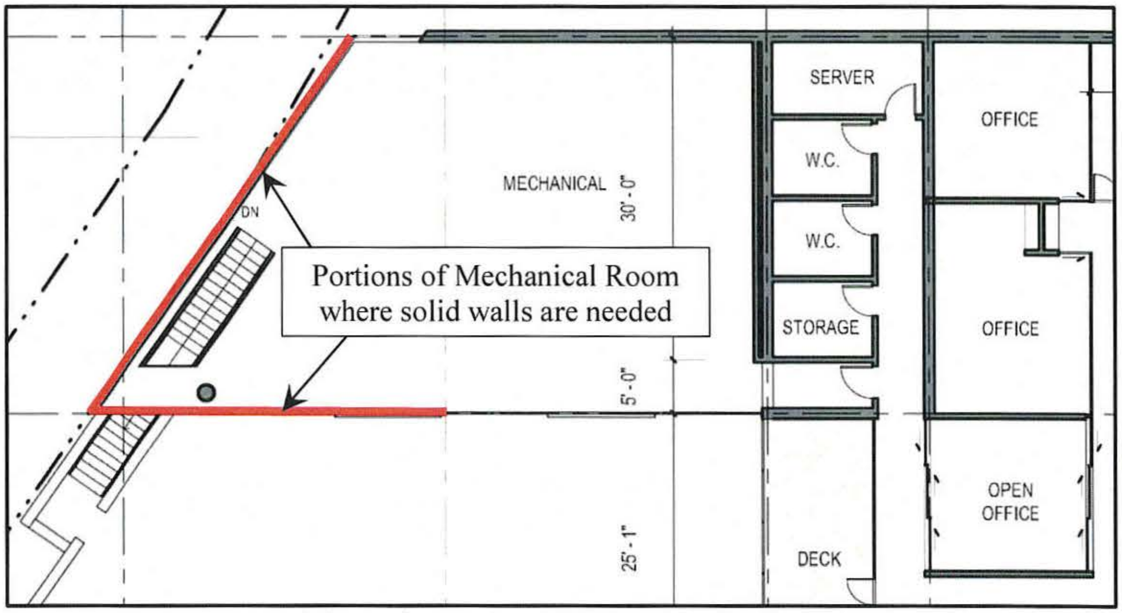

Figure 3: Mechanical Room Mitigation

Impact 3: Crush-Related Noise

Annual crush-related activities would take place within the new wine production building. The crush pad & press equipment room will be located on the first floor and on the western side of the building at about 150 feet from the property line of Residence 4. Because this use will be in the central portion of the new winery building and below the grade of the adjacent property line noise from it will be reduced by structural and terrain noise shielding. Using the source levels in the ENA, considering a minimum structural and terrain noise shielding factor of 10 dBA, and a 6 dB sound reduction for each doubling of the distance, constant L_{50} noise levels from crush-related activities would be 56 dBA at the property line of Residence 4. Table 4, below, summarizes these calculations. The maximum noise events discussed in the ENA, such as bin drops, etc., would be an L_{02} of 60 dBA at the property line of Residence 4. Table 5 summarizes the maximum noise events assessment of crush-related activities.

Table 4: Crush-Related L_{50} Noise Levels

	L_{50} (Noise Level Exceeded 30 minutes in Any Hour), dBA
	Residence 4

NE-2 Adjustment	+0 (day & night)
Adjusted Table NE-2 Daytime Limit	50
Adjusted Table NE-2 Nighttime Limit	47
Crush-Related Noise Exceeds NE-2?	**No** (day & night)

Table 5: Crush-Related L_{02} Noise Levels

	L_{50} (Noise Level Exceeded 30 minutes in Any Hour), dBA
	Residence 4
Unadjusted Table NE-2 Daytime Limit	65
Daytime Ambient Noise Levels	57
Daytime Ambient Exceeds NE-2 Limit?	No
Daytime NE-2 Adjustment	+0
Unadjusted Table NE-2 Nighttime Limit	60
Nighttime Ambient Noise Levels	51
Nighttime Ambient Exceeds NE-2 Limit?	No
Nighttime NE-2 Adjustment	+0
Crush-Related Noise at Receiver	**60**
Operations Exceed Ambient by 10 dBA?	No (day & night)
NE-2 Adjustment	+0 (day & night)
Adjusted Table NE-2 Daytime Limit	65
Adjusted Table NE-2 Nighttime Limit	60
Crush-Related Noise Exceeds NE-2?	**No** (day & night)

Based on the findings shown, noise associated with crush related noise is not expected to exceed daytime or nighttime NE-2 noise standard at the property line of Residence 4.

Mitigation 3: None needed

Impact 4: Bottling Noise
According to the building floor plans provided, bottling will be done in the production facility area, next to the truck access loading zone. The center of the bottling area will be about 110 feet to the property line of Residence 4. As with noise in the crush pad area, the building and terrain will provide shielding from noise created during bottling activities. Considering a minimum structural and terrain noise shielding factor of 10 dB, and a 6 dB sound reduction for each doubling of the distance, noise from bottling activities are expected to be an L_{50} of 53 dBA at the property line of Residence 4 Residence 1. Table 6 summarizes the assessment of bottling noise.

Table 6: Bottling L_{50} Noise Levels

	L_{50} (Noise Level Exceeded 30 minutes in Any Hour), dBA
	Residence 4
Unadjusted Table NE-2 Daytime Limit	50
Daytime Ambient Noise Levels	48
Daytime Ambient Exceeds NE-2 Limit?	No
Daytime NE-2 Adjustment	+0
Unadjusted Table NE-2 Nighttime Limit	45
Nighttime Ambient Noise Levels	47
Nighttime Ambient Exceeds NE-2 Limit?	**Yes**
Nighttime NE-2 Adjustment	+2
Bottling Noise at Receiver	**53**
Operations Exceed Ambient by 10 dBA?	No (day & night)
NE-2 Adjustment	+0 (day & night)
Adjusted Table NE-2 Daytime Limit	50
Adjusted Table NE-2 Nighttime Limit	47
Bottling Noise Exceeds NE-2?	**Yes** (day & night)

Based on the findings shown, noise associated with bottling noise is expected to exceed daytime or nighttime NE-2 noise standard at the property line of Residence 4.

Mitigation 4: Bottling Noise
The incorporation of the 6 foot high sound barrier as discussed under Mitigation Measure 1 will also be effective in reducing daytime or nighttime bottling noise levels to below the L_{50} NE-2 noise standards. Therefore, no additional mitigation is needed for bottling activities at the project site.

Impact 5: Maintenance and Forklift Operations
Forklift and maintenance operations would likely take place on the first floor inside the new winery building, in the outdoor crushing and receiving areas, and possibly in the winery caves. Such activities within the winery building would receive significant noise shielding from the building and are not analyzed here. The crush area would also receive considerable shielding from the building. Outdoor forklift and maintenance operations in the truck loading area are considered a worst-case condition and are analyzed. Based on a review of project drawings, the center of the closest truck loading outdoor area will be about 55 feet from the property line of Residence 4. Using the source levels discussed in the ENA, a 6 dB shielding factor for the retaining wall at the edge of the truck loading area and a 6 dB sound reduction for each doubling of the distance between the noise source and the receiver, noise from forklift and maintenance operations activities are expected to be an L_{08} of 60 dBA at the property line of Residence 4.

Table 7, following, summarizes the assessment of noise due to forklift and maintenance operations. Note, forklift and maintenance operations will only occur during the daytime hours.

Table 7: Forklift and Maintenance L_{08} Noise Levels

	L_{08} (Noise Level Exceeded 5 minutes in Any Hour), dBA
	Residence 4
Unadjusted Table NE-2 Daytime Limit	60
Daytime Ambient Noise Levels	53
Ambient Exceeds NE-2 Limit?	No
NE-2 Adjustment	+0
Forklift/Maintenance Operations at Receiver	**60**
Operations Exceed Ambient by 10 dBA?	No
NE-2 Adjustment	+0
Adjusted Table NE-2 Daytime Limit	60
Forklift/Maintenance Operations Noise Exceed NE-2?	No

Based on the findings shown in Table 7, noise associated with forklift and maintenance operations is not expected to exceed daytime NE-2 noise standards at the property line of the residential use at 7181 Westside.

Mitigation 5: None Needed

Impact 6: Event Noise at adjacent residential uses

Special events, such as concerts and weddings, are not planned, nor requested at the winery; however, the winery does plan to participate in county-wide industry events. The project application includes provisions for 24 special events per year, including 10 winemaker lunches or dinners with 30 persons in attendance, five 60-person private tastings, five 120-person private tastings, two 300-person new wine release tastings, and two 300-person industry-wide events. For an event consisting of 300 persons, a staff of approximately 14 people is expected. Table 1 in the ENA provides locations and hours of these events. It should be noted that amplified music and amplified speech are not proposed at any outdoor events.

A review of the project site plans indicates that outdoor events would be held in the picnic grove area located along the eastern boundary of the property near LT-2. Indoor events would be held inside the tasting room or barn. The production facility on the west side of the roadway will only be opened to guests by invitation only. Based on a review of building plans and elevations, events occurring within the winery buildings would receive noise shielding from the building structures estimated at 12 dBA with open windows and/or doors, and a minimum of 22 dBA with closed non-sound rated windows and/or doors. However, the outdoor events held in the picnic grove area would receive little to no noise attenuation from intervening terrain or building structures at the property line of Residence 4.

Based on a review of aerial photos and the project site plan, distance information obtained using Google Earth indicates that outdoor events that take place in the picnic grove would be over 1000 feet from the property line of Residence 4. The event space and guest rooms located in the barn are the closest indoor rooms for events. From the maps, indoor events at these locations would be as close as 125 feet from the property line of Residence 4. Using these distances and the noise shielding considerations for outdoor and indoor events, the L_{50} sound levels for the typical noise source levels listed in Table 4 of the ENA (and the County requested *peak* L_{50} level for musical instruments of 88 dBA at 40 feet) for outdoor and indoor events have been calculated at the property line of Residence 4.

Table 8 summarizes the assessments for outdoor special events noise in the picnic grove area. Since amplified music and speech are not proposed at these outdoor events, they are not shown in these tables. Table 9 summarizes the assessment for the indoor special event noise. Since special events would not occur during nighttime hours (see Table 1 of the ENA), the County's nighttime limits shown in Table NE-2 would not be applicable to the proposed project and are not shown in Tables 8 or 9.

Notes: 1. Amplified Music levels have been evaluated using a *peak* L_{50} level for musical instruments of 88 dBA at 40 feet as requested by County Staff. The use of these levels results in sound levels 14 dBA higher than those which have been adopted by the Sonoma County Winery Event Working Group (see discussion on page 7 of the ENA).

Based on the findings shown in Table 9 with open windows indoor events with peak amplified music would exceed the County daytime and nighttime NE-2 standards at property line of

Residence 4 by 26 dBA and normal amplified music, amplified speech and non-amplified music would exceed the County daytime NE-2 standards by 2 to 7 dBA at property line of Residence 4. However, the findings shown in Table 9 also indicate that with closed windows all indoor events, with the exception of those with peak amplified music, would meet the County daytime NE-2 standards at the property line of Residence 4.

Mitigation 6: Indoor Special/Promotional Events
The following measures should be included in the project:

1. Indoor events with amplified or speech or non-amplified music should only occur within the baling barn or tasting room buildings with closed windows and doors.
2. Amplified music within the baling barn or tasting room buildings should be maintained at normal, not peak amplification levels, such that the L_{50} level of the amplified music not exceed 72 dBA at a distance of 50 feet.

With the implementation of the above mitigation measures, noise levels at the property line of Residence 4 would be maintained at or below the County NE-2 standards.

This concludes I&R's amendment to our Environmental Noise Assessment report (ENA) for the proposed Ramey Winery at 7097 Westside Road to consider noise impacts to an existing residence on the Williams-Selyem Winery site at 7181 Westside Road immediately south of the WEST project site. Please do not hesitate to call with any questions or concerns.

Sincerely,

Fred M. Svinth, INCE, Assoc., AIA

RE: GEOLOGIC REPORT FOR GENERAL PLAN POLICY WR-2e
RAMEY WINERY, 7097 WESTSIDE ROAD, HEALDSBURG, CA
PRMD APPLICATION No. UPE14-0008
EBA JOB No. 16-2366

Dear Staff:

This Geologic Report presents the results of a groundwater availability study conducted for the property at 7097 Westside Road, located approximately five miles south of Healdsburg, California (see Figure 1, Appendix A for site location). The groundwater availability study was requested by the County of Sonoma, Permit and Resource Management Department (CS-PRMD) in association with the use permit process for the winery and tasting room operation proposed by the Applicant. The work presented herein was performed to comply with the California Environmental Quality Act (CEQA). The purpose of CEQA is to identify the significant impacts of the project and to avoid or mitigate those impacts, if feasible. The scope of work also included an assessment of potential depletion effects on the Russian River as a result of groundwater pumping associated with the proposed project and estimate the effects of drawdown, if any, on adjoining and nearby properties.

1.0 BACKGROUND INFORMATION

1.1 Site Description

The existing property consists of an approximate 75-acre (AC) parcel identified as Assessor's Parcel No. (APN) 110-240-031. A site plan illustrating the primary site features is presented as Figure 2 (Appendix A). As shown on Figure 2, the site straddles Westside Road. The portion of the property east of Westside Road encompasses approximately

69 AC, of which approximately 42 AC is currently developed with vineyard. Other features on this portion of the property include a former hop kiln building, a former hop baling barn, and several small outbuildings, all of which are located along the east side of Westside Road. The remainder of this area is undeveloped and mostly covered with seasonal grasses and thick stands of trees. On the west side of Westside Road (approximately 6 AC), site features include a 3-bedroom single family dwelling unit, a small outbuilding, a barn and shed, a garden, and a 3.5 acre-foot (AF) frost protection pond. The topography on the western portion of the property and along Westside Road is slightly hilly, whereas the vineyard area to the east can be characterized as gently sloping from west to east in the direction of the Russian River. Site elevations across the site range from approximately 130 feet above mean sea level (MSL) on the west to approximately 50 feet MSL along its eastern margin.

The property is currently equipped with five water supply wells located along the eastern margin of the property (see Figure 2). These wells are identified herein as Wells #1 through #5 and are used to provide water for the on-site operations, and to two neighboring property owners to the west. Further details regarding the existing and proposed water use for the respective wells are provided as follows:

- *Well #1:* Used solely for the proposed on-site development, including the winery and tasting room.
- *Well #2:* Currently used to supply water to a single family dwelling located on a neighboring property to the west (APN 110-240-039). The water is provided under an Easement Grant Deed. This use will not change as part of the proposed project.
- *Well #3:* Currently used to supply water for irrigation and frost protection for the on-site vineyards. Water from this well will also be used for landscape irrigation related to the proposed on-site development.
- *Well #4:* Currently used to supply water to the various structures and garden on the western portion of property. This use will not change as part of the proposed project.
- *Well #5:* Currently used to supply water for vineyard irrigation on a neighboring property to the west (APN 110-240-024). Similar to Well #2, the water is provided under an Easement Grant Deed. This use will not change as part of the proposed project.

Wells #2 through #5 were installed between 1988 and 1990, whereas Well #1 was installed in 2013. These wells range in depth from approximately 60 to 110 feet below ground surface (BGS).

The area surrounding the project site consists of rural agricultural properties to the north, west and south. Property use is comprised mostly of vineyards and rural single family dwelling units. Also present on adjoining properties to the west are one current winery (Williams-Selyem) and one winery under construction (Arista), and one current tasting room (Gracianna) on the north adjoining property. The eastern portion of the project site is bordered by the Russian River. Please refer to Figure 2 (Appendix A) for a site plan illustrating the aforementioned features.

1.2 Proposed Development

The primary improvements associated with the proposed development will include: 1) construction of a new winery and wine caves; 2) re-purposing the existing hop kiln building into public tasting rooms; 3) re-purposing the existing hop baling barn into private tasting rooms and marketing accommodations; and 4) enlargement of existing and construction of new driveways and parking areas. The winery and wine caves will be located on the west side of Westside Road in the western portion of the parcel. The winery will have a maximum annual production capacity of 60,000 cases. The existing 3-bedroom single family dwelling unit, as well as the barn and shed, will remain. As previously noted, the buildings to be re-purposed are located on the east side of Westside Road. The tasting rooms will be open seven days a week. The facility will also hold up to 22 agricultural promotional events per year, as well as participate in industry-wide events totaling two event days per year.

Wells #1 and #3 will service the proposed development. In the case of Well #1, this well was installed in August 2013 and was constructed with a 50-foot sanitary seal, thereby making it suitable as a public water supply source for the proposed winery and domestic uses associated with the various facility operations. As a means of confirming it's suitability for the proposed improvements, an 8-hour well capacity test was performed on January 16, 2014 by Petersen Drilling & Pump, Inc. that demonstrated a sustainable yield of 45 gallons per minute (GPM) with a resulting drawdown of 1.5 feet. Full recovery following the cessation of pumping was achieved within one hour. A copy of the test pump and recovery log documenting the test results is enclosed in Appendix B. As for Well #3, this well will be used for landscape irrigation. Whereas pumping test data is not available for Well #3, it has a reported yield of approximately 300 GPM.

1.3 Local Geology and Hydrogeology

A geologic map presented in *Bulletin 118-4* (California Department of Water Resources [CDWR], 1983) indicates that the central and eastern portions of the project site area are underlain by Holocene alluvium (Qal) associated with the Russian River depositional system. The alluvium beneath and adjoining the Russian River are comprised of unconsolidated, coarse-grained gravel and sand deposits that can be highly permeable, with reported yields in excess of 1,000 GPM. As you move away from the river, the alluvium contains less coarse-grained material and more silt and poorly sorted sands and gravels with lower permeability characteristics. Quaternary terrace deposits (Qt) are present along the western margin of the property that consist of cross-bedded deposits of sand and gravel originally formed as alluvial fan or stream channel deposits. Finally, the terrace deposits are bound to the west by rocks identified as the Jura-Cretaceous

Franciscan Complex (KJ), which consist of sandstone, shale, greenstone, chert and serpentine. The Franciscan Complex underlies both the terrace deposits and alluvium in the area and typically exhibits very low yield characteristics. Please refer to Figure 3 (Appendix A) for a geologic map of the site vicinity.

Based on information outlined in the Water Well Drillers Reports (WWDRs) for Wells #1 through #5, each of the wells are fully screened across the Qal deposits (alluvium) to depths ranging from approximately 40 to 100 feet BGS and are seated into the underlying Franciscan Complex bedrock. Yields as recorded on the WWDRs range from approximately 40 to 760 GPM.

The most prominent surface water feature in proximity of the project site is the Russian River, which borders the entire eastern boundary of the property. The Russian River is a managed water system as governed by State Water Resources Control Board (SWRCB) Decision 1610 (SWRCB, 1986) that receives regulated surface water discharges from Lake Mendocino and Lake Sonoma (via Dry Creek). As such, surface water flow in the Russian River is perennial in nature. As shown on Figure 2 (Appendix A), Wells #1 through #3 range from approximately 250 to 340 feet from the edge of the primary river channel, whereas the separation from Wells # 4 and #5 is approximately 70 feet. Please note that the project site is not located within one of the drought priority watersheds or reaches of interest identified in the State Water Resources Control Board's Russian River Tributaries Emergency Regulation.

2.0 WATER DEMAND

The projected water use for the proposed development was determined by Adobe Associates, Inc. (Adobe) and presented in a letter report dated December 30, 2015 (Adobe, 2015). Please note that the aforementioned letter report also included water projections for vineyard irrigation and frost protection, which are not part of this proposed project. In this regard, the water demand for the proposed project corresponds to the winery, domestic use (i.e., employees, tasting rooms, marketing accommodations, and promotional/industry-wide events), and landscaping. Table 1 on the following page provides a summary of the project water demands based on Adobe's analysis. Please refer to Appendix C for excerpts from Adobe's letter report summarizing the projected water use calculations.

TABLE 1
SUMMARY OF PROJECT WATER DEMANDS

Description	***Gallons per Year***	***Acre-Feet per Year***
Winery	864,000	2.65
Domestic Use(1)	104,083	0.32
Landscape Irrigation	52,863	0.16
Extended Totals	**1,020,946**	**3.13**

(1): Domestic Use includes employees, tasting rooms, marketing accommodations and promotional/industry – wide events.

Please note that for the sake of consistency with Adobe's analysis, following discussions pertaining to water demands are presented in units of gallons, whereas subsequent discussions pertaining to the river depletion analysis are presented in unit of acre-feet (AF).As previously noted, Well #1 will provide water supply for the winery and various domestic uses associated with the project. Based on the projections presented in Table 1, the total water demand for these sources equates to 1,020,946 gallons per year (GPY). In addition to total water use, the average daily and maximum peak daily demands were estimated using the same data. The average daily demand over a 365-day period equates to 2,652 gallons per day (GPD). The maximum peak daily demand, in turn, was estimated by combining applicable site activities that could theoretically occur in a given day. Information provided by the Applicant indicates that these activities could include: crush operations (3,600 GPD); promotional event visitors (300 GPD); tasting room visitors (63 GPD); marketing accommodations (240 GPD); and associated employees (360 GPD). This translates to a maximum peak daily demand of 4,563 GPD.

Well #3 will be used for landscape irrigation. As outlined above, the projected total water demand for landscaping is 52,863 GPY. This translates to an average daily demand over a 365-day period of 145 GPD. In regards to the maximum peak daily demand, the maximum use occurs over the period of June through August (22,536 gallons). Assuming a conservative irrigation cycle of one day per week, the corresponding peak maximum daily demand equates to approximately 1,735 GPD.

3.0 GROUNDWATER AVAILABILITY ANALYSIS

The primary objective of the water resources element of the Sonoma County General Plan is to ensure that Sonoma County's water resources are sustained and protected, including both surface water and groundwater. The project site is located within a Class 1 water area, which is identified as representing a major groundwater basin that is typically characterized by robust groundwater yields. This classification is supported by *Bulletin 118-4* (CDWR, 1983) as previously outlined in Subsection 1.3 (*Local Geology and Hydrogeology*), which indicates that the alluvium beneath and adjoining the Russian

River are comprised of unconsolidated, coarse-grained gravel and sand deposits that can be highly permeable, with reported yields in excess of 1,000 GPM.

The combination of demonstrated appreciable yields and the relatively nominal water demand for a Class 1 aquifer system indicate that the aquifer underlying the project site should be more than adequate to support the project while imparting negligible groundwater drawdown effects on neighboring properties. Further details supporting this position are as follows:

- The Russian River is a managed water system that ensures perennial flow throughout the year. As such, the Russian River serves as a continuous source of recharge to the underlying alluvial aquifer system. This contribution, coupled with recharge from seasonal rainfall, minimizes the potential for depletion of the aquifer system. This is demonstrated by static water levels in Wells #1, #2 and #4 as measured by EBA on October 4, 2016 that are essentially the same as those measured at the time the wells were installed in 2013, 1988, and 1988, respectively. Please note that the water level in Well #3 could not be measured, whereas Well #5 was operating at the time of EBA's inspection.
- The 8-hour well capacity test performed on Well #1 in January 2014 demonstrated a sustainable yield of 45 GPM while only inducing 1.5 feet of drawdown. This is indicative of a highly prolific aquifer. By comparison, the maximum peak daily water demand for the winery and domestic uses is only 4,563 gallons, which equates to less than two hours of pumping.
- At a reported pumping rate of 300 GPM, Well #3 will only have to pump for an additional six minutes to meet the maximum peak daily water demand of 1,735 gallons for the irrigation of new landscaping. This additional pumping is considered de minimis.
- Data from the well capacity test performed on Well #1 was used to estimate the radius of influence induced by the pumping operations. Based on computer modeling, the estimated resulting radius of influence after eight hours of pumping was less than 160 feet. The radius of influence for the maximum peak daily demand scenario is even less at less than 100 feet. Since the closest neighboring property west of the Russian River is more than 1,100 feet away from Well #1, it can be concluded that the pumping of this well will not impact neighboring off-site water supply wells. Please note that based on the minimal additional pumping duration associated with Well #3 (six minutes), a similar analysis was not performed for this well.

4.0 RIVER DEPLETION ANALYSIS

Based on the proximity of Wells #1 and #3 to the Russian River, an analysis was performed to estimate the rate and volume of stream depletion that may result from the proposed pumping operations. The estimates were generated using a technique presented in a United States Geological Survey (USGS) manual for hydrologic analysis and interpretation as developed by C.T. Jenkins (Jenkins, 1968). The approach utilizes a series of type curves and equations, coupled with aquifer parameters (i.e., transmissivity and specific yield), to calculate both rate and volume estimates. The following provides an incremental breakdown of the approach:

1. Calculate the stream depletion factor (sdf), in days

$$\text{sdf} = \frac{a^2}{T / S}$$

where:
a = perpendicular distance from the pumped well to the stream, in feet
T = transmissivity, in feet squared per day
S = specific yield, dimensionless

2. Establish the total time of pumping (t_p), in days

3. Calculate the ratio of total time pumping versus stream depletion factor; i.e., t_p / sdf

4. Determine the ratio of rate of stream depletion (q) versus net steady pumping rate (Q) (i.e., q / Q) using the Type Curve A (see Appendix D).

5. Determine the ratio of volume of stream depletion (v) versus net volume pumped during time t_1 (Q_t) (i.e., v / Q_t) using the Type Curve B (see Appendix D).

6. Calculate the rate of stream depletion (q) by multiplying the net steady pumping rate (Q) by the q / Q ratio determined from Type Curve A (Step 4).

7. Calculate the annual volume of stream depletion (v) by multiplying the net steady pumping rate (Q) by the v / Q_t ratio determined from Type Curve B (Step 5) and by the duration (in days) of the pumping period.

Depletion rates and volumes were estimated for several different scenarios. These scenarios were as follows: _Scenario 1)_ average daily pumping rate for Well #1 over a 365-day period for all winery and domestic water uses; _Scenario 2)_ average daily pumping rate for Well #1 during the 60-day crush period, including winery operations and employee domestic use; and _Scenario 3)_ average daily pumping rate for Well #3 over a 365-day period for landscape irrigation.

Variables used in the analysis are listed below. A specific yield (S) of 20 percent was used based on literature values. This variable, coupled with pumping and drawdown data from the 8-hour well capacity test, was used in a computer model based on the Theis nonequilibrium well equation (Theis, 1935) to calculate the transmissivity (T). The distances (a) from the stream (i.e., Russian River) were determined from the site plan

(Figure 2, Appendix A). Finally, the net steady pumping rates (Q) were calculated using the various water demands determined by Adobe (Adobe, 2015).

- Transmissivity (T):	5,348 feet squared per day
- Specific Yield (S):	0.20 (i.e., 20 percent)
- Distance from Stream (a)	
- Well #1:	320 feet
- Well #3:	280 feet
- Net Steady Pumping Rate (Q)	
- Well #1 (average daily over 365-day period):	2,652 GPD
- Well #1 (average daily over 60-day crush period):	4,263 GPD
- Well #3 (average daily over 365-day period):	145 GPD

Table 2 provides a summary of the depletion rates and volumes for the respective scenarios. The rates/volumes were calculated using the seven-step approach presented at the outset of this subsection, coupled with the common variables outlined above.

TABLE 2
SUMMARY OF RIVER DEPLETION RATES AND VOLUMES

Scenario⁽¹⁾	*sdf (days)*	*t_p (days)*	*Q (GPD)*	*q / Q Ratio*	*v / Q_t Ratio*	*q (GPD)*	*v (AF)*
1	3.8	365	2,652	0.90	0.90	2,387	2.41⁽²⁾
2	3.8	60	4,263	0.88	0.75	3,751	0.59⁽³⁾
3	2.9	365	145	0.90	0.90	131	0.15⁽²⁾

sdf:	Stream Depletion Factor
t_p:	Total Time of Pumping
Q:	Net Steady Pumping Rate
Q_t:	Net Volume Pumped During Time t_1
q:	Rate of River Depletion
v:	Volume of River Depletion
GPD:	Gallons per Day
AF:	Acre-Feet

(1): Scenarios 1 and 2 correspond to Well #1 and Scenario 3 corresponds to Well #3.

(2): Based on a 365-day pumping period.

(3): Based on a 60-day pumping period.

The significance of the results presented above were compared to discharge gauge data for the Russian River to assess the magnitude of the estimated depletion relative to the amount of surface water flow in the river. In this regard, the closest gauge data station corresponds to USGS Station 11465390, located less than 500 feet downstream from the site's southern property boundary. The approximate location of this station is shown on Figure 2 (Appendix A). Data for this station covers the period from April 2013 to October 2016 and is presented in a graphical format in Appendix E. As shown on the graph, flows over the monitoring period have ranged from approximately 87 to 1,000 cubic feet per second (CFS). Due to data gaps that coincide with the winter periods, an accurate determination of total annual flows at this station could not be calculated. In response to this limitation, the minimum flow rate of 87 CFS was used in the analysis, which is highly conservative since it corresponds to the lowest recorded reading over the 3.5-year data period and coincides with the 2015 drought. Based on the 87 CFS unit flow rate projected over a 365-day period, the total flow volume equates to 62,983 AF. Comparison of this flow to the combined flow volumes presented in Table 2 for Scenarios 1 and 3 (2.56 AF) over an equal period of time reveals that the Scenarios 1 and 3 volume equates to only 0.004 percent of the flow in the river, thereby demonstrating that the projected depletion is de minimis. As previously noted, this comparison is highly conservative in that the actual average flow rate in the Russian River is higher than the assumed minimum flow rate used in the analysis.

The same approach as described above was used to evaluate depletion characteristics during the 60-day crush period (Scenario 2). Based on the minimum flow rate of 87 CFS, the corresponding total flow over this period equates to 10,353 AF as compared to 0.59 AF for Scenario 2. This translates to 0.006 percent of the flow in the river over the period analyzed. As was the case for Scenarios 1 and 3, this projected amount of depletion is considered de minimis.

5.0 CONCLUSIONS

The water supply characteristics of the underlying aquifer utilized by Wells #1 and #3 are more than adequate to accommodate the water demands associated with the proposed improvements and will not result in negative impacts to local groundwater or surface water resources. This conclusion is based on the following variables: 1) the site is located within a Class 1 water area, which is identified in the Sonoma County General Plan as a major groundwater basin; 2) the underlying aquifer is comprised of alluvial deposits associated with the Russian River, which is a managed water system that ensures perennial flow throughout the year and serves as a continuous source of recharge to the aquifer; 3) well capacity test results for Well #1 demonstrated a sustainable yield of 45 GPM while only inducing 1.5 feet of drawdown. This is indicative of a highly prolific aquifer system; 4) based on the yield characteristics of the on-site wells, the wells will only have to pump for less than two hours (Well #1) and six minutes (Well #3) per day to accommodate the peak water flow demands; and 5) the projected radius of influence characteristics induced by the pumping operations will not encroach onto neighboring properties. In addition, the proposed water use is projected to induce no measureable changes in surface water flows in the Russian River.

6.0 LIMITATIONS

This report was prepared in accordance with generally accepted standards of professional hydrogeologic consulting principles and practices at the place and time this study was performed. This warranty is in lieu of all other warranties, either expressed or implied. The conclusions presented herein are based solely on information made available to us by others, and includes professional interpretations based on limited research and data. Based on these circumstances, the decision to conduct additional investigative work to substantiate the findings and conclusions presented herein is the sole responsibility of the Client. This report has been prepared solely for the Client and any reliance on this report by third parties shall be at such party's sole risk.

7.0 CLOSING

If you should have any questions regarding the information contained herein, please do not hesitate to contact our office at (707) 544-0784.

APPENDIX C

PROJECTED WATER USE CALCULATIONS
(ADOBE, 2015)

Ramey Winery Water Flow Calculations

Winery Production:

Annual water use:
60,000 case production x 2.4 gallons per case x 6 gal water use / gal wine = 864,000 gal

Peak daily use during crush:
60,000 x 2.4 x 1.5 / 60 day crush period = 3,600 gpd

Domestic Water:

Employees:
15 full time employees x 15 gal/day = 225 gallons per day x 250 days/yr = 56,250 gal
3 part time employees x 15 gal/day = 45 gallon per day x 150 days/yr = 6,750 gal
6 seasonal employees x 15 gal/day = 90 gallons per day x 40 days/yr = 3,600 gal

Tasting Room Visitors:
75 peak, 25 average; 25 x 2.5 gal x 365 = 22,813 gal

Event Visitors:
Industry Wide 2 days x 300 visitors x 2.4 gal = 1,500 gal
2 events of 300 visitors x 2.5 gal = 1,500 gal
5 events of 120 visitors x 2.5 gal = 1,500 gal
5 events of 60 visitors x 5 gal = 1,500 gal
10 winemaker lunch or dinner of 30 visitors x 10 (incl kitchen) = 3,000 gal

Marketing Accommodations:
2 rooms x 120 gal/rm x 24 days/yr = 5,760 gal

Total Domestic Water Demand: = 104,083 gal

HISTORICAL RESOURCE STUDY

I. Executive Summary

This Historical Resource Study was prepared by Knapp Architects on behalf of Ramey Wine Cellars. The report evaluates the historical and architectural significance of two agricultural buildings, the Hop Kiln and Baling Barn, and the wood Trestle that connected them at 7097 Westside Road in Healdsburg. This study concludes that the property appears to be eligible for listing in the California Register of Historical Resources (California Register) and would therefore be considered a historical resource for the purposes of the California Environmental Quality Act (CEQA). This document ends with an assessment of the impact of the proposed rehabilitation on the resource. This evaluation concludes that the project would conform to the Secretary of the Interior's Standards for Rehabilitation in almost all respects and would not materially impair the characteristics which make it eligible for listing, meaning that under the CEQA Guidelines, the project would have a less than significant impact on historical resources.

This report does not describe or analyze the existence of a potential historic district beyond the Hop Kiln, Baling Barn, and Trestle. Similarly, this report does not analyze the impact of the project on any potential historic resources or districts in the vicinity. This document considers historical architecture only, and not archaeological resources.

II. Introduction

The Hop Kiln, Baling Barn, and Trestle appear to have been construction between 1915 and the early 1930s. The site is located along the Russian River valley south of the town of Healdsburg in an area that has been farmed since the 19th century. To date the buildings have undergone very few alterations on the exterior or interior, although they have experienced moderate to severe deterioration in recent decades. The proposed project would rehabilitate the buildings with a small addition to the Hop Kiln, as part of a conversion of the property to use as a winery.

III. Methodology

In preparing this report, Knapp Architects visited and photographed the project site; conducted research at the Sonoma County History and Genealogy Library in Santa Rosa; the Healdsburg Museum; the California Historical Society in San Francisco, the Bancroft Library at UC Berkeley, and the San Francisco Public Library; searched online historical information; and checked federal, state, and local historical listings.

This study is geared to the provisions for historical resources in the California Environmental Quality Act and the associated CEQA Guidelines. This document applies the eligibility standards of the California Register of Historical Resources, with reference to the National Register of Historic

Baling Barn (left) and Hop Kiln (right), looking northwest.

Places (on which the California Register is based) for greater detail where necessary. The assessment of impacts of the proposed project is based on the CEQA Guidelines, which have a provision for applying the Secretary of the Interior's Standards for the Treatment of Historic Properties as a standard of less-than-significant impact levels.

IV. Current Historical Status

A. California Historic Resources Information System

Properties listed in the California Historic Resources Information System's (CHRIS) Historic Resource Inventory (HRI) or under review by the California Office of Historic Preservation (OHP) are assigned status codes of "1" to "7," establishing a baseline record of historical significance. Properties with a status code of "1" are listed in the California or National Register. Properties with a status code of "2" have been formally determined eligible for listing in the California or National Register. Properties with a status code of "3" or "4" appear to be eligible for listing in either register through survey evaluation. Properties with a status code of "5" are typically locally significant or of contextual importance. Status codes of "6" indicate that the property has been found ineligible for listing in any register and a status code of "7" indicates that the property has not yet been evaluated.

The building at does not have a California Register Status Code in the CHRIS historic data file for Sonoma County. This generally means that no survey or inventory that has been entered in the state's database lists this property. This includes the National Register and the California Register.

B. Sonoma County

The subject property is not listed in the County's inventory of landmarks designated by the County Landmarks Commission.

C. Healdsburg

The subject property is outside the City of Healdsburg and therefore is not included in the City's Historic District Overlay.

V. Description

Portion of Trestle (left) and Hop Kiln (center), looking north. Buildings to the right of the Hop Kiln are part of the project site but are not covered in this report.

Vicinity

The subject property is in the Russian River Valley in Sonoma County, fairly close to the geographic center of the county. The Russian River begins about six miles southeast of Willits in Mendocino County and flows south through a flat, fertile valley that varies in width from less than two miles to more than ten miles. The East Fork of the Russian River, which feeds Lake Mendocino and flows from it, joins the main river near Ukiah. The Russian River meanders along most of its length, but its overall course runs north-south to the vicinity of the subject property, where it turns west toward its mouth near Jenner on the Pacific coast. The Mayacamas Mountains form the eastern boundary of the valley, separating it from the Napa Valley; to the west, Black Mountain and the coastal hills form the west side of the valley, separating it from the coast. The subject property is about eight miles from downtown Healdsburg to the north, two miles from Windsor to the northeast, and eight miles from Santa Rosa to the southeast. Forestville is about two miles southwest of the subject property.

The valley floor is generally flat, with occasional rolling hills, occupied by fields, vineyards, and woodland. The river is narrow in some places and broad in others where the bed is dry much of the year; the riparian corridor is generally lined with woodlands. Westside Road runs south from Healdsburg along the river corridor to the bend where the river turns west, ending at River Road. Eastside Road follows a similar course on the opposite side of the Russian River. U.S. 101 and the remaining portions of its predecessor the Old Redwood Highway follow the Russian River through the valley from Santa Rosa through Windsor and Healdsburg to Cloverdale and points north. The valley has a long-established and consistently growing wine industry, along with other agricultural operations and tourism.

Site/Landscape

The subject property is on the east side of Westside Road, which runs north-south at this location, but turns at a right angle to the west about 1,000 feet to the south. It is on a 68-acre parcel, Assessor's block and lot 110-240-031-000. The topography slopes gently down from Westside Road to the east and flattening out so that most of the parcel is a nearly level vineyard, east of which is the wooded riverbank.

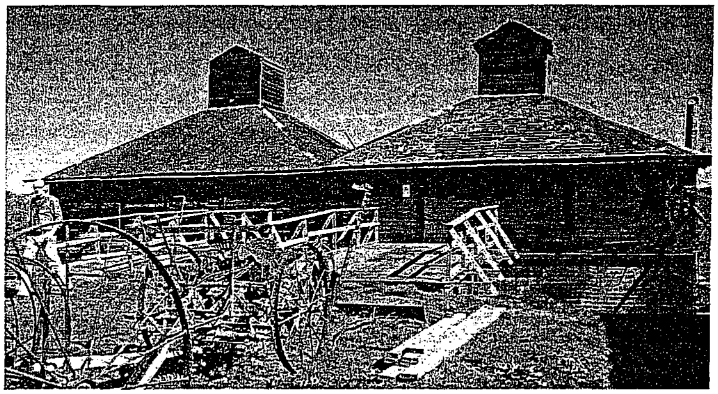
The subject buildings are set about 100 feet from the road in an open, grassy area between the road and the vineyards. A small wooded area along the road frontage begins adjacent to the subject buildings and extends 300-400 feet to the south. A driveway about 100 feet north of the Hop Kiln runs east through the parcel to the wooded river corridor. The Hop Kiln is about 100 feet north of the Baling Barn; the remnants of a wood Trestle that connected the buildings. A small, intermittent watercourse runs east-west between the two buildings. There are a number of other structures in the vicinity on the subject parcel, including a small shed adjacent to the southwest corner of the Hop Kiln, another, smaller shed adjacent to the southeast corner of the Baling Barn, a cottage east of the Hop Kiln, and a garage and a trailer north of the driveway.

The property covered in this report consists of two buildings: the double Hop Kiln and the Baling Barn, and the Trestle that originally connected them. This report covers their immediate setting as well, but not the rest of parcel 110-240-031-000 or any other buildings.

Hop Kiln

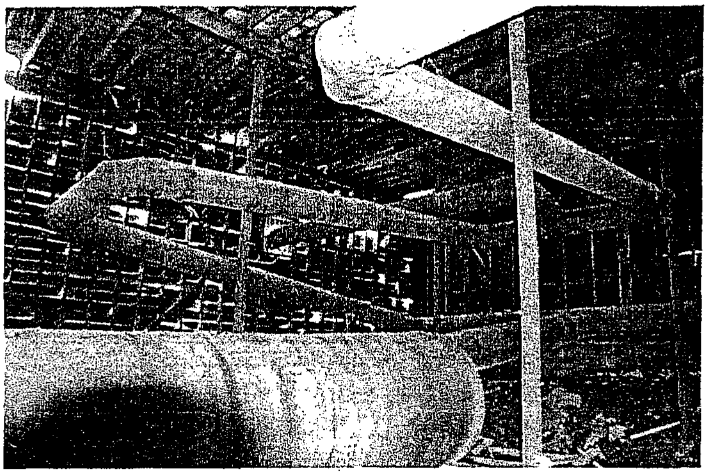
Exterior

The Hop Kiln is a wood building, with a rectangular footprint twice as long as its width. Its form is defined by its twin hip roofs, each square in plan and topped by a cupola-like ventilator with



Hop Kiln, looking east. Temporary wood bridges replace platform that originally connected drying rooms at upper level to grade in foreground.

its own small gabled roof. The building is set into the gently sloped terrain at the west side of the subject parcel, roughly one story taller on the east facade than on the west facade. On the east elevation, it has two small shed-roofed extensions, each centered on the hip roof above. The building is clad in horizontal, flat wood siding. The hip roof has asphalt composition shingle roofing, while the sheds on the east side have corrugated steel sheet roofing. West of the building, the grade slopes up very steeply toward Westside Road. The remains of a wood bridge from the west side of the top story of the building lead to the high point of the adjacent site about 15 to 20 feet west of the building. Below this bridge, there is a nearly flat area about 10 feet wide parallel to the building. The remnants of a rail line that connected to the Trestle between the Hop Kiln and the Baling Barn lie in this zone.



Lower level of Hop Kiln. Furnace is at lower left, with steel flue pipes winding through space to exterior at left rear. Note iron structural posts.

The Hop Kiln has relatively few openings, and no windows. Most of the west facade at the top story is occupied by four pairs of wide swinging doors faced in siding that matches the building walls. There are no openings on the west facade below these large doors. The north and south facades have no openings. On the east facade, there is a large sliding barn-style door on the south end of the east facade at the lower level of the building, a sliding barn door between the two one-story extensions, and another one on the north end. These doors are faced in vertical boards. The north extension has a wide opening on its north elevation and the south extension has a similar one on its south elevation; each extension has a wide door hinged at the top on its east elevation. The ventilators are solid on all four sides; the roofs are framed in panels that could be swung upward to open when the kiln was in operation and ventilation was required. The building has little detail or ornament on the exterior. There is a large horizontal ledger on the west facade, to which the framing of the remnant of the bridge is attached. A metal flue pipe exits the building slightly below the middle of the north facade and extends to just above the eave; a similar flue on the south facade that appears to be complete continues several feet above the eave where it terminates in a weather cap.

Interior

The Hop Kiln is a wood frame building set on a continuous concrete stem wall which is stepped as the grade it is set on rises to the west. It has balloon framing, with the horizontal exterior siding nailed directly to the studs without other sheathing or building paper. There is diagonal cross-bracing between the studs. Beams running east-west support the floor joists; iron posts set on concrete bases support the beams at the third points of their spans. The hip roofs are framed with rafter spacing matching the wall stud spacing; the wood roof shingles are nailed directly to the wood skip sheathing without roofing felt.

Like the roof form, the interior of the Hop Kiln is divided into two identical halves. It consists of fives spaces. At the ground level, there is a room inside each of the shed extensions on the east side of the building. These rooms are devoid of features or equipment other than the face of the steel furnace and its attached burner-blower machine. The east wall of the main mass of the Hop Kiln is faced in corrugated steel sheeting, forming the west wall of the rooms in the east

Leadership

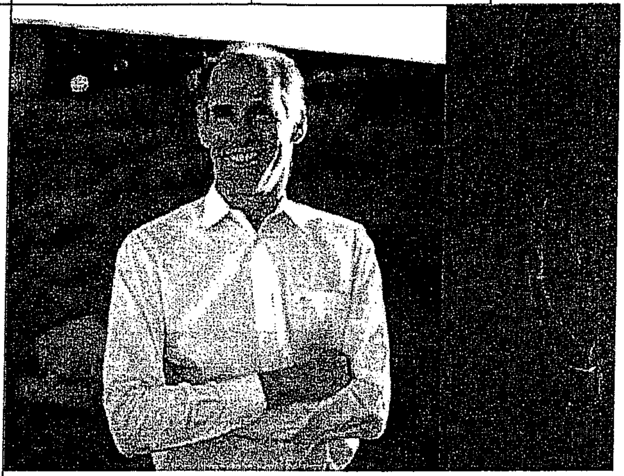
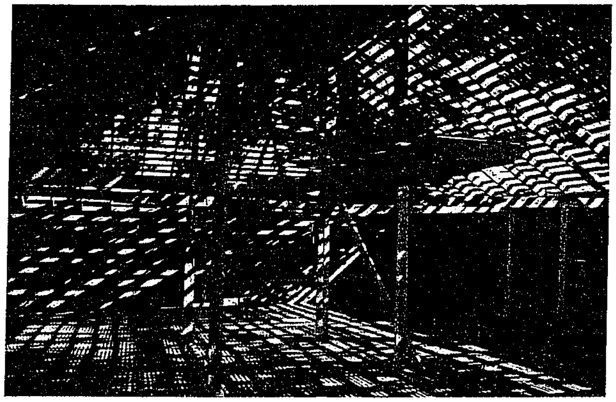
Frederic Knapp has 25 years of experience in architecture and historic preservation. Registered to practice architecture in California and Arizona, he has worked in all phases of architectural practice, from pre-design and programming to post-occupancy and forensic investigation. Frederic Knapp meets the Secretary of the Interior's Professional Qualification Standards for Architecture and Historic Architecture. In addition to preparing architectural documents for preservation projects conforming to the Secretary of the Interior's Standards for the Treatment of Historic Resources, he has prepared feasibility studies, historic structure reports, National Register nominations, federal historic preservation tax credit applications, and evaluations under review processes such as NEPA, CEQA, Section 106 of the National Historic Preservation Act, and local preservation ordinances.

Mr.Knapp is a published author. In 1995 he published Hotel Renovation Planning and Design (McGraw-Hill). He has given numerous presentations at conferences and seminars, including the California Preservation Foundation, the National Trust for Historic Preservation, the Society of Architectural Historians, and San Francisco Architectural Heritage.



extensions. The round steel furnace protrudes slightly from this wall; it is about five feet in diameter and begins about one foot above grade. The space has a dirt floor that is continuous with the exterior grade; there is no threshold at the wide exterior opening. These spaces appear to be much larger than necessary for housing only the existing equipment, but would have accommodated a wood supply when the Hop Kiln was wood-fired.



Drying room interior.

The lower level of the main building mass consists of a single space. Its function was to heat the air which flowed up into the drying rooms above. There is no stair between the lower lever and the drying rooms above. The dirt grade in the lower level rises at virtually the same angle found around the exterior. The wall framing is open at the lower level, with the exterior horizontal siding forming the enclosure of the space. Other than the building structure, the only features in the lower space are the iron furnace and its steel flue. The furnace is a horizontal cylinder about five feet in diameter, extending from the east wall of the space about one third of the way toward the west wall; it is set on poured concrete footings spaced along its length. The furnace appears to have been fabricated from multiple segments, with rings of rivets at the joints between them. The furnace, which appears to be lined in fire brick, acted as the fire box, and also had a substantial surface area so it would have warmed the air in the space directly. The flue, which is about one third the diameter of the furnace, winds circuitously through the lower level space, slowly rising to where it exits through the north (and south, on the opposite side) facade of the building.

The upper level consists of two identical drying rooms. These spaces are most notable for their floors, which consist of 2X boards set on their sides and separated from one another by 1X spacers, with the opening between the 2X boards allowing hot air from the lower space to rise into the drying room. The walls of the drying room are horizontal boards; the ceilings consist of the open roof framing. At the north drying room, where the exterior horizontal siding is missing on the east facade a layer of light colored paper or cloth is visible between the studs and the horizontal interior wall finish of the drying room. This paper or cloth is not visible at the numerous locations where the exterior siding is missing at the south drying room. At the bottom of the cupola-like ventilator, there is a wood cowl and electric motor for a fan; the fan blade is missing.

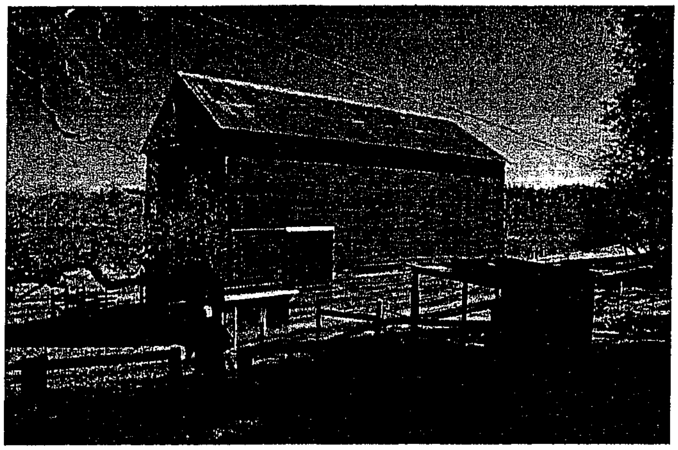
Condition

The Hop Kiln is in poor condition overall. While most of its framing appears to be intact, the roofing is heavily deteriorated and significant amounts of it are missing entirely. There are substantial areas where the exterior siding is also missing. The building does not appear to have been painted for decades. This assessment is based on briefly visual observation and does not reflect a structural engineer's evaluation. The only building system observed was limited electrical infrastructure, which was not assessed but appears to be decades old.

Bailing Barn

Exterior

The Baling Barn is a wood-frame, gable-roofed building, similar in general appearance to a barn or other agricultural structure, although it was built to accommodate specific parts of the hops production process. It would have been referred to traditionally as a hop house, but has been named the Baling Barn on the subject site. It appears to have house all the operations in hops production that followed the drying process that occurred in the Hop Kiln. The building is rectan-



Baling Barn, looking southeast.

gular in footprint, with an extension on the east side. The ridge of its gable roof runs on the long north-south axis of the building; the eastern extension has a shed roof that matches the pitch of the main gable roof and begins a few feet below the eave of the main roof. The Baling Barn is set on a nearly flat site, surrounded by low grass.

The Baling Barn is clad in horizontal wood drop siding. The extension is clad in flat horizontal siding, smaller than the boards on the main part of the building. Like the Hop Kiln, it has red paint that is heavily weathered. Like the Hop Kiln, the Baling Barn has few openings, and only one window. Within the triangular gable portion at the top of the north facade is a wide opening with two wood doors, hinged at the sides. The Trestle originally ran to this door; the steel track and rail car remain in the upper space of the Baling Barn. After the hops were dried in the Hop Kiln, they were loaded into the car and it was moved along the rails over the Trestle to the top of the Baling Barn where they could be cooled, baled, and stored. The north elevation of the Baling Barn has a wide door centered on its bottom level; the door is a sliding barn door with vertical wood boards. The south elevation is similar at the lower level; it also has a sliding barn door on the west end of the second level.

The north end of the east elevation of the Baling Barn has a wide door on the lower level similar to the one on the north elevation, and there is another door of the same type on the south end of the east elevation. The east extension has a wood door at the lower level of its east elevation that is hinged at the top like the ones on the two east extensions of the Hop Kiln. There is also a sliding barn door at each end of the second level of the east elevation. On the west elevation, there are similar barn doors at the the north end of the lower level and at just south of that point at the second level. The roofing on the Baling Barn is corrugated steel sheeting.

Interior
The Baling Barn has three interior levels, each a single, open space. There is a stair from the lower level to the second level, and a ladder from the second level to the top level. Like the Hop Kiln, it has stud walls in a balloon framing configuration, with floor joists running east-west. There are two lines of interior posts and beams running north-south at the third points of the building's width. In addition to reducing the span of the floor framing, these support the track at the top level for the car which carried the hops from the Hop Kiln to the Baling Barn. The wood boards of the upper two floors run the length of the building, supported by the floor joists which in turn are supported by the east and west walls and the two internal lines of posts and beams. Unlike the Hop Kiln, the roof framing of the Baling Barn consists widely spaced rafters that support purlins that run the length of the roof. The corrugated steel sheet roofing rests on the purlins.

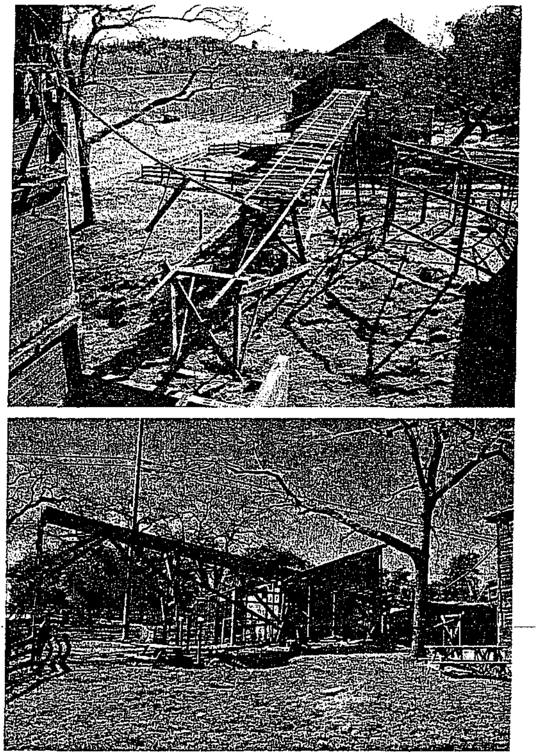
The lower level, which is only about eight or nine feet high, has round posts on the two interior structural lines. The floor is concrete. The walls have open framing. The baling machine is present in the east extension. An opening in the second floor allowed hops to be dropped into it from above.

The second level is similar to the lower level, but its ceiling is about twice as high. The interior structural lines have square wood posts on the second floor. The south wall of the second floor has a finish of wide horizontal wood boards; the other three exterior walls have open framing. Where the exterior siding is missing at the second floor level, the remnant of building paper is visible on the interior face of the studs, between them and the horizontal boards of the interior wall finish. A whitish substance which apparently was thermal insulation is visible at the bottom of some stud spaces. There is a long opening in the ceiling of the second level on the east side of the building; The second floor contains some items that appear related to hops production, including large wicker baskets, a wood frame with wires strung across it at regular intervals, and a triangular cart with steel wheels. A large, H-shaped table is framed on six of the structural posts in the center of the space.

The top level of the Baling Barn is low at the east and west walls, only about five feet high, but rises at the center because the roof framing is open like "cathedral" framing. The posts of the two interior structural framing lines stop at about the same level as the side walls; a series of transverse beams wider than the longitudinal interior framing lines sit atop the posts, supporting the rails for the hop cars. At the ends of these transverse beams are posts which support a girder running the length of the building on each side of the roof; these girders support the rafters at about midspan. The rail car remains on its rails at the top level of the building.

Trestle

This structure consists of open, heavy timber wood framing which forms a truss with a sloping top. The lateral framing units, or bents, have splayed legs an X-shaped cross-bracing in their upper panels. Between each of these lateral units, there are diagonal members on each side in a chevron form which provide intermediate support and bracing in the longitudinal direction. The top of the Trestle consists of three beams which support wood ties on which the steel rails for the hops car lie. Originally, the Trestle extended from the south end of of the Hop Kiln to the opening in the roof gable on the north end of the Baling Barn. Roughly half the Trestle is missing at the south end, and there is a gap where it approaches under the platform on the west side of the Hop Kiln. The remaining portion of the Trestle appears to be in very poor condition.

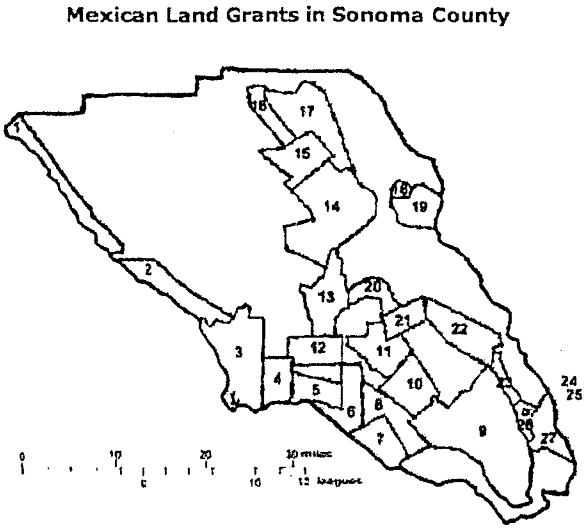


Trestle, above: looking south from Hop Kiln toward Baling Barn; below: looking northwest.

VI. Historical Context

A. Sonoma County

Before Spanish explorers, evangelists, soldiers, and colonists arrived in what is now called California, the descendants of much earlier immigrants from Asia had established stable societies over a period occupying nearly all the land in the state, including present-day Sonoma County. Although their customs, buildings, and diets varied, virtually all the indigenous occupants of California found food and supplies in close proximity to where they lived. The original inhabitants did not rely on food and other goods, natural resources, or specialized labor from distant sources, although they did trade on a smaller scale than the current economy of California. The native inhabitants' society was organized chiefly at the village level; although tribes or nations are now mapped as if they occupied discrete geographic portions of California, these groupings were not centrally organized and there was considerable variation from village to village. Ethnic designations today are chiefly based on language, but indigenous societies did not identify the same way current social organization is understood; today's names for native groups are mainly based on language, although people speaking a similar language did not necessarily follow the same cultural practices or share any political organization. The area now occupied by Sonoma County included people of the Pomo, Patwin, Mi Wuk, and Wappo groups, among others.[1] The Chocuyen people called the valley "Sonoma," meaning "valley of the Moon," and took it as their own name after Fr. Jose Altimira conflated the names for the people and the place.[2] By 1870, the census showed the county's native American population had dwindled to only 85.[3]



Land Grants in Sonoma County. Sotoyome is No. 14; Los Molinos is No. 13. Sonoma County Historical Society.

From its base in Latin America, Spain sent explorers, then armies and priests, and a number of colonists who mostly affected native populations living near the 21 missions the Spanish government and Roman Catholic Church established. Fr. Altimira founded Mission San Francisco Solano in Sonoma on 4 July 1823 at the site of the village of Huchi. The mission, which operated under Church control for only 11 years before Mexico secularized the missions, raised cattle, farmed grain, and cultivated produce.[4] The town of Sonoma, laid out under Spain's Law of the Indies based on urban planning principles that dated back to the Roman era, grew up around the mission and became the center of Mexican, Californio, and early American development of Sonoma County.

In addition to newcomers from Spain and Mexico, other important 19th century immigrants to Sonoma County included Russians who made incursions after Alexandr Andreyevich Baranov was put in charge of the Russian American Company's Alaska operations in 1791 and concluded that it required support installations further south because of its arctic climate. In 1812, Ivan Alexandrovich Kuskov sailed the Chirikov into Bodega Bay and established a temporary base he called Port Rumiantsev; he then chose Fort Ross for the permanent settlement, culminating three years of explorations. The following year, Kuskov brought 25 Russians and eight Aleuts to Fort Ross, completing a redwood stockade and establishing a commercial outpost and agricultural operation. The settlement grew in population and activity and expanded geographically over the next three decades with agricultural satellite operations to the south and the east.

The Russians elicited concern and resistance from the Spanish and Mexican governments, which did not recognize their right to colonize the area but were not able to force them out effectively from the limited power base in Sonoma and the distant installations in San Francisco and Monterey. Ultimately, the Fort Ross colony did not fulfill the Russian American Company's expectations and it decided in 1839 to sell it. Before leaving, the Russians made several thrusts inland to the east for agriculture and trade. The last Russian Commander at Fort Ross, Rotscheff, climbed the highest peak in the neighboring Mayacamas Mountains and named it St. Helena after his wife.[5]

By the time the Russians faded, other newcomers from the United States were making an impact along with immigrants from Europe and later Asia. Before the Gold Rush, some of the settlers who originally targeted the Oregon Trail veered south to establish farms on the advice of trappers and others who reported fertile land and a favorable climate in California. By 1845, 23 land grants had assigned almost half the area of Sonoma County to private owners, most of whom subdivided the land and sold it in turn as buyers materialized.[6]

In 1846, Sonoma was at the springboard of the Bear Flag Revolt. With the US and Mexico already at war and John Fremont poised on the border on a "topographical survey," a band of 33 armed Americans took the Mexican garrison in Sonoma by surprise on the morning of 16 June, capturing Gov. Vallejo and then imprisoning him at Sutter's fort in the Central Valley, where they had first gathered. At first they did not invoke American authority, fashioning the Bear Flag to represent their provisional government, but within days Fremont arrived in Sonoma and took command, followed by Admiral Sloat, who took the capital in Monterey within weeks. In less than a month, the Bear Flag came down in Sonoma and the American flag went up, completing the American takeover from Mexico.[7] Sonoma County remained under American military control until 1849. In August of that year, when the state constitutional convention set the county boundaries, representatives from Sonoma ensured that the Sonoma Valley not be included within the boundaries of Napa County.

An 1850 census put the county population at 561. The county election of 1851 designated a Court of Sessions to administer municipal government; it divided the county into townships including Mendocino township encompassing both the subject property and the present-day City of Healdsburg. Although outside settlement started in Sonoma, Santa Rosa outstripped it in development shortly after Statehood, and in 1854 the Legislature approved a referendum on moving the county seat, which was approved by the voters.[8] Americans had been migrating into California since the Spanish era, and assimilated into the Spanish and Mexican colonization process in many instances before they ultimately revolted in 1846, but after Statehood the migration accelerated.

While the Gold Rush famously brought immigrants from many countries to the Motherlode, large numbers also settled Sonoma County and other agricultural regions. The good soil and climate of the Sonoma Valley led to quick expansion of the farming begun under the Mission. The Russian River provided water to the fertile valley--sometimes in floods. The valley experienced floods in 1879, 1914, 1937, 1940, 1955, 1964, and 1986. In 1855, County Assessor Smith D. Towne reported that Sonoma County (which then included modern-day Mendocino County) had 12,233 acres cultivated in wheat, 3,268 in oats, 1,561 in barley, 714 in corn, 333 in peas and

beans, and 1,693 in potatoes. He counted 6,730 fruit trees from one to three years old, 24,800 vines, 26,250 head of cattle, 19,459 hogs, 7,065 sheep, and 4,958 horses.[9] The county held its first fair that year, and the first county courthouse was built the following year. County population grew to 11,867 by 1860 and to 38,480 in 1900.[10]

Count Agoston Haraszthy of Hungary is credited with bringing the first variety grape cuttings from Europe, starting Sonoma's wine industry in 1857, and by 1862, George Miller inaugurated wine-making in Healdsburg. The phylloxera infestation devastated California's vineyards in the 1870s, but by planting grafting European vines onto rootstock native to the Americas, California growers were able to rebound against the aphid-like pest native to the US which had also ravaged European vineyards. In the 1980s, researchers from UC Davis identified a new biotype which was able to feed on some native rootstocks.[11] By 1900, the county had 69 wineries, producing the most of any county in the state. As Prohibition loomed, the industry grew from 21,000 acres of vineyards in 1900 doubling to 42,000 in 1920 with 250 wineries.[12] Although Prohibition decimated wine-making, the county was derided along with Napa county as one of the greatest centers of bootlegging by a state legislator. Julio Gallo began buying Sonoma County grapes in the 1930s and his son Bob started Gallo Sonoma in Healdsburg, producing high-end wine. By the end of Prohibition, the county had only 70 wineries, rebounding strongly only in the 1960s. Vineyards declined to less than 10,000 acres in 1940.

Sonoma County attracted immigrants from outside the U.S., recording 51 Chinese residents in 1860, "several hundred" in Sonoma in 1870 working 11-hour days for $1, and 125 in Santa Rosa in 1880--with racial hatred from some white residents causing many to leave the county in the 1880s. An Anti Chinese League in Santa Rosa sought "removal," and Santa Rosa's Congressman, Thomas J. Geary, was the author of an extension of the Chinese Exclusion Act in 1892, but several Chinatowns developed in Sebastopol in the 1880s. The gunshot deaths of Mr. and Mrs. Jesse Wickersham near Healdsburg in 1886 were popularly blamed on a missing Chinese cook. In the mid-1920s, the Ku Klux Klan displayed its activity and newspapers reported a Japanese-Caucasian "race riot" in Graton, and in the 1930s there was conflict between Caucasians and Filipinos in the apple orchards in the west county. In the 1870s, Ireland sent more emigrants to the county than any other country. Italians arrived in Occidental in the 1870s and 1880s to find work in lumber mills and stone quarries, and also went into the wine business, with Giuseppe and Pietro Simi of Healdsburg becoming major suppliers for the San Francisco market. The Italian Swiss Colony winery founded in Asti in 1881 accompanied an immigrant community of the same name and Santa Rosa had a Little Italy the following year. In 1923, the Kawaoka family unsuccessfully sued to overturn the California Alien Land Law intended to inhibit Asian immigrants from leaving landholdings to their children and Judge Ross Campbell ruled for the first time in California that apartment owners could refuse to rent to African-Americans. German POWs were housed at a vacant migrant labor camp in Windsor, hired out to local farmers during the wartime labor shortage. The county's chapter of the NAACP formed in 1954.[13]

By 1920, the county population reached 52,000, with the economy still dominated by agriculture, putting the county at eighth in the nation in production. In addition to wine, the county produced

eggs, hope, prunes, and apples; these were joined by livestock and dairy industries. The county's markets included Europe by this time. Although Petaluma promoted itself as the "Egg Capital of the World," it lobbied the federal government to levy tariffs on cheaper eggs from China. In 1930, county population rose to 62,000 with farms increasing from 5,700 to 6,000 in the decade. In 1940, county population hit 69,250 despite the losses of the Depression and Prohibition, and surged to 103,405 in 1950. In 1950, the county's first high-tech operation, Optical Coating Lab (OCLI) opened in Santa Rosa, and developer Hugh Codding began building tracts, developments that heralded the transition of the county away from its agricultural past.[14]

B. Healdsburg

By the time the final 27 Mexican land grants in Sonoma County were complete, the area now covered by the City of Healdsburg had been included in the Sotoyome land grant, although the subject property lay just outside it. Also in the immediate vicinity was the Molino grant, just across the Russian River from the subject property. Just before the Gold Rush, only a few Anglos had settled around the Healdsburg area, but soon after the Gold Rush many more came, the first being Harmon Heald, who purchased the land in the Sotoyome grant of H. D. Fitch, one of the pre-Gold-Rush pioneers.[15] In 1857, Harmon Heald laid out Healdsburg Plaza, with the settlement's population at 300, and the town held its first agricultural fair the next year.[16] The post office name was changed from Russian River to Healdsburg; Heald started a store with H. M. Wilson and a hotel with a partner named Harris. The next year, with a population of 500, the town had two brick stores, an academy building with a capacity of 125, a fire company, and Masonic and Sons of Temperance halls, 25 business buildings and 120 houses. Its early development was limited by title disputes between speculators who had bought Spanish titles to land and squatters who had moved onto parcels and improved them; ultimately the title-holders agreed finance the transfer to the occupants.[17] The town developed enough to have its own department store, Rosenberg & Bush, founded by Wolfe Rosenberg in 1865. Two years later, Jerome Smith opened Smith Bank, Healdsburg's first, the same year Healdsburg incorporated. By 1872, the San Francisco and Northwest Pacific railroad network had expanded past Santa Rosa through Healdsburg to Cloverdale (service which is to be restored by the SMART network almost 150 years later).[18]

school which graduated eight girls and one boy in 1891. Another high school was completed in 1954. In 1888, the city gained a theater; Truitt's Theater hosted dances, concerts, and lectures as well as plays. By the turn of the 20th century, Healdsburg's main crops were hops, grapes and prunes. While railroad service had connected Healdsburg to the population center of the county for more than 40 years, the Santa Rosa-Healdsburg route was first paved in 1914. The 101 freeway reached Healdsburg only in 1964.[19]

Healdsburg's rapid development after its relatively early founding among post-Gold-Rush towns was ascribed primarily to the agricultural potential of its setting. "Nothing can surpass the fertility of the soil of Russian River and Dry Creek Valleys...maintained nearly at its maximum by the annual overflow of the streams, which brings down a rich alluvial mold," according to an early account.[20] Early farms ranged in size from 20 to 100 acres, putting the subject parcel, as shown on 19th century maps, close to the norm. An 1876 inventory of the town's production included 6,700 boxes of grapes, 138,600 pounds of dried fruit, 223,130 pounds of fresh fruit and vegetables, 1,245 tons of grain, as well as 252 cars of livestock, 69,700 pounds of hides and tallow and 148.867 pounds of wool. Non-agricultural production included 322 flasks of quicksilver, 80,000 pounds of tan bark, and 187,500 feet of lumber.[21]

C. Hops Industry

Growing and Picking Hops

Ale was originally made without hops, while beer was the name for the same drink made with the added ingredient of hops, a plant said to have originated in Egypt.[22] The flower of the hops plant, scientific name *Humulus lupulus*, is used to counter the sweet ingredients of beer with its bitter, astringent taste. The blossom of the female hop plant, which measures about 1-1/2" in diameter and is called a "cone" for its shape, is made up of scales or bracts growing from a stem. The unfertilized cone is used in hop-making today. A yellow, granular secretion called lupulin which forms on the surface of the bracts provides the flavor sought by brewers.[23] Sonoma county hops traditionally were "seeded," by growing a male vine in each row of female plants.[24]

fornia was devised.[25] The trellis system consists of rows seven to eight feet apart, with vines trained on strings, hung from wires spanning poles that are set up in the field annually, allowing the vines to grow to a height of 15-20 feet. Although the vines are now harvested intact and processed centrally by machine, during the decades in which the subject property was built and used, the cones were picked by hand from the vines. Pickers pulled the vines, removed the hops, and placed the hops in baskets, emptying the full baskets into sacks.[26] The burlap sacks weighed 75-80 pounds each.[27] Pickers wore full sleeves and pants to reduce scratches from the vines.[28] Horse-drawn wagons or trucks took the hops from the field to the kiln.

Hops must be dried so that they can be stored until used in brewing. Originally, the cones were air-dried but this method was not practical for large-scale production. American hop production was originally influenced by practice in Britain, where oast houses were devised to dry hops. These brick buildings contained three rooms: one for storage of green hops, in the center an oast room (oast is derived from an Indo-European word that means "burn") with a brick heating oven with a floor of lath strips about two and a half feet above it in which the hops were dried, and a cooling room.[29]

Hops, picked with a moisture content of 75%, must be dried to a content of 10-14% to keep them from spoiling.[30] Hop sacks were emptied onto the drying floor of the kiln to a depth of 18 to 36 inches, where they were heated for 8-20 hours. Workers used wood rakes to circulate the hops on the drying floor so they would heat evenly; sulfur was added to bleach the hops. The floor consisted of lath strips with spacers that allowed warm air from below to circulate. A thin cloth over the lath prevented the hops from falling through the gaps in the floor. Once the hops reached the correct moisture level, they were moved to a cooling room, and then to the baling press. The bales, about 18 by 24 inches and five feet long, weighed 200 pounds. Buyers sam-

pled a six-by-ten-inch sample cut from every tenth bale to ensure consistent quality, smelling for mold and judging whether the color was correct. [31]

Hops are picked during a season that typically lasts three to four weeks, usually beginning in late August.[32] In hop-growing regions, this typically meant a substantial amount of labor was required during a concentrated period, even though wages were low. Growers established camps for the pickers, many of whom returned annually and socialized after each day's long work. Some migrants spent the season in campgrounds on the Russian River.[33] Locally, pickers included ranch hands, Pomo Indians from Mendocino County or the coast, San Francisco longshoremen, immigrant groups from Italy, Mexico, Japan and Germany -- and even German POWs during World War II.[34] In 1894, the *Sonoma County* Tribune reported that 50 Native Americans had arrived on wagons and horseback, beckoned from Mendocino County to pick in Sonoma County because "the majority of the hop plantations up there are not going to be picked."[35] A 1928 newspaper article set the harvest labor requirement for Healdsburg at 2,500 and explained that much same labor pool would pick in Mendocino County and the Central Valley before coming to Healdsburg, where the work paid 1 cent per pound[36] -- and did not exceed 1-1/2 cents through the in1930s.[37] The low pay and migratory nature of the work led to social tensions and labor disputes, the most famous of which, the Wheatland Hop Riot, occurred at the Durst Ranch in the Sacramento Valley in 1913. Four people lost their lives during a strike organized by the International Workers of the World.[38] Although the hops industry made growers and the brokers to whom they sold their crops (often several years in advance) wealthy, it was a very unpredictable business because prices were global, set by distant harvests.[39] In 1881, the price was $1.10 per pound, but in 1885, it declined to $0.06 per pound.[40]

Hops in Sonoma County

Hops have been grown in a limited number of regions--which were widely dispersed in the United States, Europe, and China.[41] The plant was introduced to North America by English colonists, but commercial production began in New England after the Revolutionary War. New York was the leading producer by the mid-1840s, with Michigan and Wisconsin also developing significant hops production, but the West dominated during the 20th century.[42] (Hops are also native to North America, but only cultivated hops have figured significantly in brewing.[43])

Wilson Flint, a New Hampshire native who came to California in 1849, is said to have introduced hops roots to the state from Vermont in the winter of 1855-1856.[44] Amasa Bushnell, who had in 1856 planted 10 acres of hops in San Mateo County with roots he brought from the East,[45] introduced roots when he came to Green Valley on the Russian River in 1858 and went into partnership with Otis Allen of Sebastopol, growing 1,000 pounds that year. But local production did not gather significant momentum until the 1870s.[46] While large farms in the Sacramento and Livermore valleys equalled the largest producers in the Midwest and East, the hillier topography of Sonoma and Mendocino Counties limited the size of farms.[47]

Among the trends that affected hop production in Sonoma County or beyond were the importance of the international market, a factor documented from the early 18th century[48] which dominated the American industry by World War I,[49] the transition from manual to mechanized harvesting with a machine invented by two Sonoma county men, Joe and Florian Dauenhauer,[50] pests and blights, and Prohibition. (A lease recorded at the County shows that the Dauenhauer machine was used on the subject property in the 1950s. See Appendix 6.) While California eluded pest infestations that beset other hop-producing regions as late as 1891,[51] the introduction of nitrate fertilizers after World War II in an effort to find a peacetime use for chemical plants originally built to produce munitions made the soil of Sonoma County hospitable to the growth of downy mildew, decimating hops.[52] In the Northwest, the annual freeze killed this blight, compounding the advantage the larger farms there drew from mechanized harvesting. By 1916, three years before the Constitution was amended to extend Prohibition nationwide, 23 states

had already adopted local bans.[53] Hop growers were limited to the export market until the 21st Amendment ended Prohibition in 1933. World War II brought two developments favorable to American producers: European production was disrupted by combat, and the U.S. War Department commissioned beer production to maintain troop morale[54]--but both these factors were temporary, and prices fell after the war.[55] A final influence that challenged the domestic hops market until relatively recently was the change in American tastes during the 20th Century. One local veteran of the hops world, Walt Tischer, blamed Rosie the Riveter, explaining that after wartime factory work, more women began drinking beer, but they preferred lighter lagers and brewers decreased their use of hops in response.[56]

California led all other states in hop production from 1915 to 1922, with its acreage in production peaking in 1916.[57] The Northwest was already becoming a leader, with Oregon the top-producing state from 1905 to 1915 and from 1922 to 1943, when Washington assumed dominance.[58] Sonoma County had 150 acres in hops in 1877, and 2,300 in 1915 producing an average of eight bales per acre. By weight, the production in a mature field was 1,500 - 2,000 pounds per acre annually. In 1913, the county produced almost half of California's hops output; the Healdsburg area accounted for about one third of the county's production. County hops acreage peaked at 2,600 and was estimated by Tischer to account for 15 percent of overall agricultural production, declining to 1,500 acres in 1932. World War II saw a spike in hops production.[59] Sonoma was one of only three in California with a nationally significant level of hop production in the late 1930s.[60] By 1960, the county had only two hops growers, Alex Vescova and Pete Bussman.

D.Hop Kilns and Barns

British practice strongly influenced American architecture for hop production, though practices in other countries also played a role and Americans also devised their own designs and building practices. A 16th century publication documented a three-room masonry structure that continued in use in Britain through the 18th

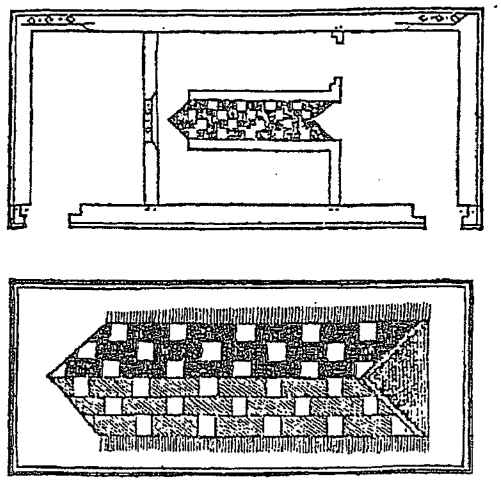
century.[61] In the 19th century, British hop kilns (where hops are dried) and hop houses (buildings incorporating rooms for cooling, baling, and storage as well as drying) evolved with larger buildings and different fuels and construction details for the furnace.[62]



Plan diagram, c 1574, of hop house in Kent, England (above) and detail of brick oast furnace (below) showing "checkerboard" brick pattern that increased surface area for heating air. Tomlan, from Scot, Reynold, *A Perfite Platforme of a Hoppe Garden*, 1574, reprinted New

Although some early American hop kilns were constructed of masonry and used open furnaces to dry the hops (usually introducing issues of the effect the combustion gases on the hops), the trend in America was to buildings of wood with masonry, or somewhat later, iron or steel heating apparatus. In America, the easy abundance and low cost of wood, or charcoal made from wood, eliminated challenges that fuel posed to British hop farmers. While a description from the 1830s of a Massachusetts kiln documented the practice of building the structure into the side of a hill so that the furnace was accessible from below and the drying floor from the uphill side, the only mention of a roof was that it "would be a further improvement."[63] While ventilation to dissipate the moisture from the hops was essential to successful operation of an enclosed kiln, American practice quickly evolved to roofed kilns, which retained heat better than an open drying floor and also provided protection from rain. The hip roof form associated with hop kilns in the West was said to have been introduced in New York around 1850; it takes advantage of the stack effect to induce a draft from the furnace below, through the drying floor, at out the open cupola. Although there are examples of round hop kilns in the East and Midwest, this form did not take hold in the West and ultimately faded from use.

Once they reach the necessary moisture level, hops must be cooled and then baled for shipping. In Britain and America, a variety of architectural solutions provided spaces for these operations, with associated sub-types of the hop house. The earliest approach, documented in Britain in the 16th century, was to build a simple, gabled structure and subdivide the interior.[64] The drying floor had to be separated from the furnace (especially where the fire was open) to avoid scorching the hops; this necessity, along with the construction of the firebox and flue (if used) and the benefit of the stack effect led to building forms for the kiln which were tall but compact in footprint. Although the cooling room needed some ventilation, it did not necessitate a specialized building form, nor did storage of the green hops or baling. As a result, many hop houses consisted of a kiln of specialized form and construction, and a more conventional, barn-like building for the other operations. Two other factors affected the building forms for hop kilns and hop houses: the short harvest season and fragile crop required that each farm process its annual output within about two weeks, making it desirable to keep the drying floor in continuous operation and thus putting a premium on easy of loading and unloading the kiln; and even with

---

[62] Tolman. P 160.

[63] Tolman. P 168.

[64] Tolman. P 160.

masonry construction, hop kilns were always vulnerable to building fires because their function was to heat a large quantity of hops to about 160 degrees F. for a long period.

Overall, these influences resulted in varying building forms in America with some common, though not universal, traits:

- The kiln itself was a compact, tall building form with a tapering roof profile
- The kiln form was not scalable; larger farms had multiple kilns instead of a larger, single kiln
- The kiln was set on a sloping site, providing access from grade to the furnace at the downhill side and the drying floor at the uphill side
- The cooling room, baling room, and store rooms were in a building form similar to a barn
- The kiln somewhat distinct from the rest of the hop house, though it was connected to it.
- Building forms and mechanical devices which allowed quick movement of the hops from one stage to the next increased output and could reduce fuel use.[65]

Although other construction materials continued in use, and experiments with new materials such as steel and concrete could be found, wood came to dominate construction of hop kilns and hop houses in the U.S. during the 19th century. Balloon framing became common for hop kilns, even in the East.[66] (Balloon framing was a structural technique introduced in the United States as industrial production of lumber and standardized use of wood framing instead of masonry influenced the growing construction industry. It frames the full height of a building's walls with continuous studs, nailing the framing for intermediate floors onto the side of the wall studs, instead of framing the walls at each level independently like interposed but independent blocks.)

Hop kilns at Wohler Ranch c 1940. Note trestle connecting kilns and hop house at right. Photo courtesy of Healdsburg Museum.

In Sonoma County, hop kilns like the subject building supplanted the earlier type that dominated in 1875 when the crop was introduced locally.[67] Daniel Flint (whose brother Wilson brought the first hop roots to California) built the first kiln in the state, a frame building erected by 1861. It had a brick furnace, with pipes that heated the air below the drying floor.[68] California practice was notable for continuing the developments begun in the Midwest to speed movement of hops, including the use of cars and trestles to move hops from the kiln to a cooling room in a separate building; it also experimented with a wire screen for the drying floor instead of wood lath, and multiple kilns were found on many hop farms.[69] In the 20th century, electric fans were introduced to ventilate kilns, and oil and gas replaced wood as the

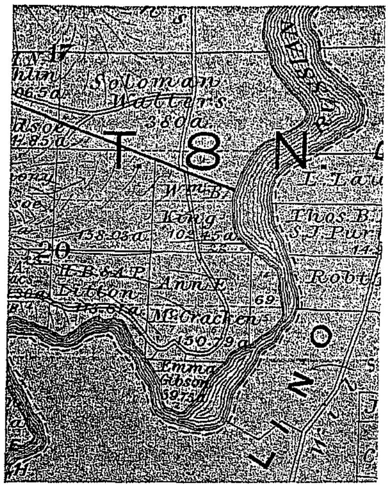
fuel for drying. After World War I, these and other developments led to a new design more similar to generic agricultural processing facilities than hip-roofed hop kilns of previous generations.

E. Site Ownership History

As early as 1877, the subject property was shown on early maps as part of larger parcel of land owned by J. McCracken, [70] and Ann E. McCracken in 1897. [71] The 1877 and 1897 maps both indicate a similar property outline comprising over 159 acres, surrounded by various adjacent properties and bounded at the southeast corner by the Russian River. The early maps appear to show a roadway passing through the property just west of where the subject property exists today running north to south, then curving to the west. Although Westside Road otherwise known as Guerneville Road runs a similar route as west property line of the subject property. [72]



1897 map, detail showing Ann McCracken as owner of subject parcel, with A.P. Litton adjacent owner. *Illustrated Atlast of Sonoma County, California.* Santa Rosa, Reynolds & Proctor. 1898. Healdsburg Museum.

Between 1897 and 1944, the ownership history is unclear. A.P. Litton owned the property adjacent to the one shown as belonging to Ann E. McCracken on the 1897 map and apparently acquired her land at some point after 1897 and before 1944, when he deeded it to C.S. Litton. After 1944, there are a limited number of owners listed in the list of ownership below.

In 1950, Cecil Litton leased a 100-foot-square portion of the property to Neil and Bruno Venturacci with Charles Knox for storing their hop-picking machine. The lease agreement notes a separate contract under which the Venturaccis and Knox were to pick Litton's crop. [73]

F. Owners

The 1900 U.S. Census for Mendocino Township lists Jasper McCracken as a farmer born in Missouri in 1833, married to Mary McCracken, born in 1850, also a native of Missouri. Their two daughters, Effie and Edna, born in 1877 and 1885 respectively, lived with them.

According to his obituary, Albert Perry Litton was born in Lineville, MO and died in Healdsburg at age 81 in 1944, having lived there all but eight years of his life. He ranched in Dry Creek Valley before moving to the West Side and lived with his son Cecil Litton for several years before his death.[74] The 1900 U.S. Census says Albert and Nellie W. Litton married in 1886. Nellie, a California native, was born in 1871.

Cecil Litton was born 17 April 1891 and died in Sonoma 10 September 1980.[75] Cecil Litton and Luella Litton lived in Whittier (Los Angeles County), where he was listed in the city directory as an electrician. The 1930 U.S. Census record shows Cecil Litton worked in the oil fields and Luella Litton had no employment outside the home. Luella Litton was an Iowa native whose parents were also Iowa natives; she and Cecil had married within a year of the census survey.[76] Cecil Litton served in the U.S. Army from 5 June 1917 to 21 December 1918.[77] His 1942 draft registration card lists his employment as a ranch in Healdsburg.[78]

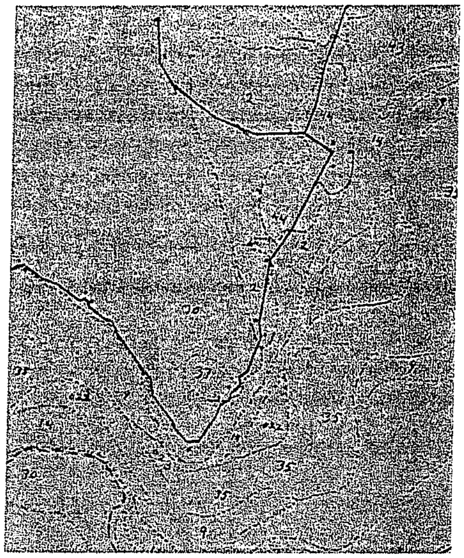
G. Construction History and Chronology

There is limited recorded development history of the property prior to 1978. The county does not have building permit records for the Hop Kiln or Baling Barn, and the assessor's records do not provide a construction date. Maps located in the research for this report do not provide strong evidence of the construction date of the subject buildings. Maps older than 1900 do not appear to note structures. A 1915 soils map of Healdsburg which appears to note the location of ranches or buildings with a dot does not indicate the subject buildings.[79]



1915 soils map of Healdsburg, detail. Arrow shows subject site. Dots appear to indicate buildings already present on nearby properties. Earth Sciences Map Library, UC Berkeley.

A Sonoma County tax roll for 1946-9 lists the "Hop Kilns" valued at $1,330, the "Hop Cooler" valued at $720, an unstated acreage of hops valued at $1,600 and 10 acres in two groups of trees valued at $820. It also lists other buildings and a small number of livestock, including a bull, cows, calves, and horses.[80] The Sonoma County Assessor's records, as of 1952, lists a "Double Hop Kiln," a "Platform" (the bridge on the west side of the Hop Kiln that provided access to the drying room doors at the top level of the building), the "Hop Cooler," and the "Tramway" ("high wood trestle & tracks," 170' by 6'). The "Year Built" column on the form is blank. This record notes "T&G wall in drying rooms" of the Hop Kiln, but describes the interior of the Baling Barn as "unf," apparently indicating that the assessor did not observe any interior wall finishes including the horizontal boards on the south side of the second level. In 1952, the condition of the buildings was noted as the following "% Good" in each case: Hop Kilns, 80%; Platform, 80%; Hop Cooler, 65%; Tramway 65%. The 1956 valuation update valuates all the buildings as 30% good, and the 1969 update maintains a 30% valuation for the "Hop Cooler" but marks the Hop Kilns, Tramway, Platform "NV" as having no value. As of March 21, 2014, the Assessor's records note two buildings on the site with an area of 1088 square feet.

A document dated January, 2000 provided by the previous owners, Ron and Pam Kaiser, to the current property owners states that the Hop Kiln, Baling Barn, Trestle, and shed west of the three subject structures (which it identifies as the storage shed for the hop picking machine) were built in 1948.[81] A similar document created five years earlier gives a 1948 construction date.[82] These documents do not state the basis for the construction dates and make no reference to any older buildings replaced by the construction in 1948 or 1949.

The Hop Kiln, Baling Barn, and Trestle operated as interdependent parts of a single system. While it is conceivable the Hop Kiln and Baling Barn could have been built at separate times

[80] Sonoma County tax records. Healdsburg Museum. See Appendix 4.

[81] *Property Highlights for 7097 Westside Road Healdsburg, CA 95448.* Unattriubuted, one-page document provided by David Ramey. Dated 1/7/00.

[82] *Structure Inventory and History 7097 Westside Road Healdsburg, CA 95448.* Unsigned two-page document apparently prepared by Ron and Pam Kaiser. Dated "As of April 29, 1995."

(with Trestle constructed with the second of the two buildings), it appears very likely all three were constructed at the same time. Based on the building conditions noted in the assessment records, it appears they were likely built by the early 1930s. The two buildings and Trestle would likely have been noted on the map if they were in place by 1915. On the basis of this information, it appears likely the subject buildings were constructed after 1915 and before the mid-1930s.

VII. Evaluation of Historical Status

A. California Register of Historical Resources

The subject property was evaluated to determine if it was individually eligible for listing in the California Register of Historical Resources. The California Register is an authoritative guide to significant architectural, archaeological, and historical resources in the State of California. Resources can be listed in the California Register through a number of methods. State Historical Landmarks and National Register-eligible properties (both listed and formal determinations of eligibility) are automatically listed. Properties can also be nominated to the California Register by local governments, private organizations, or citizens. This includes properties identified in historical resource surveys with Status Codes of 1 to 5 and resources designated as local landmarks or listed by city or county ordinance. The evaluative criteria used by the California Register for determining eligibility are closely based on those developed by the National Park Service for the National Register of Historic Places (National Register). In order to be eligible for listing in the California Register a property must be demonstrated to be significant under one or more of the following criteria:

> Criterion 1 (Event): Resources that are associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States.
>
> Criterion 2 (Person): Resources that are associated with the lives of persons important to local, California, or national history.
>
> Criterion 3 (Design/Construction): Resources that embody the distinctive characteristics of a type, period, region, or method of construction, or represent the work of a master, or possess high artistic values.
>
> Criterion 4 (Information Potential): Resources or sites that have yielded or have the potential to yield information important to the prehistory or history of the local area, California or the nation.

The following section examines the eligibility of the subject property for listing in the California Register under those criteria.

Criterion 1 (Events)

The Hop Kiln, Baling Barn, and Trestle appear to be significant under California Register Criterion 1 for their association with the hops industry; they appear to be significant at the local level. Although hops have been grown in countries spread widely over a number of continents and there are varieties native to North America, there have historically been only a limited number of major hop-producing regions in the world at any time. While hops were introduced to New England before the American Revolution and soon became an export crop, only a few American regions have had notable hops industries, chiefly New England, New York, a few Midwestern States, California, and the Northwest. California was the leading state in production of hops early in the 20th century, and was one of the top producers for a long period in the 19th and 20th centuries.

Amasa Bushnell brought hops roots to Sonoma County in 1858, during the period in which Americans settled the county and developed its agriculture following Statehood and the Gold Rush. In the heyday of its hops industry, Sonoma County accounted for almost half the output in the state and had up to 2,600 acres in production. From records available, it appears the subject property was built during the peak period of hops production in Sonoma County. The Hop Kiln, Trestle, and Baling Barn are readily identifiable as a complex built specifically for processing hops. Set in one of the prime agricultural zones of Sonoma County on the Russian River, they convey the historical significance of hops production in the county.

The property has already received informal recognition locally through publication, although it is not listed.[83] Other hop kilns have received formal designation, including Walters Ranch (National Register of Historic Places, California State Landmark) in Sonoma County. Because the subject property is limited in size and does not appear to have important and unusual features within the history of hops production, it does not appear to be significant at the state or national level.

Criterion 2 (Persons)

The property was owned and occupied by the Litton family, which was mentioned as one of the important hops producers in Healdsburg,[84] and was earlier owned by members of the McCracken family, early members of the agricultural community. Available documentation does not provide information demonstrating that these people were notably important to historical developments, however. For this reason, the subject property does not appear signfiicant under Criterion 2.

Criterion 3 (Design/Construction)

Hops are a small but important ingredient in brewing. The flower, or cone, of the female hop plant produces lupulin, which gives beer its distinctive--"hoppy"--taste. This flower is picked during a short period in late summer and has to be dried to a relatively precise moisture content. Hops have been traded internationally for centuries, and breweries and hops production were not geographically related, leading to a tradition of baling hops for storage and shipment,. Over the past four centuries, a specific architecture for hops processing facilities evolved in Western Europe and the United States. The Western states share many characteristics with the Midwest and East, but the later development of the hops industry here and differences in building materials and prevailing local construction techniques make the hop kilns and hop houses of California and the Northwest an identifiable sub-type of hops architecture.

The subject property appears to be a good example of a California hop kiln and hop house, with the trestle completing it as a processing complex that is representative of the era in which Sonoma County was most notable in hops production. The property appears eligible to the California Register under Criterion 3 at the local level. Its foremost feature is the twin hip roof forms of the Hop Kiln; while many other hop kilns do share this trait, it is not universal and gabled hop kilns are much less distinctive. The double-roof form further conveys the way construction tech-

---

[83] In their book *Historical Buildings of Sonoma County: A Pictorial Story of Yesterday's Rural Structures* (Penngrove, 3rd Wing Press. 1995) Jack Withington and Ron Parenti selected the subject property as one of three hop kilns in the county for photographic documentation (p 59).

[84] Djordjevich.

niques for hop processing responded to practical limitations where the volume of hops was too large for a single kiln. The subject property demonstrates several developments that were widespread in the period it was built, including a lower roof pitch on the kiln than previously was common (likely made possible by using of an electric fan in the ventilator), use of an all-iron furnace and flue pipes for heating, and the separate hop house connected to the kiln by a trestle.

Criterion 4 (Information Potential)

Criterion 4 applies primarily to archaeological resources, though also to properties with the potential to yield important information if observed or documented in more detail than is customarily possible in a typical building assessment. Archaeology is beyond the scope of this study. The two buildings and trestle are simply constructed, readily visible properties which do not have the potential to yield further information if approached with specialized devices or techniques. For this reason, the property does not appear eligible under Criterion 4.

B. Property Type

The California Register recognizes specific property types: buildings, structures, sites, objects, and districts. The Trestle is a structure because unlike the Hop Kiln and the Baling Barn (which are buildings), it cannot be occupied by humans. (Objects include statues, monuments, and other often non-functional entities.) A district is a grouping of related buildings, structures, sites, or objects which is significant in the aggregate even if the parts that make it up are not individually significant. The subject property was originally part of a complete farm where hops were both grown and processed. Today, the hop fields are vineyards and do not retain integrity as hop fields because the two are very different visually. For this reason, the property is not eligible as a district because it no longer conveys the indispensable hop-growing function the farm originally had. Thus, the Hop Kiln and Baling Barn are buildings under the California Register Criteria and the Trestle is a structure.

C. Integrity

In addition to being determined eligible under at least one of the four California Register criteria, a property must also retain sufficient historical integrity. The concept of integrity is essential to identifying the important physical characteristics of historical resources and hence, evaluating adverse change. For the purposes of the California Register, integrity is defined as "the authenticity of an historical resource's physical identity evidenced by the survival of characteristics that existed during the resource's period of significance" (California Code of Regulations Title 14, Chapter 11.5). A property is examined for seven variables or aspects that together comprise integrity. These aspects, which are based closely on the National Register, are location, design, setting, materials, workmanship, feeling and association. National Register Bulletin 15, How to Apply the National Register Criteria for Evaluation defines these seven characteristics:

- Location is the place where the historic property was constructed.
- Design is the combination of elements that create the form, plans, space, structure and style of the property.
- Setting addresses the physical environment of the historic property inclusive of the landscape and spatial relationships of the building/s.
- Materials refer to the physical elements that were combined or deposited during a particular period of time and in a particular pattern of configuration to form the historic property.

- Workmanship is the physical evidence of the crafts of a particular culture or people during any given period in history.
- Feeling is the property's expression of the aesthetic or historic sense of a particular period of time.
- Association is the direct link between an important historic event or person and a historic property.

According to *California Office of Historic Preservation Technical Assistance Series #6, "California Register and National Register: A Comparison:"*

> It is possible that historical resources may not retain sufficient integrity to meet the criteria for listing in the National Register, but they may still be eligible for listing in the California Register. A resource that has lost its historic character or appearance may still have sufficient integrity for the California Register if it maintains the potential to yield significant or historical information or specific data.

Thus, the California Register may include properties that have suffered a greater degree of damage to their integrity than would be acceptable for listing in the National Register.

The Hop Kiln, Baling Barn, and Trestle appear to have undergone few alterations. While the Hop Kiln in particular and also the Baling Barn are in poor condition, they retain the features most important to their association with hops production and the specialized construction techniques it engendered. Because a substantial part of the Trestle is missing, it does not retain integrity as an individual feature; but there is enough remaining so that its original configuration can still be understood. In summary, the overall property retains a very high degree of integrity of location, design, setting, feeling and association. Although the integrity of materials and workmanship are seriously diminished, the property still conveys how it was built and what it was made of. Overall, the subject property retains historical integrity and is eligible for listing in the California Register.

VIII. Evaluation of Project-Specific Impacts under CEQA

This section analyzes the project specific impacts of the proposed project on the environment as required by CEQA.

A. Project Description

The review of the proposed project was based upon conceptual drawings and computer renderings provided by the architect, Lundberg Design. This description is limited to the Hop Kiln, Baling Barn and Trestle and their immediate site. The other elements of the overall project are not described here, and would not cause an impact on the subject buildings.

The proposed project will retain the existing agricultural use and integrate certain facilities for a commercial winery. The Hop Kiln will be converted to a wine tasting room and the Baling Barn will be converted to a marketing center. Site work will include removal of most of the ancillary and outbuildings and construction of a gate, asphalt driveway, and parking lot.

Essentially retaining the existing grades, a new driveway from Westside Road and parking areas will be constructed arranged around the existing buildings. The paving will be a combination of asphalt paving from Westside Road, chip seal paving adjacent to the buildings, and gravel at overflow parking areas. The driveway is designed as a loop around a large, central landscaped island. The main drive will run at a slight southeast angle from Westside Road into the site and connect to a looped drive, which will run north to south past the wine tasting building (Hop Kiln) and adjacent marketing building (Baling Barn), accessing 26 parking stalls. From there, the drive curves east to access 52 overflow stalls. As the drive loops back to the west, it runs past a small overflow parking area at the north consisting of 43 stalls around a small landscaped island, and back to the west to connect to the main drive to Westside Road.

Hop Kiln

The proposed project for the Hop Kiln will retain a portion of the original Hop Kiln system as interpretive exhibit and provide new storage spaces, two tasting rooms, and a new stair and elevator. The main entry to the first level occurs at the east side of the building between a new stair and the south existing east extension.

The proposed interior plan retains the bilateral layout of the building, while inserting a circulation element with a stair on the east side and an elevator on the west side connected by an addition between them over the existing planes of the roof. The central interior area will serve as a circulation zone between the stair on the the east and the elevator on the west. The lower level at the south section will be remain double height space and will retain the iron furnace and flue pipes, with mechanical equipment at the east extension. The lower level at the north section will provide case storage with the north extension housing electrical and heating/ventilation/air-conditioning equipment. There will be a new level mezzanine in the north section, which will provide open storage and rooms for dry goods and office supplies.

On the upper floor there will be a tasting room at both the north and south section, each one delineated by sliding glazed wall systems, with an H-shaped circulation zone around them. At the corners of the building on the north side, there will be single-occupant toilet rooms. At the south corners there will be storage rooms. Both tasting rooms will have an island counter separating the larger tasting space from a kitchen or service bar. Custom shutters will be installed in the existing openings on the west side of the upper level which originally provided access to the drying room floor. Similar openings will be created on the east side, with the same type of shutters; these openings will have a glass guardrail. Two similar new openings with bi-folding doors and glass rails will be added at the south façade behind the service bar at the tasting room on that side of the building.

The exterior walls of the Hop Kiln will be clad in horizontal fiber cement ship lap siding, and the existing, deteriorated roof shingles will be replaced by corrugated Corten roofing. The new stair and elevator additions and the connection between them at the roof will be clad in weathered steel Corten panels. The chimney stack at the north façade will be replaced with a new stack to match the existing one; the stack on the south will be removed. The new stair on the east facade will have one glazed opening. The single main entry door and the double doors at the east extensions will be clad in siding to match the exterior wall. The main entry will be covered with a glass roof canopy, which stems the gap between the stair and the east extension. The exterior walls will be filled with insulation and finished to allow sections of the interior space to be conditioned.

Pedestrian Bridge

The remaining portion of the Trestle between the Hop Kiln and Baling Barn will be replaced with a new steel pedestrian bridge supported on wood posts set in concrete footings. The new bridge will be extend to the second story of the north façade of the Marketing building (Baling Barn), ending at a slightly lower point than the original Trestle did.

Baling Barn

The proposed project for the Baling Barn will retain the three levels and provide storage, open office space, and guest rooms. The north end of the building will function as circulation with a new stair at the north wall and a new elevator and toilet/storage room at each level. The main entry to the first level will occur at the north end of the east side of the building. There will be a new stair and ramp assembly from adjacent grade up to the lower level. The entry vestibule will provide access to the main stair, a small toilet room, and the elevator and its adjacent machine room. The main space occupying the southern two thirds of the lower floor will be for general storage. The second floor circulation scheme is similar to the lower floor; the rest of this floor will be open office space with a kitchen in the east extension. The office space will have a new open steel egress stair on the south facade. At the upper floor, the circulation core at the north and central lounge south of it will be open to the second floor along the east and west sides. The south end of the upper floor will have two guest sleeping rooms with private bathrooms. The original upper floor plate will be demolished and the new one constructed 1'-4" lower in the building in order to provide ample headroom throughout the upper level.

The exterior walls of the Baling Barn building will be clad in horizontal fiber cement ship lap siding and existing corrugated steel roofing will be replaced with corrugated Corten. A chimney stack to match the one at the Hop Kiln will be added to the east façade of the east extension. The new exterior entry and egress stair will be clad in steel Corten panels. New "window box" projections on the lower and second level will be constructed of Corten panels and a black anodized aluminum glazing system on the north, east, and west facades. The exterior walls will be filled with insulation and finished to allow sections of the interior space to be conditioned.

At the north façade, the existing first floor opening will be closed and finished in exterior cladding. The upper level opening for the pedestrian bridge will be have a new projecting box with a glazed entry door with sidelights. At the east façade, the existing openings at the north end of the façade will be modified for the new entry and second story window box. At the south end of the east façade, the existing first story opening will be covered with new siding and the existing second story opening will become a window box, modified to be centered between the east extension and the south end of the façade. At the south façade, the existing three openings will be covered with siding and the exterior egress stair will project from the second and first levels. The re will be small, square windows at the north and south walls of the east extension. Only the first floor opening at the north side of the east extension will be retaining and provided with a pair of swinging doors to match the finish siding at the walls. The top-hinged doors at the other first floor openings will be removed and the openings covered with new siding. At the east and west façades, a band of black anodized aluminum clerestory windows provide light and air to the upper story.

B. Status of Existing Property as a Historical Resource

The subject property is not listed as a historical resource in the official database maintained by the State of California[85] and is not a Sonoma County landmark (nor is it in a landmark district). It is outside the boundaries of the City of Healdsburg. As discussed above, the Hop Kiln, Baling Barn and Trestle appear individually eligible for listing in the California Register under Criteria 1 and 3. As such, the property would be treated a historical resource for the purposes of CEQA.

C. Determination of Significant Adverse Effect under CEQA

According to CEQA, a "project with an effect that may cause a substantial adverse change in the significance of a historic resource is a project that may have a significant effect on the environment."[86] Substantial adverse change is defined as: "physical demolition, destruction, re-

---

[85] Telephone statement by Annette Neal, California Historical Resources Information System Northwest Information Center, 7 April 2014.

[86] CEQA Guidelines subsection 15064.5(b).

location, or alteration of the resource or its immediate surroundings such that the significance of resource would be materially impaired."[87] The significance of an historical resource is materially impaired when a project "demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register...as determined by a lead agency for purposes of CEQA."[88] Thus, a project may alter a structure that is considered a historic resource but still not have a significant adverse effect on the environment as defined by CEQA as long as the alterations will not materially impair or undermine those physical characteristics the lead agency determines make the structure a historic resource to begin with. Since the subject buildings appear to be individual historic resources, the following section analyzes the potential impact of the proposed project.

D. Evaluation of the Project Under the Secretary of the Interior's Standards

The Secretary of the Interior's Standards for Rehabilitation & Illustrated Guidelines for Preserving, Rehabilitating, Restoring, & Reconstructing Historic Buildings (the Standards and the Guidelines, respectively) provide guidance for reviewing proposed work to historic properties.[89] The Standards are used by Federal, state, and local agencies in evaluating work on historic properties. Under the CEQA Guidelines, projects that comply with the Standards are presumed to have a less-than-significant effect.[90] Projects that do not comply with the Standards are evaluated to determine whether they would cause material impairment as described above.

The Secretary's Standards generally recommend identifying the features and materials important to the historical character of the property, and retaining and repairing them. Rehabilitation is the only one of the four Secretary's Standards treatments that allows for the construction of an addition or other alteration to accommodate a change in use.[91] This requires avoiding changes to the most important features and making changes so that the historic nature of the property remains readily visible. The Rehabilitation Standards recommend that new work to historic buildings be designed "in a manner that makes clear what is historic and what is new."[92] The Rehabilitation Standards recommend not "duplicating the exact form, material, style, and detailing of the historic building in a new addition so that the work appears to be part of the historic building."[93] The Rehabilitation Standards also differ from the other three treatments in that an

[87] CEQA Guidelines subsection 15064.5(b)(1).

[88] CEQA Guidelines subsection 15064.5(b)(2).

[89] U.S. Department of Interior National Park Service Cultural Resources, Preservation Assistance Division, *Secretary of the Interior's Standards for Rehabilitation & Illustrated Guidelines for Rehabilitating Historic Buildings, 1992*. The *Standards*, revised in 1992, were codified as 36 CFR Part 68.3 in the July 12, 1995 Federal Register (Vol. 60, No. 133). The revision replaces the 1978 and 1983 versions of 36 CFR 68 entitled *The Secretary of the Interior's Standards for Historic Preservation Projects*. The 36 CFR 68.3 *Standards* are applied to all grant-in-aid development projects assisted through the National Historic Preservation Fund. Another set of *Standards*, 36 CFR 67.7, focuses on "certified historic structures" as defined by the IRS Code of 1986. *The Standards* in 36 CFR 67.7 are used primarily when property owners are seeking certification for Federal tax benefits. The two sets of *Standards* vary slightly, but the differences are primarily technical and non-substantive in nature. The *Guidelines*, however, are *not* codified in the Federal Register.

[90] CEQA Guidelines subsection 15064.5(b)(3).

[91] Ibid., 63.

[92] Ibid., 112

[93] Ibid.

"assumption is made prior to work that existing historic fabric has become damaged or deteriorated over time and, as a result, more repair and replacement will be required."[94]

The first step in analyzing a project's compliance with the Rehabilitation Standards is to identify the property's character-defining features, including characteristics such as massing, materials, detailing, and spatial relationships. In regard to the Hop Kilns and Bailing Barn, the property's primary character-defining features are:

Hop Kiln
- Simple massing with double hip roof form and ventilators
- Wood siding and roofing
- Limited number of exterior openings
- Large interior spaces
- Platform and large doors on west facade
- Siting with slope to west and Trestle
- Drying room floor construction
- Furnace and flue pipes

Baling Barn
- Building form, including compact footprint and tall height
- Wood siding
- Limited number of exterior openings
- Large interior spaces
- Connection to Trestle
- Hops car

Trestle
- Wood construction technique and rails
- Location connecting buildings

Of secondary importance are:

Hop Kiln
- Open balloon framing
- Wall finish in drying room
- Lack of interior stairs
- East extensions

Baling Barn
- Open balloon framing and interior posts
- Baling machine and other interior features for hops processing
- Wall finish on south end of second level
- Opening which allowed movement of hops from top level to bottom during processing

The following analysis applies each of the Standards to the proposed project in more detail.

1. A property will be used as it was historically or be given a new use that requires minimal change to its distinctive materials, features, spaces, and spatial relationships.

---

[94] Kay D. Weeks and Anne E. Grimmer, U.S. Department of Interior National Park Service Cultural Resources, Preservation Assistance Division, *Secretary of the Interior's Standards for Rehabilitation and Illustrated Guidelines for Rehabilitating Historic Buildings* (Washington, D.C.: National Park Service, 1995), P 63.

The proposed use is appropriate under Standard 1. Rehabilitating it for long-term survival would be expensive for any use because of the heavy deterioration and extent of missing elements. The proposed use will allow retention of features and characteristics that would not be compatible with many potential uses.

2. The historic character of a property will be retained and preserved. The removal of distinctive materials or alteration of features, spaces, and spatial relationships that characterize a property will be avoided.

Most of the distinctive materials which characterize the property will be retained. The remnant of the Trestle will be removed, but the existing portion is incomplete and is in very poor condition. The proposed design preserves not only the distinctive spaces of the Hop Kiln, but also one furnace, a feature that would be extremely difficult to put into utilitarian service. The spatial relationships within the Hop Kiln will be emphasized by adding vertical circulation in readily identifiable additions instead of incorporating it within the original building. The new pedestrian walkway between the Hop Kiln and the Bailing Barn will recall the presence of the Trestle and convey the functional configuration of the property.

3. Each property will be recognized as a physical record of its time, place, and use. Changes that create a false sense of historical development, such as adding conjectural features or elements from other historic properties, will not be undertaken.

Nothing in the proposed design is intended to restore historic conditions based on speculation or conjecture, and the frankly contemporary materials and detailing of the new work will be readily identifiable.

4. Changes to a property that have acquired historic significance in their own right will be retained and preserved.

The property does not appear to have been altered; none of the proposed changes amounts to reversing a previous change.

5. Distinctive materials, features, finishes, and construction techniques or examples of craftsmanship that characterize a property will be preserved.

The proposed project will retain the massing, most of the wood framing, and one furnace in the Hop Kiln. Retention of features such as the furnace flue at the north hop kiln will allow the property to continue to convey its significance as a hop kiln - hop house complex. Although the upper floor plate of the Baling Barn is not a particularly distinctive feature, it is one architectonic element of the building fabric and it will be removed.

6. Deteriorated historic features will be repaired rather than replaced. Where the severity of deterioration requires replacement of a distinctive feature, the new feature will match the old in design, color, texture, and, where possible, materials. Replacement of missing features will be substantiated by documentary and physical evidence.

The wood siding will be replaced with a different material, but it will match the appearance of the original siding. The roofing on the Hop Kiln, which is partially missing, will be replaced with Corten, a contemporary material that is similar in color and gloss to wood shingles and similar in scale and construction detailing to corrugated sheet steel, a material found on the property although not used on the hip roofs of the Hop Kiln. The same material will be used on the Baling Barn, which already has corrugated sheet steel roofing.

The new pedestrian bridge will not match the Trestle in design or materials; while it would be possible to reconstruct the Trestle faithfully to its original condition, the result would be a feature useful only for carrying hops but unsafe and impractical for pedestrian use. The pedestrian bridge will accurately convey the location of the Trestle and the way it connected the Hop Kiln and Baling Barn. The use of contemporary materials and details will convey the fact that the feature is not original.

7. Chemical or physical treatments, if appropriate, will be undertaken using the gentlest means possible. Treatments that cause damage to historic materials will not be used.

The proposed project does not include use of chemical or abrasive treatments.

8. Archeological resources will be protected and preserved in place. If such resources must be disturbed, mitigation measures will be undertaken.

This report does not address archaeology.

9. New additions, exterior alterations, or related new construction will not destroy historic materials, features, and spatial relationships that characterize the property. The new work shall be differentiated from the old and will be compatible with the historic materials, features, size, scale and proportion, and massing to protect the integrity of the property and its environment.

The new elements, including windows, doors, canopies and interior partitions, will be simply detailed and constructed using modern, utilitarian materials that are visually distinct but compatible with the character of the original agricultural construction materials and techniques found on the Hop Kiln.

10. New additions and adjacent or related new construction will be undertaken in such a manner that, if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired.

The only significant proposed addition is the elevator and stair mass to be added to the Hop Kiln. It will be readily identifiable as an addition, and if it were removed, the historical spatial relationships of the interior would be restored. This addition eliminates the need to build an internal stair, allowing the historic portion of the building to remain two levels that are not connected vertically on the interior.

The proposed project would rebuilt a platform connecting the upper level of the Hop Kiln to the nearby grade to the west, restoring the historic primacy of entry to the building at this location. Although it would not be a reconstruction in the sense the word is used in the Secretary's Standards, it would maintain one of the most important spatial relationships of the property. (The small remaining portion of the platform is in very poor condition and cannot feasibly be repaired.)

The new work will also require limited removal of existing walls to create new openings, but some large wall areas will remain. Although future removal of the new window assemblies would not leave the the buildings literally as they are today, their essential form would be intact and openings could easily be infilled.

Summary--Secretary's Standards

The two most challenging issues in rehabilitating the property are retaining the distinctive spaces and relationships which characterize the property as a hops production complex and making use of the buildings without altering their light, open wood stud framing devoid of windows. The proposed design clearly succeeds in retaining important spaces and relationships, most notably by retaining unchanged one of the lower level spaces and furnaces in the Hop Kiln, by maintaining the spatial sense of the drying rooms and the second level of the Baling Barn, and by building the pedestrian bridge to convey the historic physical and functional connection between the Hop Kiln and Baling Barn.

Dealing with windows--and even doors--is much more challenging. Although the two buildings do have a number of doors, these are not ideally located. With no original glazed openings, the buildings cannot be heated and cooled without altering part of their historic character. The proposed design frankly announces the introduction of windows and doors without attempting to camouflage them as original in any way. Strict application of the Secretary's Standards might not allow this, but it should be kept in mind that the Secretary's Standards are intended only to guide rehabilitation in broad terms. If Standard 10 resulted in a prohibition on adding windows, it would raise the question of whether there is really any use for these specialized buildings.

Overall, the proposed project follows the direction of the Secretary's Standards to a great degree. It is particularly noteworthy for retaining one of the furnaces and both the drying room spaces in the Hop Kiln, for retaining the entire second level space open in the Baling Barn and limiting partitions on the other two levels, and for rebuilding the pedestrian bridge to regain the historic connection between the two buildings. Strict application of the Standards might not allow the introduction of windows needed for the proposed use, and might require leaving the top level of the Baling Barn in place. But such a strict, inflexible interpretation might discourage reuse of the building entirely, and would overlook degree to which the proposed design preserves the most important characteristics that distinguish the property.

E. Analysis of the Project-Specific Impacts under CEQA

The proposed design clearly conforms to the Secretary of the Interior's Standards in most respects as explained above. But there are a very small number of elements which may not conform, raising the question of whether the overall design can be classified as mitigated to a less than significant impact under CEQA Guidelines Section 15064.5 (b) (3). But even if this were not the case, the design would not have a significant impact on the environment under Section 15064.5 (b), paragraphs (1) and (2) (A) for the following reasons.

Under paragraph (1), in order to have a significant effect on the environment, the project would have to cause "substantial adverse change in the significance" of the property, which means alteration "such that the significance...would be materially impaired." Under paragraph (2) (A), the significance would be materially impaired if the project "Demolishes or materially alters in an adverse manner those physical characteristics...that convey its historical significance and that justify its eligibility for, inclusion in the California Register of Historical Resources." In some jurisdictions, this is determined simply by evaluating whether the property would remain eligible for the California Register if the project were executed; in other jurisdictions the evaluation looks at whether the important characteristics which exemplify the eligibility of the property would remain undiminished. The proposed project would be judged to have a less than significant effect on the environment under either evaluation.

The property is eligible to the California Register because it is a good example of a hop-processing complex. If the proposed project were executed, the property would continue to have the distinctive massing of the Hop Kiln, the furnace and flue of the kiln (which would be far more accessible to the public than in the past), large interior spaces in both buildings, traditional wood framing exposed on the interior in both buildings, and a physical connection between the buildings. These features would be adequate to convey the significance of the property, and it would retain historical integrity under the California Register Criteria, so the property would remain eligible.

The second approach typically used by some jurisdictions to test for material impairment, assessing changes to the most important characteristics, would look at the following features of the subject property: the form and massing of the Hop Kiln, the siting of the two buildings and the connection between them, the character of the building exteriors, specialized interior spaces, and hops-processing equipment/machinery. Of less importance, but also to be considered are: construction materials and techniques, interior finishes, detailed elements of the hops process such as the openings in the top floor of the Baling Barn, and the form and massing of the Baling Barn. The proposed project would make noteworthy changes *only* to the character of the building exteriors and the details of the hops process; the addition to the Hop Kiln is limited in size and compatible with the character of that building. Of paramount importance, it would retain the form and massing of both buildings, important interior spaces and features, and the siting and connection between the buildings. The important characteristics of the property that justify its eligibility to the California Register would not only be retained and rehabilitated, they would become accessible to the public for the first time. Thus, the project would not cause a material impairment of the significance of the property and would have a less than significant impact on historical resources under the CEQA Guidelines.

IX. Conclusion

Hops have for centuries been produced in a limited number of regions at any given time period. International trade in hops goes back centuries, and brewers and brokers concentrate the hops market, increasing the tendency for a limited number of regions to play a significant role in hops production. Hops must be dried very close to where they are grown, and once dried and baled they can be shipped to distant markets. Processing hops requires special facilities and procedures; for hundreds of years this has resulted in a specialized building type that has evolved from era to era and region to region.

After Statehood and the Gold Rush, Americans flocked to Sonoma County as they established agricultural operations in suitable parts of California. Amasa Bushnell brought hops roots to Sonoma County in 1858, and within 20 years hops became a significant crop in the county, remaining until the 1960s when the industry succumbed to downy mildew and economic competition from larger farms in the Northwest which could be harvested mechanically. The county still retains a number of hop kilns, the distinctive form of which conveys an important phase of agricultural heritage.

The Hop Kiln, Baling Barn and Trestle at 7097 Westside Road in Healdsburg were constructed to process hops grown on the ranch owned by the McCracken and Litton families. While no building permit records are available to document the construction date, the complex does not appear on a 1915 map and was noted as deteriorated on a 1952 tax roll, suggesting it was at least 20 years old at that time. This would put its likely construction date in the heyday of hops production in Sonoma County, an era in which California was one of the leading states in hops production and Sonoma County was an important center in the state. The two buildings are remarkably complete, although they are in poor condition. While much of the Trestle has been demolished, the remnant still marks the connection between the buildings. The Hop Kiln and Baling Barn appear to be eligible to the California Register under Criterion 1 for their association with hops production in Sonoma County and under Criterion 3 as examples of a specialized construction technique. Though it does not retain integrity individually, the Trestle would be eligible along with the two buildings under a multiple property submission. Because the adjacent fields where the hops grew historically are now vineyards, with a very different appearance, they do not retain integrity as a site of hops production and the subject property is not a historic district. Because the Hop Kiln, Baling Barn, and Trestle appear eligible to the California Register as a grouping of two buildings and a structure, they would be considered to be a historical resource for the purposes of CEQA even though they are not listed on any historical register.

The proposed project would renovate the two buildings and replace the existing remnant of the Trestle with a new steel pedestrian bridge connecting the buildings the same way the Trestle once did. A new addition would introduce stairs on the on the east and an elevator on the west side of the Hop Kiln and spanning its roof between the two historic hip roofs of the drying rooms. The addition would provide vertical circulation within the Hop Kiln without altering the historic interior. The project would introduce new finishes and partitions in many spaces of the two buildings, but would retain the historic open wood stud framing in selected interior spaces. New windows would be added to both buildings, which originally had almost no fenestration and no glazed window sash.

Because the property is a historical resource for the purposes of CEQA, the project must be evaluated to determine whether it would cause a significant impact on them. Under the CEQA Guidelines, projects that conform to the Secretary of the Interior's Standard for Rehabilitation are automatically treated as being mitigated to a less than significant impact. The proposed project would clearly conform to the Secretary of the Interior's Standards for Rehabilitation in almost all respects. In practice, many agencies and jurisdictions apply the Secretary's Standards somewhat holistically, taking into consideration both the overall effect on the historical resource and whether individual parts of the project meet all 10 Standards. Of particular note under such an approach, the proposed design would retain one of the furnaces in the Hop Kiln along with its flue pipe and double-height space. It would retain the spatial definition of the drying rooms and the second level of the Baling Barn, the largest of the historic spaces in that building. It would reconstruct the platform on the west side of the Hop Kiln and the physical connection between the two buildings -- both substantial undertakings not required under a by-the-book application of the Secretary's Standards. While the size and number of new windows in the two buildings might not conform to a strict interpretation of the Secretary's Standards, the new openings would have a simple, bold visual character compatible with the utilitarian nature of the property, and they would have custom shutters which could be closed to regain the monolithic quality the property would have had much of the year. The addition to the Hop Kiln, while readily visible, would be small in relationship to the historic building and would eliminate the need to introduce internal stairs and an elevator within a building that never had them.

Even if a reductive application of the Secretary's Standards were to conclude that the proposed design does not conform in every respect, the proposed project would have a less than significant impact under CEQA Guidelines Section 15064.5 (b) (1) and (2) (A) because it would retain the distinctive features which make the property eligible to the California Register. The property would retain historical integrity if the project were executed as proposed, and it would remain eligible to the California Register.

LAND LEASE AGREEMENT

THIS INDENTURE, made in the City of Santa Rosa, County of Sonoma, State of California, on the first day of February, 1950, by CECIL S. LITTON residing on the West Side Road near Healdsburg, California (herein called the "Lessor") and VENTURACCI and KNOX, a partnership consisting of Neil Venturacci, Bruno Venturacci and Charles Knox, doing business at 113 Ninth Street, Santa Rosa, California (herein called the "Lessee"), WITNESSETH:

A - WHEREAS, the Lessor is one of a group of hop growers in the vicinity of the Russian River south of Healdsburg, California; and

B - WHEREAS, the Lessor and the other hop growers who are his friends and neighbors are desirous of securing the services of a competent hop picker; and

C - WHEREAS, the Lessor has entered into a hop picking contract with the Lessee wherein the Lessee is to pick hops through the use of a hop picking machine; and

D - WHEREAS, the Lessee is the owner of, or has under its control, a Davenhauer hop picking machine; and

E - WHEREAS, it is necessary, as part of the successful operation of said machine, to construct a particular type of building to house it; and

F. - WHEREAS, it is necessary, in order that the Lessee may properly carry out the terms of the contract with the Lessor and his friends and neighbors for the picking of his hops, to maintain the said hop picking machine in a building near the places of operation of the picking of hops; and

G - WHEREAS, the Lessor is desirous of aiding and assisting his friends and neighbors with the respect to the harvesting of their respective hop crops; and

H --WHEREAS, the Lessor recognizes that if he is able to provide assistance to his friends and neighbors, as aforementioned, it will constitute a good and valuable consideration to him.

NOW, THEREFORE, it is mutually agreed as follows:

1 - That the Lessor shall lease to the Lessee an area of ground approximately 100 yards in length along the West Side Road and extending in depth away from the said West Side Road a distance of 100 yards, forming a rectangular area. The northerly boundary of the property shall commence on the West Side Road at a point about five hundred yards north of the Wohn residence, and the southerly boundary shall commence at a point on the said West Side

Response to Caltrans Comments on the "Traffic Study for the Ramey Winery"

Dear Mr. Ramey;

We are in receipt of comments from Caltrans on the traffic analysis prepared for the Ramey Winery project (UPE14-0008) as contained in a letter dated September 14, 2017 to Ms. Traci Tesconi from Ms. Patricia Maurice. As requested by Ms. Tesconi, the following information is provided in response to these comments. The Caltrans headings are provided along with a summary of comment for ease of review.

Operations Analysis

Caltrans indicated a concern about conflicts at the Westside Road interchange with US 101, and requests a traffic study that includes the trip generation and distribution. This information is available in the March 10, 2016, traffic study prepared for the project. Because the project generates fewer than 20 peak hour trips, analysis would only be required if the project affects a State facility that operates at LOS E or F. The section of US 101 north of Windsor is expected to operate acceptably under long-term future volumes in its current configuration according to the *Sonoma County GP 2020 Draft EIR*, therefore analysis of the project's potential impacts on this segment of the freeway is not warranted.

Travel Demand Analysis

Caltrans recommended that a VMT analysis be provided. However, the County has not yet established guidance for preparing a VMT analysis, nor have standards been adopted against which findings could be measured. Further, the guidance provided by the Office of Planning and Research is insufficient to address the trips generated by a winery. It is therefore premature to prepare a VMT analysis. It is noted that the potential safety issues as well as adequacy of facilities for pedestrians and bicyclists are addressed in the traffic study, as discussed in the final two bullets of this section of the comment letter.

Vehicle Trip Reduction

While the project is of insufficient size to establish a robust program for managing transportation demand, the applicant will be providing bicycle parking, which is one of the potential trip-reducing measures. Given the rural nature of the project and limited number of employees, implementation of any of the other typical Transportation Demand Management measures is infeasible.

Multimodal Planning

The project will have a driveway on Westside Road, which provides a connection to the proposed Class III bike route. No additional facilities are planned or proposed.

ATTACHMENT P

Traffic Impact Fees

The County has an established fee to mitigate traffic impacts by private development that it is assumed will be collected from the applicant.

Transportation Permit

Should there be a need for an oversized or excessive load vehicle to travel to the site, the appropriate permit will be required of the shipper.

We hope this information is adequate to address the Caltrans comments. Please feel free to contact me if there are any questions regarding this information or our conclusions. Thank you for giving us the opportunity to provide these services.

Sincerely,

Dalene J Whitlock

Dear Traci, 10-16-2014

On behalf of the members of the Sonoma County Bicycle and Pedestrian Advisory Committee (SCBPAC), thank you for the opportunity to review the proposed winery and public tasting room to be located at 7097 Westside Road in Healdsburg, project # UPE14-0008. Please accept the following comments on behalf of the SCBPAC.

As a condition of project approval, please require the installation of adequate bicycle racks near the entrance to the proposed public tasting rooms. Please reference the bicycle parking standards provided on pages 19 and 20 of the 2010 Sonoma County Bicycle and Pedestrian Plan, which can be found via the following link; http://www.sonoma-county.org/prmd/docs/misc/bikeplandraft.pdf. Additional bicycle parking guidelines are also provided by the Association of Pedestrian and Bicycle Professionals (APBP), which can be found online at the following website; http://www.apbp.org/resource/resmgr/publications/bicycle_parking_guidelines.pdf. Please note that the SCBPAC recommends the installation of inverted-U style bicycle racks.

Thanks again for the opportunity to comment on this project. I can be reached at 585-7516 should you have any questions.

Sincerely,

Steven Schmitz
SCBPAC Staff

Subject: **Wine Cave Data and Feasibility Report**
Ramey Wine Cellars
7097 Westside Road
Healdsburg, California

Dear Mr. Ramey:

As per your request, Condor Earth (Condor) reviewed our January 17, 2014 Tunnel Data and Feasibility Report, and updated project plans prepared by Lundberg Design, dated September 9, 2018. Condor has provided this feasibility update based on the current plans and project needs.

This report presents the results of an evaluation performed by Condor to provide subsurface data, and preliminary geotechnical engineering conclusions and recommendations for the design and construction of wine caves at Ramey Wine Cellars. Figure 1, Vicinity Map, shows the approximate site location.

SITE AND PROJECT DESCRIPTION

Figure 2, Site Plan, shows the proposed wine cave area and portals diagramically; refer to the current project plans for the proposed new wine cave layout. The proposed cave project will consist of constructing a 20,720 sf wine cave with three portals using entirely cut-and-cover methods. Note that our 2014 report included considerations for portions of the cave possibly being constructed using tunneling methods. The new cave will be designated as a Type 2 Winery Cave, per Section 446 of the California Building Code.

The portals will be located along a new winery building wall approximately 260 feet in length. The proposed caves will be 36 feet wide and 16 feet high. The rough cave area dimensions are 230 feet by 113 feet; the maximum travel distance from the back of the cave to the exterior of the adjacent building is approximately 235 feet. At the currently proposed portals, there is approximately a 9-foot elevation difference between the proposed finished floor (elevation ±113 feet) and the existing ground surface; at the back of the caves there is approximately a 20-foot elevation difference between the proposed finished floor and the existing ground surface. Soil material from the cave area cuts will be used as fill over the top of the cut-and-cover caves.

The cave area excavation will require cuts up to about 22 feet deep, which will be temporarily shored during construction. The cave structures will include cast-in-place foundations, stem walls and concrete slabs, and pre-cast tunnel arch segments.

If the project plans change and the geotechnical aspects of the project vary significantly from those described, then Condor should be notified and reevaluate our conclusions and recommendations in this report.

SCOPE OF WORK

Condor's scope of work was presented in our September 3, 2013 Proposal (Task 1 and 2) and consisted of the following:

- Investigated ground conditions by drilling four vertical borings to depths that extend to more than 10 feet below the level of the proposed tunnel floor at adjacent tunnel locations, and by excavating five test pits near the proposed shotcrete retaining wall.
- Installed a piezometer in boring B-3 to permit subsequent measurement of groundwater levels and monitoring of ground temperature (see Figure 2).
- Tested selected samples of soil and rock to measure relevant index and engineering properties.
- Prepared this report that presents the following:
  - Vicinity Map
  - Site Plan showing existing site topography, the proposed cave, approximate boring locations and approximate test pit locations
  - Boring and Test Pit Logs
  - Photographs of retrieved core
  - Laboratory test reports
  - Description of site geology and seismicity
  - Discussion of general surface and subsurface conditions, including groundwater
  - Preliminary conclusions regarding anticipated subsurface conditions to be exposed in proposed excavations for the wine cave and portals (and variability of such conditions), including rock structure, weathering, rock fracture, characteristics, rock unconfined compressive strength, rock hardness, and RQD.
  - Conclusions regarding geotechnical issues for design and construction, including the following:
    - Anticipated ground temperatures and cave operating temperatures (at various portions of the cave)
    - General tunnel ground characteristics (and variability depending on ground over and variation of rock characteristics)
    - Excavatability of rock
    - Potential for groundwater seepage and options for water seepage mitigation
    - Tunnel stability and unsupported stand-up time
    - Anticipated tunnel advance rates and requirements for temporary support
    - Estimated tunnel liner requirements

SITE AND SUBSURFACE INVESTIGATION METHODS

Condor investigated subsurface conditions at the site on November 4 and 5, 2013 by drilling four borings (B-1, B-2, B-3 and B-4) to depths of about 20, 33, 43 and 20 feet respectively. A track-mounted CME-55 drill rig and both auger and core drilling techniques were used.

A Condor staff geologist visually logged the earth materials encountered during drilling and directed the sampling of soil and rock. Five test pits were excavated on November 5, 2013 to depths of about 3 to 7 feet. Figure 2 shows the approximate boring and test pit locations. Boring and test pit logs with the descriptions

and classifications of rock properties are attached in Appendix A. Appendix B contains photographs of the core.

Soil samples were recovered with PQ core or with 3-inch outside diameter split-spoon samplers driven 18 inches (or to practical refusal) over three 6-inch increments. The split-spoon samplers were driven into the ground using a 140-pound hammer dropped 30 inches by an automatically tripped hammer system. The boring logs show, at the appropriate depths, the field blow counts for each 6-inch drive. When refusal occurred, the logs show the blows required to drive the sampler over the final increment, and the number of inches driven over this final increment. Condor visually classified soils using the Unified Soil Classification System and characterized the engineering properties of the rock. Condor delivered soil and rock samples to our laboratories (including subcontracted laboratories) for further examination and testing. We performed unconfined compressive strength, plasticity index and triaxial shear tests. Appendix C contains the laboratory test reports.

After drilling, B-1, B-2 and B-4 were backfilled with lean cement grout, and a piezometer (groundwater level monitoring well) was installed in B-3. Test pits were filled in with excavated material and tamped down with backhoe bucket.

SITE GEOLOGY

Available geologic maps indicate that rock in the project vicinity belongs to the Franciscan Complex Mélange dating approximately late Cretaceous to Early Jurassic. This unit includes dominantly metamorphosed rocks, including greywacke, shale and serpentinite. The project site is mapped within the Franciscan Central Belt mélange, designated "KJfm" on Figure 3, Geologic Map. The subsurface data indicates that the Franciscan Mélange at the site is serpentinite. Although Figure 4, Ultramafic Map, does not indicate that there is ultramafic rock at this project site, it was encountered during drilling.

The Subsurface Conditions section of this report presents additional information.

SITE SEISMICITY

This site is located in a seismically active area of California in an area of regional faulting. Figure 5, Regional Fault Map, shows that the nearest active fault (Rodgers Creek Fault) is about 5.5 miles from the project site. The site is also about 3.5 miles away from a potentially active fault, special study zone according to the Healdsburg Quadrangle map from the website of Department of Conservation, California (http://www.quake.ca.gov/ gmaps/WH/regulatorymaps.htm). Because the site is not located near any active faults, Condor concludes that the risk of surface rupture from faulting is considered low.

SITE CONDITIONS

The pertinent aspects of the site conditions are shown on Figure 2. The proposed caves occupy a hillside sloping to the northeast from an existing vineyard down to a pond and buildings. The ground surface inclination is about 12 horizontal to 1 vertical (12:1). At the time of our investigation, few trees and very short grass covered the ground surface. An area below the proposed cave was graded to accommodate several buildings, including a house and two barns.

SUBSURFACE CONDITIONS

The subsurface data indicates that the ground surface at the site is underlain by, from top to bottom, the following:

- Natural soil to depths of about 7 feet
- Up to about 7 feet of old alluvium (only near the base of the slope)
- Up to about 7 feet of completely weathered shale
- Serpentinite extending to the maximum depth drilled of about 43 feet

The natural soil is stiff to very stiff silty clay with moderate to high plasticity. The old alluvium is very dense sandy silt to medium stiff to hard sandy clay with rounded gravel and moderate plasticity. The shale is completely weathered, crushed, soft and friable. The serpentinite is slightly to moderately weathered, and often sheared. Tests indicate that it has an intact unconfined compressive strength ranging from about 18 to 64 pounds per square inch (psi). It tends to be clayey in places with some resealed fracture and shear surfaces. Visual observation of the serpentinite samples revealed the presence of fibers within the rock. The fibers could be naturally occurring asbestos, but we did not perform the necessary laboratory testing to confirm (not in our work scope).

Condor interpreted the soil and bedrock conditions based on the field and laboratory data. The contacts between soil and rock types shown on the logs are approximate and some may be gradational, while others are sharp. Subsurface conditions are likely to vary with location.

GROUND TEMPERATURE AND GROUNDWATER MEASUREMENTS

On November 14, 2013 and June 12, 2014, Condor performed borehole monitoring to investigate the subsurface ground temperature and groundwater conditions. A thermal couple probe (together with backup thermometer) and water depth sounder were used to measure subsurface ground temperatures and water levels in one exploration borehole that was converted to a piezometer. The following data were recorded:

Depth	Nov 2013	June 2014
Surface air	57	77
10-ft	64	63
20-ft	61	62
30-ft	60	61
40-ft	60	61

November 14, 2013 – Groundwater encountered at a depth of 16.9 feet.
June 12, 2014 – Groundwater encountered at a depth of 12 feet.

CONCLUSIONS AND RECOMMENDATIONS

Based on review of the subsurface data and our engineering evaluation, Condor concludes that construction of the proposed wine cave is feasible, but that for much of the site, caves constructed using cut-and-cover methods are more suitable than tunnels.

OVERALL DISCUSSION AND CONCLUSIONS

Conventionally, wine caves are mined using mechanical excavation equipment such as road headers, and the tunnel heights are about 12 feet. Based on our evaluation, Condor concludes that these conventional

mining techniques could be executed where there is at least 4 feet of ground cover over the proposed tunnel crown. Therefore, mining may be feasible for this project, for 12-foot high tunnels, where the existing ground surface is about 16 feet higher than the proposed tunnel invert. Because the proposed invert finish-floor elevation is about 113 feet, only a very limited area would be available for mining (area beyond the el. 129 contour).

The subsurface data indicates that the tunneling ground is "poor" (classification based on Bieniawski, 1988). Therefore, standup times will be relatively short, and we anticipate that rapid placement of temporary support will be required. In addition, groundwater seepage together with clayey ground may result in "very poor" ground and tunnel invert stability problems in some areas. For the reasons described, Condor suggests that using cut-and-cover techniques and instead of tunneling may be more practical for this project. Advantages of using cut-and-cover techniques are that they would allow more flexibility for constructing wider tunnels and tunnels that are more closely spaced.

One significant issue for constructing cut-and-cover caves is maintaining adequate horizontal setback of the proposed caves from the adjacent property line to allow for temporary cutslopes with adequate stability. Temporary cutslopes up to about 22 feet high will be required to excavate the site down to elevation ±113 feet. Based on our evaluation, Condor preliminarily concludes that cutslopes up to 22 feet high may need surface inclinations as flat as 1.75 horizontal to 1 vertical (1.75:1) because the rock exposed will be relatively weak. Where there is not adequate setback for temporary cutslopes, perhaps as much as 40 feet for this project, then temporary shoring will be required to support a lower portion of the cut. The most appropriate shoring type will likely be reinforced shotcrete retaining walls with soil nails.

The rock in proposed excavations will include serpentinite, and we consider it likely that naturally occurring asbestos (NOA) will be present. Therefore, excavation and grading should be performed in accordance with the California Air Resources Board (CARB) Air Toxic Control Measure Final Regulation Order, Asbestos Airborne Toxic Control Measure for Construction, Grading, Quarrying, and Surface Mining Operations, dated July 29, 2002. The presence of serpentine requires either following Airborne Toxic Control Measures (ATCMs) during earthwork, or as an alternative performing an extensive sampling and testing program to justify applying for an exemption to CARB to allow not following ATCMs. Because of the high investigation cost that is required to apply for exemption and the likelihood that the investigation will result in the need to follow ATCMs, Condor recommends following ATCMs during earthwork. Requirements for ATCMs consist of special earthwork construction procedures to reduce airborne NOA, engineering control/air monitoring during earthwork to protect workplace safety and reporting to the CARB. Such requirements would apply to both open excavation for cut-and-cover and tunneling methods.

GROUND TEMPERATURES

Based on our evaluation of preliminary data, Condor anticipates that the natural long-term cave operating temperature will average about 62°F and will fluctuate ±5 to 8 degrees because of seasonal variations (due to relatively low ground cover) and operating activities, including lighting. Therefore, we recommend that a thermal break between the cave structure and the surrounding ground, and mechanical cooling should be considered.

GROUND CONDITIONS

Based on our review of the data and our evaluation, Condor anticipates that mass excavation will expose up to 8 feet of colluvium, old alluvium, and shale over serpentinite. The colluvium and old alluvium will consist of medium stiff to hard fat clay and lean clay, and very dense sandy silt. The shale will be highly weathered and will have the consistency of very dense silty sand with gravel. The serpentinite will likely be moderately to highly weathered, sheared and clayey in some places.

TUNNELING GROUND

Condor anticipates that any mining performed for the project will encounter ground classified as "poor" to "very poor" with relatively short stand up time. There is significant potential for encountering rock blocks bound by intersecting shear planes with fall potential. Such blocks may present a significant hazard, and they may pose the potential for caving in and daylighting the cave. There will also be ground susceptible to raveling exposed at mined tunnel crown. Rapidly installing steel ribs, rock bolting, or other temporary support measures may be required to support such blocks and unstable ground.

GROUNDWATER

Based on our review of available subsurface data and our experience, Condor concludes groundwater seepage through the natural ground and into the cave zone is likely, and that mitigation would be required to address nuisance water seepage. Water inflow will be more problematic where perched water is encountered and moderate inflows are expected in some areas. For cut-and-cover caves, the potential for groundwater seepage into the caves is reduced because the exterior of these structures would be drained.

Because of the potential for groundwater behind the tunnels, tunnel liner quality and seepage mitigation are important design and construction considerations. An effective and practical method to reduce seepage into the tunnels is by placing regularly spaced prefabricated drain strips between the ground and tunnel liner and a 4-inch diameter perforated subdrain (or larger subdrain) beneath the tunnel floor slabs, coupled with a water seepage mitigation membrane in the shotcrete liner. For cut-and-cover caves, subdrains could be placed at ground exposed at open cutslopes, and the structures would be waterproofed on the outside prior to burial.

Concrete mixes and placement requirements should be also designed to reduce groundwater transmission.

Cut-and cover cave floors can be essentially flat, with local drainage and sloped subsurface drain pipes. Tunnel floors should slope at 1.5 to 2 percent toward the portals for gravity drainage of the collected seepage water.

Condor should re-evaluate requirements for seepage mitigation after we observe and evaluate exposed ground conditions during construction.

TUNNEL SUPPORT

Based on our review of the available subsurface data and our preliminary evaluation, Condor preliminarily concludes that mined tunnels that are 14-feet wide will require reinforced shotcrete liners that are at least 8-inches thick. Wider cut-and cover caves may require 10- to 12-inch or thicker concrete arches. Condor should re-evaluate the tunnel liner requirements during the final design stage.

CONSTRUCTION CONSIDERATIONS

Condor anticipates that advanced rates for tunnels mining using mechanical excavation will be relatively low because of the weak and sheared ground, relatively short stand up time, and the associated need for relatively short excavation rounds, shoring, and rapid placement of initial support. Based on our experience, we anticipate advance rates of 2 to 4 feet per heading per day (for a typical 14-foot wide by 12-foot high tunnel excavation heading), depending on the Contractor's means and methods, and ground conditions. The Contractor should place initial support based on their experience and observations of the actual ground conditions.

Where there is low ground cover and soil is exposed in the tunnel crown, the Contractor should be prepared to excavate in shorter rounds and to place initial shotcrete soon after exposing the ground to reduce the risk of caving and daylighting.

Condor anticipates that the serpentinite exposed along tunnel inverts and soil subgrades will soften from groundwater seepage and equipment traffic during construction, and that it will deflect and rut under equipment. For mined tunnels, at least footings and likely curved reinforced concrete subinverts will be required. Overexcavation and placement of lean concrete mud slabs may also be appropriate to stabilize subgrades of mined tunnels to facilitate construction. For soil subgrades beneath cut-and-cover tunnels, overexcavation and placement of aggregate with or without a geotextile beneath it may be appropriate.

Relatively light compaction equipment will be required for compaction of backfill beside and above cut-and-cover caves to reduce stresses imposed on the structures.

Because the ground exposed in open cuts will be relatively weak, relatively low excavation lifts may be required for constructing shotcrete retaining walls to maintain adequate temporary stability. In addition, rapid placement of initial shotcrete may be required.

Condor should re-evaluate the stability of excavations for open cuts and mined tunnels during construction. The Contractor is responsible for tunnel support for construction safety and maintaining the stability of temporary cutslopes. Condor should determine the requirements for final liners of mined tunnels by observing and evaluating conditions of exposed ground and site conditions, excavation methods, and by consulting with the Contractor (the Owner's representative). We anticipate that monitoring of ground movements of mined tunnels will be required for our evaluation.

ADDITIONAL SERVICES

Because subsurface conditions will vary and the level of this study was limited in scope and detail, it is impossible to include all geotechnical design and construction considerations. In addition, recommendations used as a basis of construction details are sensitive to a need for additional field information or adjustment in the field during construction. The adjustments are also dependent upon findings during construction that could previously only be assumed based on the limited information. Because the intent of the recommendations within this report are best understood by Condor representatives, we recommend that future phases of cave geostructural work, including field engineering, inspection, and testing during shotcrete retaining wall/tunnel construction, be performed or directed by Condor. If Condor is not retained for future phases of work, the responsible professionals should thoroughly review this report and concur with its conclusions and recommendations or provide alternative recommendations.

LIMITATIONS

The conclusions and recommendations contained in this preliminary evaluation report are for planning and preliminary design of the proposed Ramey Wine Cave project. Additional services and recommendations will be required for final design and construction. The conclusions and recommendations contained in this report are invalid if the assumed project or site conditions change, if this report is used for adjacent or other property, or if the recommendations contained in ADDITIONAL SERVICES are not followed.

This report provides an initial evaluation of the anticipated site and tunneling conditions. The evaluation included field observations and literature review prior to the start of site subsurface exploration. Information contained in this report is intended to describe anticipated subsurface conditions that may be encountered and recommend appropriate actions to address those conditions. Geologic data obtained by Condor to date are not necessarily representative for all areas of the proposed caves because subsurface conditions vary.

Because actual conditions encountered vary, recommendations provided herein should be verified during construction.

A detailed review of site permit requirements or other regulatory constraints is beyond the scope of this report. In addition, information contained in this report shall not relieve the Contractor(s) of their responsibility for jobsite safety practices.
This report was prepared in accordance with the generally accepted standards of geologic and engineering practice that exist in Sonoma County at the time the report was written. No other warranty, express or implied, is made.

Changes in the standards of practice in the field of engineering, geology and geotechnical engineering changes in site conditions such as new excavations or fills, new agency regulations, or modifications to the proposed project warrant professional review of this report. Because of these factors, there is a practical limit to the usefulness of this report without critical professional review. It is suggested that 2 years be considered a reasonable time for the validity of this report update.

1. Compiled and modified from Armstrong, 1978; McLaughlin, undated field sheet; Blake and others, 2002; and Delattre, field mapping and revised Quaternary geology, this study.
2. Quaternary geology from Delattre, this study; partially modified from Witter and others, 2006.
3. Compiled and modified from Blake and others, 2002; Gealey, 1951; and Delattre, field mapping and revised Quaternary geology, this study.
4. Compiled and modified from Blake and others, 2002; geotechnical/fault investigation reports prepared for development within the city of Healdsburg; and Delattre, field mapping, this study.

LIST OF MAP UNITS:

Landslide Area

☐ af - Artificial fill (historical)

☐ Qhty - Stream terrace deposits (modern to latest Holocene)

☐ Qht - Stream terrace deposits (Holocene)

☐ Qoa - Older alluvial deposits, undivided (early to late Pleistocene)

☐ Qls - Landslide deposits (historical to Pleistocene)

☐ KJfm - Franciscan Central Belt mélange (Late Cretaceous to Early Jurassic)

☐ KJgvs - Mudstone, shale, and sandstone (Early Cretaceous and Late Jurassic)

APPENDIX A
Boring and Test Pit Logs

UNIFIED SOIL CLASSIFICATION SYSTEM

Division		Group Symbol	Group Name
Coarse-Grained Soils (more than 50 percent retained or the No. 200 sieve)	**Gravel** (% gravel > % sand)	**GW**	Well-graded Gravel (with Sand)
		GW-GM	Well-graded Gravel with Silt (and Sand)
		GW-GC	Well-graded Gravel with Clay (and Sand)
		GP	Poorly graded Gravel (with Sand)
		GP-GM	Poorly graded Gravel with Silt (and Sand)
		GP-GC	Poorly graded Gravel with Clay (and Sand)
		GM	Silty Gravel (with Sand)
		GC	Clayey Gravel (with Sand)
	Sand (% sand ≥ % gravel)	**SW**	Well-graded Sand (with Gravel)
		SW-SM	Well-graded Sand with Silt (and Gravel)
		SW-SC	Well-graded Sand with Clay (and Gravel)
		SP	Poorly graded Sand (with Gravel)
		SP-SM	Poorly graded Sand with Silt (and Gravel)
		SP-SC	Poorly graded Sand with Clay (and Gravel)
		SM	Silty Sand (with Gravel)
		SC	Clayey Sand (with Gravel)
Fine-Grained Soils (50 percent or more passing the No. 200 sieve)	**Silt or Clay** LL < 50	**ML**	Silt (with Sand or Gravel), Sandy Silt (with Gravel), Gravelly Silt (with Sand)
		CL-ML	Silty Clay (with Sand or Gravel), Sandy Silty Clay (with Gravel), Gravelly Silty Clay (with Sand)
		CL	Lean Clay (with Sand or Gravel), Sandy lean Clay (with Gravel), Gravelly lean Clay (with Sand)
		OL	Organic Clay (with Sand or Gravel), Sandy organic Clay (with Gravel), Gravelly organic Clay (with Sand), organic Silt (with Sand or Gravel), Sandy organic Silt (with Gravel), Gravelly organic Silt (with Sand)
	Silt or Clay LL ≥ 50	**MH**	Elastic Silt (with Sand or Gravel), Sandy elastic Silt (with Gravel), Gravelly elastic Silt (with Sand)
		CH	Fat Clay (with Sand or Gravel), Sandy fat Clay (with Gravel), Gravelly fat Clay (with Sand)
		OH	Organic Clay (with Sand or Gravel), Sandy organic Clay (with Gravel), Gravelly organic Clay (with Sand), organic Silt (with Sand or Gravel), Sandy organic Silt (with Gravel), Gravelly organic Silt (with Sand)
Highly Organic Soils		**PT**	Peat and other highly organic soils

Note: Percentages are by dry weight. Soil classifications based on some criteria that are not shown. Group Name items in parentheses may or may not apply, depending on percent of sand or gravel.

Coarse Grained Soil Definitions	
Fraction	**Particle Dimension or U.S. Standard Sieve Size/No.**
Boulders	Above 12"
Cobbles	12" to 3"
Gravel - coarse - fine	 3" to 3/4" 3/4" to No. 4
Sand - coarse - medium - fine	 No. 4 to No. 10 No. 10 to No. 40 No. 40 to No. 200

■	Split-barrel, 3-inch O.D., 2.43-inch I.D.
▨	Split-barrel, 2.5-inch O.D., 1.93-inch I.D.
◩	Standard Penetration Test (SPT), 2.0-inch O.D., 1.375-inch I.D.
◧	Shelby Tube
☒	Disturbed sample
●	No recovery
▽	Groundwater level during drilling
▬	Subsequent groundwater level

Note: O.D. = outside diameter I.D. = inside diameter

CONDOR

CONDOR EARTH TECHNOLOGIES, INC.

LOG LEGEND AND
SOIL CLASSIFICATION

WEATHERING

Severely Weathered – minerals decomposed to soil, but rock fabric and structure are preserved.
Highly Weathered – abundant fractures coated with oxides, carbonates, sulphates, mud, etc., thorough discoloration, rock disintegration, mineral decomposition.
Moderately Weathered – some fracture coating, moderate or localized discoloration, little to no effect on cementation, slight mineral decomposition.
Slightly Weathered – a few stained fractures, slight discoloration, little or no effect on cementation, no mineral decomposition.
Fresh – unaffected by weathering agents; no appreciable change with depth.

FRACTURE, JOINT, OR SHEAR SPACING

(Spacing in Inches)

Very little fractured	Greater than 48
Occasionally fractured	12 to 48
Moderately fractured	6 to 12
Closely fractured	1.25 to 6
Intensely fractured	0.5 to 1.25
Crushed	Less than 0.5

THICKNESS OF SEDIMENTARY ROCK BEDS

(Thickness in Inches)

Very thickly bedded	Greater than 72
Thickly bedded	24 to 72
Medium bedded	8 to 24
Thinly bedded	2.5 to 8
Very thinly bedded	0.75 to 2.5
Laminated	0.25 to 0.75
Thinly laminated	Less than 0.25

FRACTURE OR LAYER SEPARATION

(Thickness of Separations in Millimeters)

Very tight	< 0.1 mm
Tight	0.1 – 0.5 mm
Moderately open	0.5 – 2.5 mm
Open	2.5 – 10 mm
Very wide	> 10 mm

FRACTURE OR LAYER ROUGHNESS

Very Rough - Non-continuous, Hard joint rock wall
Slightly Rough - Hard joint rock wall
Slightly Rough and Soft - Soft joint rock wall
Slickensided - Open and continuous with gouge
Soft Gouge - Open and continuous with soft gouge

STRUCTURE

Intact/Massive – intact rock specimens with few widely spaced discontinuities.
Blocky – well interlocked, undisturbed rock mass, consisting of cubical blocks formed by three intersecting joint sets.
Very blocky – interlocked, partially disturbed, with multi-faceted angular blocks formed by 4 or more joint sets.
Disturbed/Seamy – folded with angular blocks, formed by many intersecting joint sets, persistence of bedding planes or schistosity.
Disintegrated – poorly interlocked, heavily broken, mix of angular and rounded rock pieces.
Laminated/Sheared – lack of blockiness due to close spacing of shear planes.

STRENGTH

Plastic or very low strength.
Friable – crumbles easily by rubbing with fingers.
Weak – an unfractured specimen of such material will crumble under light hammer blows.
Moderately strong – specimen will withstand a few heavy hammer blows before breaking.
Strong – specimen will withstand a few heavy ringing hammer blows and will yield with difficulty only dust and small flying fragments.
Very strong – specimen will resist heavy ringing hammer blows and will yield with difficulty only dust and small flying fragments.

HARDNESS

Soft – reserved for plastic material alone.
Low hardness – can be gouged deeply or carved easily with a knife blade.
Moderately hard – can be readily scratched by a knife blade; scratch leaves a heavy trace of dust and is readily visibly after the powder has been blown away.
Hard – can be scratched with difficulty; scratch produced a little powder and is often faintly visible.
Very hard – cannot be scratched with knife blade; leaves a metallic streak.

DESCRIPTION

COLLUVIUM - Silty Lean Clay (CL) - brown, dry, stiff, moderate plasticity

FRANCISCAN COMPLEX - MALANGE - SHALE
Light brown, dry, Highly weathered (some less weathered pieces) Friable, highly Sheared or Crushed to a silty sand with low-mod plasticity, w = 13.3 γ_d = 91
Dark brown, wet, highly weathered, crushed to coarse sand

SERPENTINITE
Greenish grey, wet, Extremely soft, Friable, sheared
Brown-Tan, extremely weathered, crumbles to sand
Light green, highly weathered, soft, clayey, friable, some larger clasts.
Highly sheared, weak, moderately hard, mod-high weathering
Soft - moderately hard, sheared, some shear planes, mostly platy nature of the rock, weak, Clayey in places, some places hard enough to maintain moderate fracture
15.5' - γ_d = 148.5pcf, w = 2.9% q_u = 43 psi Young's modulus = 2.035 E+03
16' - LL = 62, PI = 23 w = 29.7 γ_d = 94 c = 90 ϕ = 18.8
Soft, weak, moderately weathered, sheared to soft clay in places
Some apparent fractures, soft and hard portions interbedded, some clasts.
Dark grey with streaks and seams of light green to white, lighter colored portions are very soft
23.5' - γ_d = 126.9pcf w = 10.6% q_u = 18psi
Young's modulus = 9.318E+02
Dark grey/green, Moderately hard, weak, sheared,
Black with some green Inclusions, Soft, Weak to friable, sheared, clayey, moderate weathering, some washout (27.5'-30'), (could be some shale inclusions)
Occasionally firm but mostly soft
Clayey, increase of weathering

Boring Terminated at 33'

Subject: Williams Selyem Well Impact Assessment – Letter Opinion
Ramey Wine Cellars

Dear Mr. Ramey:

This letter report is provided in accordance with your direction to evaluate the potential impacts to a neighbor's well as a result of potential groundwater drainage resulting from your proposed wine cave installation. In developing this opinion, Condor Earth Technologies, Inc. (Condor) reviewed existing reports and documentation, and had discussions and correspondence with Edwin Lin, consultant for John Dyson of Williams Selyem (WS) vineyards.

Setting

The proposed cut and cover cave will drain groundwater, lowering the groundwater surface at the back of the cave. WS operates a supply well for domestic use located approximately 200 feet west of the back of the proposed cave and 25 feet higher in elevation. WS wishes to know if the Ramey construction could impact their existing well production. They have hired Edwin Lin, a hydrogeologist, from Todd Groundwater (TG) who has provided Condor information about the WS well.

Hydrogeologic Information

In November 2013, Condor drilled exploratory boring B-3 at a surface elevation of approximately 135 feet msl[1] to a total depth of 43 feet bgs[2]. B-3 was completed as a piezometer and depth-to-groundwater was measured in November 2013 (16.9 feet bgs) and in June 2014 (12 feet bgs). A cave plan showing the location of B-3 and the geologic log are attached (Attachment 1). Geologic material is Franciscan Melange including serpentinite and mudstones of unknown porosity and hydraulic conductivity. These are malleable rock types that readily degrade to clay material and do not transmit groundwater well. The cave floor invert elevation is approximately 108 feet msl. Measured saturated thickness that will be drained at the back of the cave excavation is approximately 15 feet.

WS drilled an observation well about 75 feet south of B-3 and at about the same elevation. The observation well is 80 feet deep with a screen from 30 to 80 feet bgs. The geologic material encountered was thought to be volcanic rock, but this is uncertain due to the air rotary drilling method that produced gray pulverized dust. The drilling did not encounter a groundwater producing zone but the well later filled to within 10 feet of the surface with groundwater from seepage. Mr. Lin provided a plan and cross section

---

[1] Mean sea level

[2] Below ground surface

showing the well relationships, a well log of the WS supply well, and information on recent pumping (Attachment 2). From this data it is possible to make some hydrogeologic inferences.

First, the WS well log shows it was drilled to 140 feet bgs with a surface seal to 50 feet and a 60-foot screen. The top screen openings are at approximately the same elevation as the top screen in Ramey's B-3. The WS borehole log indicates "Fractured" and "Hard" volcanic rock to 80 feet and "Green serpentine" from 80 to 140 feet. The screen location, set between 53 and 113 feet, suggests the driller was interested in the volcanic rock and avoided the serpentinite at the bottom of the boring. Fractured hard rock has better groundwater transmissivity than serpentinite.

Mr. Lin reported that WS maintenance personnel pumped their well on 4/2/15 for 61 minutes to produce 4,000 gallons (65.6 gpm). The well drew down from a static water level of 32 feet bgs to 52 feet in 4 minutes (emptied the well casing) then gradually drew down to 55 feet after 61 minutes. This preliminary data gives us some idea of the transmissivity of the aquifer. The well appears to produce ample water for their domestic use.

Discussion

Serpentinite occurs near the surface at B-3 and is found approximately 50 feet lower in elevation at the WS well 200 feet to the west. The data suggest a sloping geologic contact or offset between the volcanics (above) and the serpentinite (below). The same offset contact may exist between the B-3 and the WS observation well to the south.

Groundwater encountered at the Ramey cave site will be entirely in serpentinite that is weathered to clay, soft and sheared. This material does not transmit groundwater readily. In contrast, the groundwater entering the WS well is derived from fractured hard rock, which transmits groundwater relatively well. The bulk of water pumped from the WS well will preferentially come from the volcanics. If a hydraulic connection exists between the WS well and the Ramey cave excavation we expect it to be very small to negligible.

A hypothetical procedure can be used to provide an order of magnitude estimate of a worst case impact from the cave excavation if a direct hydraulic connection does exists. Assuming the flow rates, timing and drawdown reported by WS personnel are reasonably accurate; Condor can estimate the transmissivity of the volcanic aquifer. Conservatively assuming the same transmissivity in the serpentinite, the impact on the well's maximum sustained production would be 3 percent or less. The WS supply well only needs to fill their 4,000 gallon tank, which they do in 61 minutes. In this hypothetical (and unlikely) scenario, the maximum possible inconvenience from lowering the groundwater at the cave site would be pumping for an additional 2 minutes each time the tank is filled.

To better characterize the WS well capacity, Mr. Lin is planning a pumping test on April 14, 2015. His test will attempt to better estimate the aquifer parameters by documenting the pumping rates and measuring response in the deep observation well near the cave site. They request access to Ramey's B-3, which we recommend be granted. This pumping test provides Ramey an excellent and conclusive method to identify if the shallow groundwater at B-3 is hydraulically connected to the WS production well. Mr. Lin's plans are to pump the well at progressively higher rates and measure hydraulic head in the observation wells, including B-3. In our experience, observation wells 200 feet from a pumping well will have small to negligible responses that will be hard to identify by hand measurements.

Conclusions and Recommendations

In Condor's opinion there is little chance that an impact from cave drainage to WS well pumping can be demonstrated.

The pumping test planned for April 14, 2015 provides Ramey a convenient way to determine the hydraulic connection between the shallow groundwater at the cave site and the WS well; however, the methods planned by TG are unlikely to be conclusive because of the spotty nature of manual readings. Condor recommends Ramey provide TG access to B-3 on April 13 and 14, 2015 for their test.

If Ramey desires to put this issue to rest, we recommend installing sensors in both the WS observation well and B-3 throughout the test to measure head pressures in the wells continuously. In this manner small or short lived responses to the pumping, or their absence can be identified, correlated and documented.

Condor participation on the TG field program would cost approximately an additional $5,500 over our current authorization. A work scope and cost estimate for this support is attached. Alternatively, Ramey could rely on WS's consultants to come to a conclusion. Condor would support Ramey by reviewing the data, procedures and conclusions from TG's testing.

However, if TG performs their study independently and Condor disagrees with their conclusions, then we would likely need to perform additional pumping tests (at an additional estimated cost of perhaps $15,000 to $20,000).

Please contact us with questions, concerns, and whether or not you would like us to proceed with the TG participation.

Respectfully submitted,

CONDOR EARTH TECHNOLOGIES, INC.

NOTE ON GROUNDWATER AND CIRCULATION: Moderate to Poor Circulation

DESCRIPTION

COLLUVIUM - SANDY LEAN CLAY (CL) - with some gravel. Brown, dry, moderate plasticity, very stiff

Red-Brown, damp, more silty, very stiff, moderate plasticity.

Coarse sand in red-brown clay matrix (crushed shale/mudstone)

5'; w = 12.6 γd = 87 Su = 7,070

FRANCISCAN COMPLEX - MALANGE - SERPENTINITE

Light green, weak to Friable, low hardness, Highly weathered, blocky - seamy

Orange-brown, extremely weathered, crushed

Grey-green, crushed to seamy and sheared Highly weathered, low hardness, parting, some re-sealed fracture, but mostly too soft for fracture.

Mudstone clasts ~ 2.5", rounded to sub-angular weak to friable, low hardness

3.4" mudstone gravel, moderately hard, low strength, blocky to seamy with some re-sealed fractures.

21.5: LL = NV PI = NP F = 17.0

24.5: LL = 74 PI = 35 F = 14.8, γd = 70, One dimensional Expansion test

Dark green, low hardness to soft, rare fracture, blocky texture (mudstone cobbles in clayey serpentinite)

Dark green to black, soft, weak, crushed to sheared

30.5'; w = 13.4 γd = 114 Su = 2,150

Soft to moderate hardness, weak, sheared, re-sealed shear surfaces, no true fracture

Dark grey - black, very soft, very weak to friable sheared to clay (could be some shale inclusions)

33' - γd = 133.7 pcf qu = 64 psi youngs modulus = 2.172E+02 w = 9.8%

Moderately hard, moderately strong, some shear, mostly very blocky to massive, mod - high weathering,

Dark green, soft to moderately hard, weak, seamy to very blocky in places, clayey

Boring Terminated at 43 feet

FRACTURE LOG: crushed

Subject: Re: Ramey wine caves project

John/Scott,

It was a pleasure talking with you yesterday and thank you again for offering the transducers. I spoke with the folks at Williams Selyem (WS), and conducting the pumping test on Tuesday April 14 will work best for them. Please let me know if that fits your staff's schedule. Just wondering, would it be helpful (ie save time on the day of the test) to install the transducers in the two monitoring wells the day before)?

We will be able to measure water levels in the production well with a manual sounder (to 0.1 ft accuracy), and measure discharge with a flowmeter. That said, I will check with the maintenance guy I see if it is possible to get a transducer down the access port. I received some preliminary well test information from the WS head of maintenance. Yesterday they pumped the well yesterday for 61 minutes (the time it took to fill 4,000 gallons of their storage tank). That equates to 65.6 gpm. Static water level was at 32 feet at the start of the test, dropped to 52 feet after 4 min, and gradually drew down to 55 feet after 61 min. The specific capacity is thus quite a bit higher than what was reported in the short test reported in the DWR well completion report.

I am out of the office today but will update my cross section with more accurate well locations and well completion data as soon as I can and will forward to you and Scott.

Be in touch,
Ed

Condor Project No. 6692

November 2, 2018

David Ramey
Ramey Vineyards, LLC.
PO Box 788
Healdsburg, CA 95448

Subject: **Wine Cave Design and Construction**
Licensing Requirements
Ramey Wine Cellars
7097 Westside Road
Healdsburg, California

Dear Mr. Ramey:

As requested, Condor Earth (Condor) herein provides clarification of current design and construction licensing requirements for the subject proposed Wine Cave.

The proposed cave will be constructed using cut-and-cover methods, which means that a temporary surface excavation will be made, a structure will be constructed, and the structure will be buried. The result will be a subterranean structure. There will be no significant difference, design and construction licensing wise, for this structure compared to a typical surface structure. Engineering components of the cave structure (civil grading, geotechnical, structural, mechanical, electrical, etc.) will be designed by California-licensed engineers, and the construction components will be built by California-licensed contractors. Licensing requirements for tunneling will not apply to this project.

Please contact Condor if you have any questions or if you require additional information.

Respectfully submitted,

CONDOR EARTH

Subject: Wine Cave Data and Feasibility Report
Ramey Wine Cellars
7097 Westside Road
Healdsburg, California

Dear Mr. Ramey:

As per your request, Condor Earth (Condor) reviewed our January 17, 2014 Tunnel Data and Feasibility Report, and updated project plans prepared by Lundberg Design, dated September 9, 2018. Condor has provided this feasibility update based on the current plans and project needs.

This report presents the results of an evaluation performed by Condor to provide subsurface data, and preliminary geotechnical engineering conclusions and recommendations for the design and construction of wine caves at Ramey Wine Cellars. Figure 1, Vicinity Map, shows the approximate site location.

SITE AND PROJECT DESCRIPTION

Figure 2, Site Plan, shows the proposed wine cave area and portals diagramically; refer to the current project plans for the proposed new wine cave layout. The proposed cave project will consist of constructing a 20,720 sf wine cave with three portals using entirely cut-and-cover methods. Note that our 2014 report included considerations for portions of the cave possibly being constructed using tunneling methods. The new cave will be designated as a Type 2 Winery Cave, per Section 446 of the California Building Code.

The portals will be located along a new winery building wall approximately 260 feet in length. The proposed caves will be 36 feet wide and 16 feet high. The rough cave area dimensions are 230 feet by 113 feet; the maximum travel distance from the back of the cave to the exterior of the adjacent building is approximately 235 feet. At the currently proposed portals, there is approximately a 9-foot elevation difference between the proposed finished floor (elevation ±113 feet) and the existing ground surface; at the back of the caves there is approximately a 20-foot elevation difference between the proposed finished floor and the existing ground surface. Soil material from the cave area cuts will be used as fill over the top of the cut-and-cover caves.

The cave area excavation will require cuts up to about 22 feet deep, which will be temporarily shored during construction. The cave structures will include cast-in-place foundations, stem walls and concrete slabs, and pre-cast tunnel arch segments.

If the project plans change and the geotechnical aspects of the project vary significantly from those described, then Condor should be notified and reevaluate our conclusions and recommendations in this report.

SCOPE OF WORK

Condor's scope of work was presented in our September 3, 2013 Proposal (Task 1 and 2) and consisted of the following:

- Investigated ground conditions by drilling four vertical borings to depths that extend to more than 10 feet below the level of the proposed tunnel floor at adjacent tunnel locations, and by excavating five test pits near the proposed shotcrete retaining wall.
- Installed a piezometer in boring B-3 to permit subsequent measurement of groundwater levels and monitoring of ground temperature (see Figure 2).
- Tested selected samples of soil and rock to measure relevant index and engineering properties.
- Prepared this report that presents the following:
  - Vicinity Map
  - Site Plan showing existing site topography, the proposed cave, approximate boring locations and approximate test pit locations
  - Boring and Test Pit Logs
  - Photographs of retrieved core
  - Laboratory test reports
  - Description of site geology and seismicity
  - Discussion of general surface and subsurface conditions, including groundwater
  - Preliminary conclusions regarding anticipated subsurface conditions to be exposed in proposed excavations for the wine cave and portals (and variability of such conditions), including rock structure, weathering, rock fracture, characteristics, rock unconfined compressive strength, rock hardness, and RQD.
  - Conclusions regarding geotechnical issues for design and construction, including the following:
    - Anticipated ground temperatures and cave operating temperatures (at various portions of the cave)
    - General tunnel ground characteristics (and variability depending on ground over and variation of rock characteristics)
    - Excavatability of rock
    - Potential for groundwater seepage and options for water seepage mitigation
    - Tunnel stability and unsupported stand-up time
    - Anticipated tunnel advance rates and requirements for temporary support
    - Estimated tunnel liner requirements

SITE AND SUBSURFACE INVESTIGATION METHODS

Condor investigated subsurface conditions at the site on November 4 and 5, 2013 by drilling four borings (B-1, B-2, B-3 and B-4) to depths of about 20, 33, 43 and 20 feet respectively. A track-mounted CME-55 drill rig and both auger and core drilling techniques were used.

A Condor staff geologist visually logged the earth materials encountered during drilling and directed the sampling of soil and rock. Five test pits were excavated on November 5, 2013 to depths of about 3 to 7 feet. Figure 2 shows the approximate boring and test pit locations. Boring and test pit logs with the descriptions

and classifications of rock properties are attached in Appendix A. Appendix B contains photographs of the core.

Soil samples were recovered with PQ core or with 3-inch outside diameter split-spoon samplers driven 18 inches (or to practical refusal) over three 6-inch increments. The split-spoon samplers were driven into the ground using a 140-pound hammer dropped 30 inches by an automatically tripped hammer system. The boring logs show, at the appropriate depths, the field blow counts for each 6-inch drive. When refusal occurred, the logs show the blows required to drive the sampler over the final increment, and the number of inches driven over this final increment. Condor visually classified soils using the Unified Soil Classification System and characterized the engineering properties of the rock. Condor delivered soil and rock samples to our laboratories (including subcontracted laboratories) for further examination and testing. We performed unconfined compressive strength, plasticity index and triaxial shear tests. Appendix C contains the laboratory test reports.

After drilling, B-1, B-2 and B-4 were backfilled with lean cement grout, and a piezometer (groundwater level monitoring well) was installed in B-3. Test pits were filled in with excavated material and tamped down with backhoe bucket.

SITE GEOLOGY

Available geologic maps indicate that rock in the project vicinity belongs to the Franciscan Complex Mélange dating approximately late Cretaceous to Early Jurassic. This unit includes dominantly metamorphosed rocks, including greywacke, shale and serpentinite. The project site is mapped within the Franciscan Central Belt mélange, designated "KJfm" on Figure 3, Geologic Map. The subsurface data indicates that the Franciscan Mélange at the site is serpentinite. Although Figure 4, Ultramafic Map, does not indicate that there is ultramafic rock at this project site, it was encountered during drilling.

The Subsurface Conditions section of this report presents additional information.

SITE SEISMICITY

This site is located in a seismically active area of California in an area of regional faulting. Figure 5, Regional Fault Map, shows that the nearest active fault (Rodgers Creek Fault) is about 5.5 miles from the project site. The site is also about 3.5 miles away from a potentially active fault, special study zone according to the Healdsburg Quadrangle map from the website of Department of Conservation, California (http://www.quake.ca.gov/ gmaps/WH/regulatorymaps.htm). Because the site is not located near any active faults, Condor concludes that the risk of surface rupture from faulting is considered low.

SITE CONDITIONS

The pertinent aspects of the site conditions are shown on Figure 2. The proposed caves occupy a hillside sloping to the northeast from an existing vineyard down to a pond and buildings. The ground surface inclination is about 12 horizontal to 1 vertical (12:1). At the time of our investigation, few trees and very short grass covered the ground surface. An area below the proposed cave was graded to accommodate several buildings, including a house and two barns.

SUBSURFACE CONDITIONS

The subsurface data indicates that the ground surface at the site is underlain by, from top to bottom, the following:

- Natural soil to depths of about 7 feet
- Up to about 7 feet of old alluvium (only near the base of the slope)
- Up to about 7 feet of completely weathered shale
- Serpentinite extending to the maximum depth drilled of about 43 feet

The natural soil is stiff to very stiff silty clay with moderate to high plasticity. The old alluvium is very dense sandy silt to medium stiff to hard sandy clay with rounded gravel and moderate plasticity. The shale is completely weathered, crushed, soft and friable. The serpentinite is slightly to moderately weathered, and often sheared. Tests indicate that it has an intact unconfined compressive strength ranging from about 18 to 64 pounds per square inch (psi). It tends to be clayey in places with some resealed fracture and shear surfaces. Visual observation of the serpentinite samples revealed the presence of fibers within the rock. The fibers could be naturally occurring asbestos, but we did not perform the necessary laboratory testing to confirm (not in our work scope).

Condor interpreted the soil and bedrock conditions based on the field and laboratory data. The contacts between soil and rock types shown on the logs are approximate and some may be gradational, while others are sharp. Subsurface conditions are likely to vary with location.

GROUND TEMPERATURE AND GROUNDWATER MEASUREMENTS

On November 14, 2013 and June 12, 2014, Condor performed borehole monitoring to investigate the subsurface ground temperature and groundwater conditions. A thermal couple probe (together with backup thermometer) and water depth sounder were used to measure subsurface ground temperatures and water levels in one exploration borehole that was converted to a piezometer. The following data were recorded:

Depth	Nov 2013	June 2014
Surface air	57	77
10-ft	64	63
20-ft	61	62
30-ft	60	61
40-ft	60	61

November 14, 2013 – Groundwater encountered at a depth of 16.9 feet.
June 12, 2014 – Groundwater encountered at a depth of 12 feet.

CONCLUSIONS AND RECOMMENDATIONS

Based on review of the subsurface data and our engineering evaluation, Condor concludes that construction of the proposed wine cave is feasible, but that for much of the site, caves constructed using cut-and-cover methods are more suitable than tunnels.

OVERALL DISCUSSION AND CONCLUSIONS

Conventionally, wine caves are mined using mechanical excavation equipment such as road headers, and the tunnel heights are about 12 feet. Based on our evaluation, Condor concludes that these conventional

mining techniques could be executed where there is at least 4 feet of ground cover over the proposed tunnel crown. Therefore, mining may be feasible for this project, for 12-foot high tunnels, where the existing ground surface is about 16 feet higher than the proposed tunnel invert. Because the proposed invert finish-floor elevation is about 113 feet, only a very limited area would be available for mining (area beyond the el. 129 contour).

The subsurface data indicates that the tunneling ground is "poor" (classification based on Bieniawski, 1988). Therefore, standup times will be relatively short, and we anticipate that rapid placement of temporary support will be required. In addition, groundwater seepage together with clayey ground may result in "very poor" ground and tunnel invert stability problems in some areas. For the reasons described, Condor suggests that using cut-and-cover techniques and instead of tunneling may be more practical for this project. Advantages of using cut-and-cover techniques are that they would allow more flexibility for constructing wider tunnels and tunnels that are more closely spaced.

One significant issue for constructing cut-and-cover caves is maintaining adequate horizontal setback of the proposed caves from the adjacent property line to allow for temporary cutslopes with adequate stability. Temporary cutslopes up to about 22 feet high will be required to excavate the site down to elevation ±113 feet. Based on our evaluation, Condor preliminarily concludes that cutslopes up to 22 feet high may need surface inclinations as flat as 1.75 horizontal to 1 vertical (1.75:1) because the rock exposed will be relatively weak. Where there is not adequate setback for temporary cutslopes, perhaps as much as 40 feet for this project, then temporary shoring will be required to support a lower portion of the cut. The most appropriate shoring type will likely be reinforced shotcrete retaining walls with soil nails.

The rock in proposed excavations will include serpentinite, and we consider it likely that naturally occurring asbestos (NOA) will be present. Therefore, excavation and grading should be performed in accordance with the California Air Resources Board (CARB) Air Toxic Control Measure Final Regulation Order, Asbestos Airborne Toxic Control Measure for Construction, Grading, Quarrying, and Surface Mining Operations, dated July 29, 2002. The presence of serpentine requires either following Airborne Toxic Control Measures (ATCMs) during earthwork, or as an alternative performing an extensive sampling and testing program to justify applying for an exemption to CARB to allow not following ATCMs. Because of the high investigation cost that is required to apply for exemption and the likelihood that the investigation will result in the need to follow ATCMs, Condor recommends following ATCMs during earthwork. Requirements for ATCMs consist of special earthwork construction procedures to reduce airborne NOA, engineering control/air monitoring during earthwork to protect workplace safety and reporting to the CARB. Such requirements would apply to both open excavation for cut-and-cover and tunneling methods.

GROUND TEMPERATURES

Based on our evaluation of preliminary data, Condor anticipates that the natural long-term cave operating temperature will average about 62°F and will fluctuate ±5 to 8 degrees because of seasonal variations (due to relatively low ground cover) and operating activities, including lighting. Therefore, we recommend that a thermal break between the cave structure and the surrounding ground, and mechanical cooling should be considered.

GROUND CONDITIONS

Based on our review of the data and our evaluation, Condor anticipates that mass excavation will expose up to 8 feet of colluvium, old alluvium, and shale over serpentinite. The colluvium and old alluvium will consist of medium stiff to hard fat clay and lean clay, and very dense sandy silt. The shale will be highly weathered and will have the consistency of very dense silty sand with gravel. The serpentinite will likely be moderately to highly weathered, sheared and clayey in some places.

TUNNELING GROUND

Condor anticipates that any mining performed for the project will encounter ground classified as "poor" to "very poor" with relatively short stand up time. There is significant potential for encountering rock blocks bound by intersecting shear planes with fall potential. Such blocks may present a significant hazard, and they may pose the potential for caving in and daylighting the cave. There will also be ground susceptible to raveling exposed at mined tunnel crown. Rapidly installing steel ribs, rock bolting, or other temporary support measures may be required to support such blocks and unstable ground.

GROUNDWATER

Based on our review of available subsurface data and our experience, Condor concludes groundwater seepage through the natural ground and into the cave zone is likely, and that mitigation would be required to address nuisance water seepage. Water inflow will be more problematic where perched water is encountered and moderate inflows are expected in some areas. For cut-and-cover caves, the potential for groundwater seepage into the caves is reduced because the exterior of these structures would be drained.

Because of the potential for groundwater behind the tunnels, tunnel liner quality and seepage mitigation are important design and construction considerations. An effective and practical method to reduce seepage into the tunnels is by placing regularly spaced prefabricated drain strips between the ground and tunnel liner and a 4-inch diameter perforated subdrain (or larger subdrain) beneath the tunnel floor slabs, coupled with a water seepage mitigation membrane in the shotcrete liner. For cut-and-cover caves, subdrains could be placed at ground exposed at open cutslopes, and the structures would be waterproofed on the outside prior to burial.

Concrete mixes and placement requirements should be also designed to reduce groundwater transmission.

Cut-and cover cave floors can be essentially flat, with local drainage and sloped subsurface drain pipes. Tunnel floors should slope at 1.5 to 2 percent toward the portals for gravity drainage of the collected seepage water.

Condor should re-evaluate requirements for seepage mitigation after we observe and evaluate exposed ground conditions during construction.

TUNNEL SUPPORT

Based on our review of the available subsurface data and our preliminary evaluation, Condor preliminarily concludes that mined tunnels that are 14-feet wide will require reinforced shotcrete liners that are at least 8-inches thick. Wider cut-and cover caves may require 10- to 12-inch or thicker concrete arches. Condor should re-evaluate the tunnel liner requirements during the final design stage.

CONSTRUCTION CONSIDERATIONS

Condor anticipates that advanced rates for tunnels mining using mechanical excavation will be relatively low because of the weak and sheared ground, relatively short stand up time, and the associated need for relatively short excavation rounds, shoring, and rapid placement of initial support. Based on our experience, we anticipate advance rates of 2 to 4 feet per heading per day (for a typical 14-foot wide by 12-foot high tunnel excavation heading), depending on the Contractor's means and methods, and ground conditions. The Contractor should place initial support based on their experience and observations of the actual ground conditions.

Where there is low ground cover and soil is exposed in the tunnel crown, the Contractor should be prepared to excavate in shorter rounds and to place initial shotcrete soon after exposing the ground to reduce the risk of caving and daylighting.

Condor anticipates that the serpentinite exposed along tunnel inverts and soil subgrades will soften from groundwater seepage and equipment traffic during construction, and that it will deflect and rut under equipment. For mined tunnels, at least footings and likely curved reinforced concrete subinverts will be required. Overexcavation and placement of lean concrete mud slabs may also be appropriate to stabilize subgrades of mined tunnels to facilitate construction. For soil subgrades beneath cut-and-cover tunnels, overexcavation and placement of aggregate with or without a geotextile beneath it may be appropriate.

Relatively light compaction equipment will be required for compaction of backfill beside and above cut-and-cover caves to reduce stresses imposed on the structures.

Because the ground exposed in open cuts will be relatively weak, relatively low excavation lifts may be required for constructing shotcrete retaining walls to maintain adequate temporary stability. In addition, rapid placement of initial shotcrete may be required.

Condor should re-evaluate the stability of excavations for open cuts and mined tunnels during construction. The Contractor is responsible for tunnel support for construction safety and maintaining the stability of temporary cutslopes. Condor should determine the requirements for final liners of mined tunnels by observing and evaluating conditions of exposed ground and site conditions, excavation methods, and by consulting with the Contractor (the Owner's representative). We anticipate that monitoring of ground movements of mined tunnels will be required for our evaluation.

ADDITIONAL SERVICES

Because subsurface conditions will vary and the level of this study was limited in scope and detail, it is impossible to include all geotechnical design and construction considerations. In addition, recommendations used as a basis of construction details are sensitive to a need for additional field information or adjustment in the field during construction. The adjustments are also dependent upon findings during construction that could previously only be assumed based on the limited information. Because the intent of the recommendations within this report are best understood by Condor representatives, we recommend that future phases of cave geostructural work, including field engineering, inspection, and testing during shotcrete retaining wall/tunnel construction, be performed or directed by Condor. If Condor is not retained for future phases of work, the responsible professionals should thoroughly review this report and concur with its conclusions and recommendations or provide alternative recommendations.

LIMITATIONS

The conclusions and recommendations contained in this preliminary evaluation report are for planning and preliminary design of the proposed Ramey Wine Cave project. Additional services and recommendations will be required for final design and construction. The conclusions and recommendations contained in this report are invalid if the assumed project or site conditions change, if this report is used for adjacent or other property, or if the recommendations contained in ADDITIONAL SERVICES are not followed.

This report provides an initial evaluation of the anticipated site and tunneling conditions. The evaluation included field observations and literature review prior to the start of site subsurface exploration. Information contained in this report is intended to describe anticipated subsurface conditions that may be encountered and recommend appropriate actions to address those conditions. Geologic data obtained by Condor to date are not necessarily representative for all areas of the proposed caves because subsurface conditions vary.

Because actual conditions encountered vary, recommendations provided herein should be verified during construction.

A detailed review of site permit requirements or other regulatory constraints is beyond the scope of this report. In addition, information contained in this report shall not relieve the Contractor(s) of their responsibility for jobsite safety practices.
This report was prepared in accordance with the generally accepted standards of geologic and engineering practice that exist in Sonoma County at the time the report was written. No other warranty, express or implied, is made.

Changes in the standards of practice in the field of engineering, geology and geotechnical engineering changes in site conditions such as new excavations or fills, new agency regulations, or modifications to the proposed project warrant professional review of this report. Because of these factors, there is a practical limit to the usefulness of this report without critical professional review. It is suggested that 2 years be considered a reasonable time for the validity of this report update.

Respectfully submitted,

LOG LEGEND AND SOIL CLASSIFICATION

WEATHERING

Severely Weathered – minerals decomposed to soil, but rock fabric and structure are preserved.
Highly Weathered – abundant fractures coated with oxides, carbonates, sulphates, mud, etc., thorough discoloration, rock disintegration, mineral decomposition.
Moderately Weathered – some fracture coating, moderate or localized discoloration, little to no effect on cementation, slight mineral decomposition.
Slightly Weathered – a few stained fractures, slight discoloration, little or no effect on cementation, no mineral decomposition.
Fresh – unaffected by weathering agents; no appreciable change with depth.

FRACTURE, JOINT, OR SHEAR SPACING

(Spacing in Inches)

Very little fractured	Greater than 48
Occasionally fractured	12 to 48
Moderately fractured	6 to 12
Closely fractured	1.25 to 6
Intensely fractured	0.5 to 1.25
Crushed	Less than 0.5

THICKNESS OF SEDIMENTARY ROCK BEDS

(Thickness in Inches)

Very thickly bedded	Greater than 72
Thickly bedded	24 to 72
Medium bedded	8 to 24
Thinly bedded	2.5 to 8
Very thinly bedded	0.75 to 2.5
Laminated	0.25 to 0.75
Thinly laminated	Less than 0.25

FRACTURE OR LAYER SEPARATION

(Thickness of Separations in Millimeters)

Very tight	< 0.1 mm
Tight	0.1 – 0.5 mm
Moderately open	0.5 – 2.5 mm
Open	2.5 – 10 mm
Very wide	> 10 mm

FRACTURE OR LAYER ROUGHNESS

Very Rough - Non-continuous, Hard joint rock wall
Slightly Rough - Hard joint rock wall
Slightly Rough and Soft - Soft joint rock wall
Slickensided - Open and continuous with gouge
Soft Gouge - Open and continuous with soft gouge

STRUCTURE

Intact/Massive – intact rock specimens with few widely spaced discontinuities.
Blocky – well interlocked, undisturbed rock mass, consisting of cubical blocks formed by three intersecting joint sets.
Very blocky – interlocked, partially disturbed, with multi-faceted angular blocks formed by 4 or more joint sets.
Disturbed/Seamy – folded with angular blocks, formed by many intersecting joint sets, persistence of bedding planes or schistosity.
Disintegrated – poorly interlocked, heavily broken, mix of angular and rounded rock pieces.
Laminated/Sheared – lack of blockiness due to close spacing of shear planes.

STRENGTH

Plastic or very low strength.
Friable – crumbles easily by rubbing with fingers.
Weak – an unfractured specimen of such material will crumble under light hammer blows.
Moderately strong – specimen will withstand a few heavy hammer blows before breaking.
Strong – specimen will withstand a few heavy ringing hammer blows and will yield with difficulty only dust and small flying fragments.
Very strong – specimen will resist heavy ringing hammer blows and will yield with difficulty only dust and small flying fragments.

HARDNESS

Soft – reserved for plastic material alone.
Low hardness – can be gouged deeply or carved easily with a knife blade.
Moderately hard – can be readily scratched by a knife blade; scratch leaves a heavy trace of dust and is readily visibly after the powder has been blown away.
Hard – can be scratched with difficulty; scratch produced a little powder and is often faintly visible.
Very hard – cannot be scratched with knife blade; leaves a metallic streak.

DESCRIPTION

COLLUVIUM - FAT CLAY (CL) - red-brown, very, stiff, moderate to high plasticity.

OLD ALLUVIUM - SANDY SILT - tan, dry, very stiff, mod-low plasticity

SANDY CLAY with GRAVEL - Tan brown to orange, dry, stiff, contains some sub-angular and some rounded gravel

GRAVEL in CLAY MATRIX - fat clay with gravel, dark brown, mod-high plasticity, soft

3.5: LL=64, PI=44 F=39.9, hydrometer

FRANCISCAN COMPLEX - MALANGE - SERPENTINITE

Dark brown to tan, Extremely weathered, crushed to angular coarse sand, blocky, soft, weak

Grey-green to light green, soft, weak, seamy with some resealed fracture (or shear planes) clayey in some places

Soft to moderately hard, weak, seamy

very clayey

16': LL=54 PI=15 w=42.6, γd=80

Black, low to moderate hardness, weak, sheared, (likely contains some shale inclusions, sheared)

Dark green, soft, weak, sheared, some mudstone coarse gravel to cobbles. LL=NV, PI=NP, F=40.7

Boring Terminated at 20 feet

Calculating Young's Modulus by Secant Modulus Method:

1. Assume fixed percentage of maximum compressive strength: 70%
2. Solving for Axial Strain, $\Delta\varepsilon_a$ @ 70% of maximum compressive strength:

$$\Delta\varepsilon_a = \varepsilon_{a2}-\{[(\sigma_2-\Delta\sigma)*(\varepsilon_{a2}-\varepsilon_{a1})]/(\sigma_2-\sigma_1)\}$$

3. Solving for Young's Modulus using the Secant Modulus Method:

Young's Modulus $$E_s = \frac{\Delta\sigma}{\Delta\varepsilon_a}$$

Subject: Wine Cave Data and Feasibility Report
Ramey Wine Cellars
7097 Westside Road
Healdsburg, California

Dear Mr. Ramey:

As per your request, Condor Earth (Condor) reviewed our January 17, 2014 Tunnel Data and Feasibility Report, and updated project plans prepared by Lundberg Design, dated September 9, 2018. Condor has provided this feasibility update based on the current plans and project needs.

This report presents the results of an evaluation performed by Condor to provide subsurface data, and preliminary geotechnical engineering conclusions and recommendations for the design and construction of wine caves at Ramey Wine Cellars. Figure 1, Vicinity Map, shows the approximate site location.

SITE AND PROJECT DESCRIPTION

Figure 2, Site Plan, shows the proposed wine cave area and portals diagramically; refer to the current project plans for the proposed new wine cave layout. The proposed cave project will consist of constructing a 20,720 sf wine cave with three portals using entirely cut-and-cover methods. Note that our 2014 report included considerations for portions of the cave possibly being constructed using tunneling methods. The new cave will be designated as a Type 2 Winery Cave, per Section 446 of the California Building Code.

The portals will be located along a new winery building wall approximately 260 feet in length. The proposed caves will be 36 feet wide and 16 feet high. The rough cave area dimensions are 230 feet by 113 feet; the maximum travel distance from the back of the cave to the exterior of the adjacent building is approximately 235 feet. At the currently proposed portals, there is approximately a 9-foot elevation difference between the proposed finished floor (elevation ±113 feet) and the existing ground surface; at the back of the caves there is approximately a 20-foot elevation difference between the proposed finished floor and the existing ground surface. Soil material from the cave area cuts will be used as fill over the top of the cut-and-cover caves.

The cave area excavation will require cuts up to about 22 feet deep, which will be temporarily shored during construction. The cave structures will include cast-in-place foundations, stem walls and concrete slabs, and pre-cast tunnel arch segments.

If the project plans change and the geotechnical aspects of the project vary significantly from those described, then Condor should be notified and reevaluate our conclusions and recommendations in this report.

SCOPE OF WORK

Condor's scope of work was presented in our September 3, 2013 Proposal (Task 1 and 2) and consisted of the following:

- Investigated ground conditions by drilling four vertical borings to depths that extend to more than 10 feet below the level of the proposed tunnel floor at adjacent tunnel locations, and by excavating five test pits near the proposed shotcrete retaining wall.
- Installed a piezometer in boring B-3 to permit subsequent measurement of groundwater levels and monitoring of ground temperature (see Figure 2).
- Tested selected samples of soil and rock to measure relevant index and engineering properties.
- Prepared this report that presents the following:
  - Vicinity Map
  - Site Plan showing existing site topography, the proposed cave, approximate boring locations and approximate test pit locations
  - Boring and Test Pit Logs
  - Photographs of retrieved core
  - Laboratory test reports
  - Description of site geology and seismicity
  - Discussion of general surface and subsurface conditions, including groundwater
  - Preliminary conclusions regarding anticipated subsurface conditions to be exposed in proposed excavations for the wine cave and portals (and variability of such conditions), including rock structure, weathering, rock fracture, characteristics, rock unconfined compressive strength, rock hardness, and RQD.
  - Conclusions regarding geotechnical issues for design and construction, including the following:
    - Anticipated ground temperatures and cave operating temperatures (at various portions of the cave)
    - General tunnel ground characteristics (and variability depending on ground over and variation of rock characteristics)
    - Excavatability of rock
    - Potential for groundwater seepage and options for water seepage mitigation
    - Tunnel stability and unsupported stand-up time
    - Anticipated tunnel advance rates and requirements for temporary support
    - Estimated tunnel liner requirements

SITE AND SUBSURFACE INVESTIGATION METHODS

Condor investigated subsurface conditions at the site on November 4 and 5, 2013 by drilling four borings (B-1, B-2, B-3 and B-4) to depths of about 20, 33, 43 and 20 feet respectively. A track-mounted CME-55 drill rig and both auger and core drilling techniques were used.

A Condor staff geologist visually logged the earth materials encountered during drilling and directed the sampling of soil and rock. Five test pits were excavated on November 5, 2013 to depths of about 3 to 7 feet. Figure 2 shows the approximate boring and test pit locations. Boring and test pit logs with the descriptions

and classifications of rock properties are attached in Appendix A. Appendix B contains photographs of the core.

Soil samples were recovered with PQ core or with 3-inch outside diameter split-spoon samplers driven 18 inches (or to practical refusal) over three 6-inch increments. The split-spoon samplers were driven into the ground using a 140-pound hammer dropped 30 inches by an automatically tripped hammer system. The boring logs show, at the appropriate depths, the field blow counts for each 6-inch drive. When refusal occurred, the logs show the blows required to drive the sampler over the final increment, and the number of inches driven over this final increment. Condor visually classified soils using the Unified Soil Classification System and characterized the engineering properties of the rock. Condor delivered soil and rock samples to our laboratories (including subcontracted laboratories) for further examination and testing. We performed unconfined compressive strength, plasticity index and triaxial shear tests. Appendix C contains the laboratory test reports.

After drilling, B-1, B-2 and B-4 were backfilled with lean cement grout, and a piezometer (groundwater level monitoring well) was installed in B-3. Test pits were filled in with excavated material and tamped down with backhoe bucket.

SITE GEOLOGY

Available geologic maps indicate that rock in the project vicinity belongs to the Franciscan Complex Mélange dating approximately late Cretaceous to Early Jurassic. This unit includes dominantly metamorphosed rocks, including greywacke, shale and serpentinite. The project site is mapped within the Franciscan Central Belt mélange, designated "KJfm" on Figure 3, Geologic Map. The subsurface data indicates that the Franciscan Mélange at the site is serpentinite. Although Figure 4, Ultramafic Map, does not indicate that there is ultramafic rock at this project site, it was encountered during drilling.

The Subsurface Conditions section of this report presents additional information.

SITE SEISMICITY

This site is located in a seismically active area of California in an area of regional faulting. Figure 5, Regional Fault Map, shows that the nearest active fault (Rodgers Creek Fault) is about 5.5 miles from the project site. The site is also about 3.5 miles away from a potentially active fault, special study zone according to the Healdsburg Quadrangle map from the website of Department of Conservation, California (http://www.quake.ca.gov/ gmaps/WH/regulatorymaps.htm). Because the site is not located near any active faults, Condor concludes that the risk of surface rupture from faulting is considered low.

SITE CONDITIONS

The pertinent aspects of the site conditions are shown on Figure 2. The proposed caves occupy a hillside sloping to the northeast from an existing vineyard down to a pond and buildings. The ground surface inclination is about 12 horizontal to 1 vertical (12:1). At the time of our investigation, few trees and very short grass covered the ground surface. An area below the proposed cave was graded to accommodate several buildings, including a house and two barns.

SUBSURFACE CONDITIONS

The subsurface data indicates that the ground surface at the site is underlain by, from top to bottom, the following:

- Natural soil to depths of about 7 feet
- Up to about 7 feet of old alluvium (only near the base of the slope)
- Up to about 7 feet of completely weathered shale
- Serpentinite extending to the maximum depth drilled of about 43 feet

The natural soil is stiff to very stiff silty clay with moderate to high plasticity. The old alluvium is very dense sandy silt to medium stiff to hard sandy clay with rounded gravel and moderate plasticity. The shale is completely weathered, crushed, soft and friable. The serpentinite is slightly to moderately weathered, and often sheared. Tests indicate that it has an intact unconfined compressive strength ranging from about 18 to 64 pounds per square inch (psi). It tends to be clayey in places with some resealed fracture and shear surfaces. Visual observation of the serpentinite samples revealed the presence of fibers within the rock. The fibers could be naturally occurring asbestos, but we did not perform the necessary laboratory testing to confirm (not in our work scope).

Condor interpreted the soil and bedrock conditions based on the field and laboratory data. The contacts between soil and rock types shown on the logs are approximate and some may be gradational, while others are sharp. Subsurface conditions are likely to vary with location.

GROUND TEMPERATURE AND GROUNDWATER MEASUREMENTS

On November 14, 2013 and June 12, 2014, Condor performed borehole monitoring to investigate the subsurface ground temperature and groundwater conditions. A thermal couple probe (together with backup thermometer) and water depth sounder were used to measure subsurface ground temperatures and water levels in one exploration borehole that was converted to a piezometer. The following data were recorded:

Depth	Nov 2013	June 2014
Surface air	57	77
10-ft	64	63
20-ft	61	62
30-ft	60	61
40-ft	60	61

November 14, 2013 – Groundwater encountered at a depth of 16.9 feet.
June 12, 2014 – Groundwater encountered at a depth of 12 feet.

CONCLUSIONS AND RECOMMENDATIONS

Based on review of the subsurface data and our engineering evaluation, Condor concludes that construction of the proposed wine cave is feasible, but that for much of the site, caves constructed using cut-and-cover methods are more suitable than tunnels.

OVERALL DISCUSSION AND CONCLUSIONS

Conventionally, wine caves are mined using mechanical excavation equipment such as road headers, and the tunnel heights are about 12 feet. Based on our evaluation, Condor concludes that these conventional

mining techniques could be executed where there is at least 4 feet of ground cover over the proposed tunnel crown. Therefore, mining may be feasible for this project, for 12-foot high tunnels, where the existing ground surface is about 16 feet higher than the proposed tunnel invert. Because the proposed invert finish-floor elevation is about 113 feet, only a very limited area would be available for mining (area beyond the el. 129 contour).

The subsurface data indicates that the tunneling ground is "poor" (classification based on Bieniawski, 1988). Therefore, standup times will be relatively short, and we anticipate that rapid placement of temporary support will be required. In addition, groundwater seepage together with clayey ground may result in "very poor" ground and tunnel invert stability problems in some areas. For the reasons described, Condor suggests that using cut-and-cover techniques and instead of tunneling may be more practical for this project. Advantages of using cut-and-cover techniques are that they would allow more flexibility for constructing wider tunnels and tunnels that are more closely spaced.

One significant issue for constructing cut-and-cover caves is maintaining adequate horizontal setback of the proposed caves from the adjacent property line to allow for temporary cutslopes with adequate stability. Temporary cutslopes up to about 22 feet high will be required to excavate the site down to elevation ±113 feet. Based on our evaluation, Condor preliminarily concludes that cutslopes up to 22 feet high may need surface inclinations as flat as 1.75 horizontal to 1 vertical (1.75:1) because the rock exposed will be relatively weak. Where there is not adequate setback for temporary cutslopes, perhaps as much as 40 feet for this project, then temporary shoring will be required to support a lower portion of the cut. The most appropriate shoring type will likely be reinforced shotcrete retaining walls with soil nails.

The rock in proposed excavations will include serpentinite, and we consider it likely that naturally occurring asbestos (NOA) will be present. Therefore, excavation and grading should be performed in accordance with the California Air Resources Board (CARB) Air Toxic Control Measure Final Regulation Order, Asbestos Airborne Toxic Control Measure for Construction, Grading, Quarrying, and Surface Mining Operations, dated July 29, 2002. The presence of serpentine requires either following Airborne Toxic Control Measures (ATCMs) during earthwork, or as an alternative performing an extensive sampling and testing program to justify applying for an exemption to CARB to allow not following ATCMs. Because of the high investigation cost that is required to apply for exemption and the likelihood that the investigation will result in the need to follow ATCMs, Condor recommends following ATCMs during earthwork. Requirements for ATCMs consist of special earthwork construction procedures to reduce airborne NOA, engineering control/air monitoring during earthwork to protect workplace safety and reporting to the CARB. Such requirements would apply to both open excavation for cut-and-cover and tunneling methods.

GROUND TEMPERATURES

Based on our evaluation of preliminary data, Condor anticipates that the natural long-term cave operating temperature will average about 62°F and will fluctuate ±5 to 8 degrees because of seasonal variations (due to relatively low ground cover) and operating activities, including lighting. Therefore, we recommend that a thermal break between the cave structure and the surrounding ground, and mechanical cooling should be considered.

GROUND CONDITIONS

Based on our review of the data and our evaluation, Condor anticipates that mass excavation will expose up to 8 feet of colluvium, old alluvium, and shale over serpentinite. The colluvium and old alluvium will consist of medium stiff to hard fat clay and lean clay, and very dense sandy silt. The shale will be highly weathered and will have the consistency of very dense silty sand with gravel. The serpentinite will likely be moderately to highly weathered, sheared and clayey in some places.

TUNNELING GROUND

Condor anticipates that any mining performed for the project will encounter ground classified as "poor" to "very poor" with relatively short stand up time. There is significant potential for encountering rock blocks bound by intersecting shear planes with fall potential. Such blocks may present a significant hazard, and they may pose the potential for caving in and daylighting the cave. There will also be ground susceptible to raveling exposed at mined tunnel crown. Rapidly installing steel ribs, rock bolting, or other temporary support measures may be required to support such blocks and unstable ground.

GROUNDWATER

Based on our review of available subsurface data and our experience, Condor concludes groundwater seepage through the natural ground and into the cave zone is likely, and that mitigation would be required to address nuisance water seepage. Water inflow will be more problematic where perched water is encountered and moderate inflows are expected in some areas. For cut-and-cover caves, the potential for groundwater seepage into the caves is reduced because the exterior of these structures would be drained.

Because of the potential for groundwater behind the tunnels, tunnel liner quality and seepage mitigation are important design and construction considerations. An effective and practical method to reduce seepage into the tunnels is by placing regularly spaced prefabricated drain strips between the ground and tunnel liner and a 4-inch diameter perforated subdrain (or larger subdrain) beneath the tunnel floor slabs, coupled with a water seepage mitigation membrane in the shotcrete liner. For cut-and-cover caves, subdrains could be placed at ground exposed at open cutslopes, and the structures would be waterproofed on the outside prior to burial.

Concrete mixes and placement requirements should be also designed to reduce groundwater transmission.

Cut-and cover cave floors can be essentially flat, with local drainage and sloped subsurface drain pipes. Tunnel floors should slope at 1.5 to 2 percent toward the portals for gravity drainage of the collected seepage water.

Condor should re-evaluate requirements for seepage mitigation after we observe and evaluate exposed ground conditions during construction.

TUNNEL SUPPORT

Based on our review of the available subsurface data and our preliminary evaluation, Condor preliminarily concludes that mined tunnels that are 14-feet wide will require reinforced shotcrete liners that are at least 8-inches thick. Wider cut-and cover caves may require 10- to 12-inch or thicker concrete arches. Condor should re-evaluate the tunnel liner requirements during the final design stage.

CONSTRUCTION CONSIDERATIONS

Condor anticipates that advanced rates for tunnels mining using mechanical excavation will be relatively low because of the weak and sheared ground, relatively short stand up time, and the associated need for relatively short excavation rounds, shoring, and rapid placement of initial support. Based on our experience, we anticipate advance rates of 2 to 4 feet per heading per day (for a typical 14-foot wide by 12-foot high tunnel excavation heading), depending on the Contractor's means and methods, and ground conditions. The Contractor should place initial support based on their experience and observations of the actual ground conditions.

Where there is low ground cover and soil is exposed in the tunnel crown, the Contractor should be prepared to excavate in shorter rounds and to place initial shotcrete soon after exposing the ground to reduce the risk of caving and daylighting.

Condor anticipates that the serpentinite exposed along tunnel inverts and soil subgrades will soften from groundwater seepage and equipment traffic during construction, and that it will deflect and rut under equipment. For mined tunnels, at least footings and likely curved reinforced concrete subinverts will be required. Overexcavation and placement of lean concrete mud slabs may also be appropriate to stabilize subgrades of mined tunnels to facilitate construction. For soil subgrades beneath cut-and-cover tunnels, overexcavation and placement of aggregate with or without a geotextile beneath it may be appropriate.

Relatively light compaction equipment will be required for compaction of backfill beside and above cut-and-cover caves to reduce stresses imposed on the structures.

Because the ground exposed in open cuts will be relatively weak, relatively low excavation lifts may be required for constructing shotcrete retaining walls to maintain adequate temporary stability. In addition, rapid placement of initial shotcrete may be required.

Condor should re-evaluate the stability of excavations for open cuts and mined tunnels during construction. The Contractor is responsible for tunnel support for construction safety and maintaining the stability of temporary cutslopes. Condor should determine the requirements for final liners of mined tunnels by observing and evaluating conditions of exposed ground and site conditions, excavation methods, and by consulting with the Contractor (the Owner's representative). We anticipate that monitoring of ground movements of mined tunnels will be required for our evaluation.

ADDITIONAL SERVICES

Because subsurface conditions will vary and the level of this study was limited in scope and detail, it is impossible to include all geotechnical design and construction considerations. In addition, recommendations used as a basis of construction details are sensitive to a need for additional field information or adjustment in the field during construction. The adjustments are also dependent upon findings during construction that could previously only be assumed based on the limited information. Because the intent of the recommendations within this report are best understood by Condor representatives, we recommend that future phases of cave geostructural work, including field engineering, inspection, and testing during shotcrete retaining wall/tunnel construction, be performed or directed by Condor. If Condor is not retained for future phases of work, the responsible professionals should thoroughly review this report and concur with its conclusions and recommendations or provide alternative recommendations.

LIMITATIONS

The conclusions and recommendations contained in this preliminary evaluation report are for planning and preliminary design of the proposed Ramey Wine Cave project. Additional services and recommendations will be required for final design and construction. The conclusions and recommendations contained in this report are invalid if the assumed project or site conditions change, if this report is used for adjacent or other property, or if the recommendations contained in ADDITIONAL SERVICES are not followed.

This report provides an initial evaluation of the anticipated site and tunneling conditions. The evaluation included field observations and literature review prior to the start of site subsurface exploration. Information contained in this report is intended to describe anticipated subsurface conditions that may be encountered and recommend appropriate actions to address those conditions. Geologic data obtained by Condor to date are not necessarily representative for all areas of the proposed caves because subsurface conditions vary.

Because actual conditions encountered vary, recommendations provided herein should be verified during construction.

A detailed review of site permit requirements or other regulatory constraints is beyond the scope of this report. In addition, information contained in this report shall not relieve the Contractor(s) of their responsibility for jobsite safety practices.
This report was prepared in accordance with the generally accepted standards of geologic and engineering practice that exist in Sonoma County at the time the report was written. No other warranty, express or implied, is made.

Changes in the standards of practice in the field of engineering, geology and geotechnical engineering changes in site conditions such as new excavations or fills, new agency regulations, or modifications to the proposed project warrant professional review of this report. Because of these factors, there is a practical limit to the usefulness of this report without critical professional review. It is suggested that 2 years be considered a reasonable time for the validity of this report update.

CONDOR EARTH TECHNOLOGIES, INC.

LOG LEGEND AND SOIL CLASSIFICATION

WEATHERING

Severely Weathered – minerals decomposed to soil, but rock fabric and structure are preserved.
Highly Weathered – abundant fractures coated with oxides, carbonates, sulphates, mud, etc., thorough discoloration, rock disintegration, mineral decomposition.
Moderately Weathered – some fracture coating, moderate or localized discoloration, little to no effect on cementation, slight mineral decomposition.
Slightly Weathered – a few stained fractures, slight discoloration, little or no effect on cementation, no mineral decomposition.
Fresh – unaffected by weathering agents; no appreciable change with depth.

FRACTURE, JOINT, OR SHEAR SPACING

(Spacing in Inches)

Very little fractured	Greater than 48
Occasionally fractured	12 to 48
Moderately fractured	6 to 12
Closely fractured	1.25 to 6
Intensely fractured	0.5 to 1.25
Crushed	Less than 0.5

THICKNESS OF SEDIMENTARY ROCK BEDS

(Thickness in Inches)

Very thickly bedded	Greater than 72
Thickly bedded	24 to 72
Medium bedded	8 to 24
Thinly bedded	2.5 to 8
Very thinly bedded	0.75 to 2.5
Laminated	0.25 to 0.75
Thinly laminated	Less than 0.25

FRACTURE OR LAYER SEPARATION

(Thickness of Separations in Millimeters)

Very tight	< 0.1 mm
Tight	0.1 – 0.5 mm
Moderately open	0.5 – 2.5 mm
Open	2.5 – 10 mm
Very wide	> 10 mm

FRACTURE OR LAYER ROUGHNESS

Very Rough - Non-continuous, Hard joint rock wall
Slightly Rough - Hard joint rock wall
Slightly Rough and Soft - Soft joint rock wall
Slickensided - Open and continuous with gouge
Soft Gouge - Open and continuous with soft gouge

STRUCTURE

Intact/Massive – intact rock specimens with few widely spaced discontinuities.
Blocky – well interlocked, undisturbed rock mass, consisting of cubical blocks formed by three intersecting joint sets.
Very blocky – interlocked, partially disturbed, with multi-faceted angular blocks formed by 4 or more joint sets.
Disturbed/Seamy – folded with angular blocks, formed by many intersecting joint sets, persistence of bedding planes or schistosity.
Disintegrated – poorly interlocked, heavily broken, mix of angular and rounded rock pieces.
Laminated/Sheared – lack of blockiness due to close spacing of shear planes.

STRENGTH

Plastic or very low strength.
Friable – crumbles easily by rubbing with fingers.
Weak – an unfractured specimen of such material will crumble under light hammer blows.
Moderately strong – specimen will withstand a few heavy hammer blows before breaking.
Strong – specimen will withstand a few heavy ringing hammer blows and will yield with difficulty only dust and small flying fragments.
Very strong – specimen will resist heavy ringing hammer blows and will yield with difficulty only dust and small flying fragments.

HARDNESS

Soft – reserved for plastic material alone.
Low hardness – can be gouged deeply or carved easily with a knife blade.
Moderately hard – can be readily scratched by a knife blade; scratch leaves a heavy trace of dust and is readily visibly after the powder has been blown away.
Hard – can be scratched with difficulty; scratch produced a little powder and is often faintly visible.
Very hard – cannot be scratched with knife blade; leaves a metallic streak.

GRAPHIC LOG

DESCRIPTION

COLLUVIUM - SANDY LEAN CLAY (CL) - with some gravel. Brown, dry, moderate plasticity, very stiff
Red-Brown, damp, more silty, very stiff, moderate plasticity,
Coarse sand in red-brown clay matrix (crushed shale/mudstone)
5'; w = 32.6 γd = 87 Su = 7,070

FRANCISCAN COMPLEX - MALANGE - SERPENTINITE
Light green, weak to Friable, low hardness, Highly weathered, blocky - seamy
Orange-brown, extremely weathered, crushed
Grey-green, crushed to seamy and sheared Highly weathered, low hardness, parting, some re-sealed fracture, but mostly too soft for fracture.

Mudstone clasts ~ 2.5", rounded to sub-angular weak to Friable, low hardness
3.5" mudstone gravel, moderately hard, low strength, blocky to seamy with some re-sealed fractures.
21.5: LL = NV PI = NP F = 17.0

24.5: LL = 74 PI = 35 F = 14.8, γd = 70, one dimensional Expansion test
Dark green, low hardness to soft, rare fracture, blocky Texture (mudstone cobbles in clayey serpentinite)

Dark green to black, soft, weak, crushed to sheared
30.5'; w = 13.4 γd = 124 Su = 2,150
Soft to moderate hardness, weak, sheared, re-sealed shear surfaces, no true fracture

Dark grey - black, very soft, very weak to friable sheared to clay (could be some shale inclusions)
33'; γd = 133.7 pcf qu = 64 psi youngs modulus = 2.172 E+02 w = 9.8%
Moderately hard, moderately strong, some shear, mostly very blocky to massive, mod - high weathering,

Dark green, soft to moderately hard, weak, seamy to very blocky in places, clayey

Boring Terminated at 43 feet

DESCRIPTION

COLLUVIUM - FAT CLAY (CL) - red-brown, very, stiff, moderate to high plasticity.

OLD ALLUVIUM - SANDY SILT - tan, dry, very stiff, mod-low plasticity

SANDY CLAY with GRAVEL - Tan brown to orange, dry, stiff, contains some sub-angular and some rounded gravel

GRAVEL in CLAY MATRIX - fat clay with gravel, dark brown, mod-high plasticity, soft

3.5: LL=64, PI=44 c=39.4, hydrometer

FRANCISCAN COMPLEX - MALANGE - SERPENTINITE

Dark brown to tan, Extremely weathered, crushed to angular coarse sand, blocky, soft, weak

Grey-green to light green, soft, weak, seamy with some resealed fracture (or shear planes) clayey in some places

Soft to moderately hard, weak, seamy

very clayey

14': LL=54 PI=15 w=42.6, γd=80

Black, low to moderate hardness, weak, sheared, (likely contains some shale inclusions, sheared)

Dark green, soft, weak, sheared, some mudstone coarse gravel to cobbles. LL=NV, PI=NP, F=40.9

Boring Terminated at 20 feet

Calculating Young's Modulus by Secant Modulus Method:

1. Assume fixed percentage of maximum compressive strength: 70%
2. Solving for Axial Strain, $\Delta\varepsilon_a$ @ 70% of maximum compressive strength:

$$\Delta\varepsilon_a = \varepsilon_{a2}-\{[(\sigma_2-\Delta\sigma)*(\varepsilon_{a2}-\varepsilon_{a1})]/(\sigma_2-\sigma_1)\}$$

3. Solving for Young's Modulus using the Secant Modulus Method:

$$\text{Young's Modulus} \quad E_s = \frac{\Delta\sigma}{\Delta\varepsilon_a}$$

David Ramey
Ramey Vineyards, LLC.
PO Box 788
Healdsburg, CA 95448

Subject: **Wine Cave Design and Construction**
Licensing Requirements
Ramey Wine Cellars
7097 Westside Road
Healdsburg, California

Dear Mr. Ramey:

As requested, Condor Earth (Condor) herein provides clarification of current design and construction licensing requirements for the subject proposed Wine Cave.

The proposed cave will be constructed using cut-and-cover methods, which means that a temporary surface excavation will be made, a structure will be constructed, and the structure will be buried. The result will be a subterranean structure. There will be no significant difference, design and construction licensing wise, for this structure compared to a typical surface structure. Engineering components of the cave structure (civil grading, geotechnical, structural, mechanical, electrical, etc.) will be designed by California-licensed engineers, and the construction components will be built by California-licensed contractors. Licensing requirements for tunneling will not apply to this project.

Please contact Condor if you have any questions or if you require additional information.

Respectfully submitted,

CONDOR EARTH

TABLE OF CONTENTS (cont'd)

APPENDICES

INTRODUCTION

This report presents the results of our geotechnical study for the planned winery to be constructed at 7097 Westside Road in Healdsburg, California. The property extends over gently sloping terrain on both the west and east sides of Westside Road, and contains a historic hop-kiln facility, a rural residence, a caretaker residence and several farm buildings. The site location is shown on Plate 1, Appendix A.

We understand it is proposed to construct a new winery production area on the west side of Westside Road with a crush pad and production area on the base level, and offices, a kitchen and tasting areas upstairs. Wine storage caves with four portals will be constructed west of the new winery building. The caves will be evaluated and designed by another firm. On the east side of Westside Road, improvements include renovation of some of the existing structures and improvements to the driveway and parking.

Foundation loads are expected to be typical of the light to moderately heavy type of construction proposed. We anticipate wall loads will range from ¾ to 2 kips per lineal foot. Site grading will include the minimum amount needed to provide elevated building pads, parking and driveways with positive drainage, with a significant cut (10 to 15 feet) at the cave portal wall.

Utility plans are not available, but we have assumed for this study that the project utilities will extend no deeper than 15 feet below the existing ground surface. If project utilities extend deeper, supplemental exploration may be required to evaluate the soil and bedrock conditions within and below the utility excavations.

SCOPE

The purpose of our study, as outlined in our Professional Service Agreement dated August 20, 2013, and revised on September 24, 2013 and October 16, 2013, was to generate geotechnical information for the design and construction of the project. Our scope of services included reviewing selected published geologic data pertinent to the site; evaluating subsurface conditions with borings and laboratory tests; analyzing the field and laboratory data; and presenting this report with the following geotechnical information:

1. A brief description of soil, bedrock and groundwater conditions observed during our study;
2. A discussion of seismic hazards that may affect the proposed improvements; and
3. Conclusions and recommendations regarding:
    a. Primary geotechnical engineering concerns and mitigating measures, as applicable;
    b. Site preparation and grading including remedial grading of weak, porous, compressible and/or expansive, creep-prone surface soils;
    c. Foundation type(s), design criteria, and estimated settlement behavior;
    d. Lateral loads for retaining wall design;

e. Support of concrete slabs-on-grade;

f. Preliminary pavement thickness based on our experience with similar soils and projects and the results of R-value tests on the anticipated subgrade soils;

g. Utility trench backfill;

h. Geotechnical engineering drainage improvements; and

i. Supplemental geotechnical engineering services.

STUDY

Site Exploration

We reviewed our previous geotechnical studies in the vicinity and selected geologic references pertinent to the site. The geologic literature reviewed is listed in Appendix B.

On December 4, 2013, we performed a geotechnical reconnaissance of the site and explored the subsurface conditions by drilling 8 borings to depths ranging from about 4 to 15 feet. The borings were drilled with a truck-mounted drill rig equipped with 6-inch diameter, solid stem augers at the approximate locations shown on the Exploration Plan, Plate 2. The boring locations were determined approximately by pacing their distance from features shown on the Exploration Plan and should be considered accurate only to the degree implied by the method used. Our geologist located and logged the borings and obtained samples of the materials encountered for visual examination, classification and laboratory testing.

Relatively undisturbed samples were obtained from the borings at selected intervals by driving a 2.43-inch inside diameter, split spoon sampler, containing 6-inch long brass liners, using a 140-pound hammer dropping approximately 30 inches. The sampler was driven 12 to 18 inches. The blows required to drive each 6-inch increment were recorded and the blows required to drive the last 12 inches, or portion thereof, were converted to equivalent Standard Penetration Test (SPT) blow counts using a conversion factor of 0.65 (Burmister, 1948) for correlation with empirical data. Disturbed samples were also obtained at selected depths by driving a 1.375-inch inside diameter (2-inch outside diameter) SPT sampler, without liners or rings, using a 140-pound hammer dropping approximately 30 inches. The sampler was driven 12 to 18 inches, the blows to drive each 6-inch increment were recorded, and the blows required to drive the final 12 inches, or portion thereof, are provided on the boring logs. Disturbed "bulk" samples were also obtained at selected depths from the borings and placed in buckets.

The logs of the borings showing the materials encountered, groundwater conditions, converted blow counts and sample depths are presented on Plates 3 through 10. The soils are described in accordance with the Unified Soil Classification System, outlined on Plate 11. Bedrock is described in accordance with Engineering Geology Rock Terms, shown on Plate 12.

The boring logs show our interpretation of subsurface soil, groundwater, and bedrock conditions on the date and at the locations indicated. Subsurface conditions may vary at other locations and times. Our interpretation is based on visual inspection of soil and bedrock samples, laboratory test results, and interpretation of drilling and sampling resistance. The location of the soil and bedrock boundaries should be considered approximate. The transition between soil and bedrock types may be gradual.

Laboratory Testing

The samples obtained from the borings were transported to our office and re-examined to verify soil classifications, evaluate characteristics and assign tests pertinent to our analysis. Selected samples were laboratory tested to determine their classification (Atterberg Limits, percent of silt and clay), expansion potential (Expansion Index - EI) and R-value. The test results are presented on the boring logs. Results of the classification and R-value tests are presented on Plates 13 through 16.

SITE CONDITIONS

General

Sonoma County is located within the California Coast Range geomorphic province. This province is a geologically complex and seismically active region characterized by sub-parallel northwest-trending faults, mountain ranges and valleys. The oldest bedrock units are the Jurassic-Cretaceous Franciscan Complex and Great Valley sequence sediments originally deposited in a marine environment. Subsequently, younger rocks such as the Tertiary-age Sonoma Volcanics group, the Plio-Pleistocene-age Clear Lake Volcanics and sedimentary rocks such as the Guinda, Domengine, Petaluma, Wilson Grove, Cache, Huichica and Glen Ellen formations were deposited throughout the province. Extensive folding and thrust faulting during late Cretaceous through early Tertiary geologic time created complex geologic conditions that underlie the highly varied topography of today. In valleys, the bedrock is covered by thick alluvial soils.

Geology

Published geologic maps (Delattre, 2011) indicate the property is underlain by early to late Pleistocene age older alluvial deposits along the eastern portion of the site, and the Late Cretaceous to Early Jurassic age Franciscan Central Belt mélange along the western portion of the site. The older alluvial deposits are described as uplifted or deeply dissected older alluvium, fan and terrace deposits. The Franciscan Central Belt mélange is described as a tectonic mixture of penetratively sheared argillite and greywacke that forms a matrix around more coherent rock masses of varied lithology.

Landslides

A published landslide map (Huffman, 1980) indicates a possible large-scale landslide at the site, however a more recent geologic map (Delattre, 2011), which does depict large-scale landslides, does not indicate active landslides at the site. We did not observe active landslides at the site during our study.

Surface

The property extends primarily over gently sloping terrain. The vegetation consists of vineyards, mature landscaping and annual grasses. In general, the ground surface is moderately hard. However, soils in the area that appear hard and strong when dry will typically lose strength rapidly and settle under the loads of fills, foundations and slabs as their moisture content increases and approaches saturation. This typically occurs because the surface soils are weak, porous and compressible. Natural drainage consists of sheet flow over the ground surface slopes that concentrates in man-made surface drainage elements such as roadside ditches, canals and gutters, and natural drainage elements such as swales, ravines, and creeks.

Subsurface

Our borings and laboratory tests indicate that the portion of the site we studied is blanketed by ¼ to 2 feet of weak, porous, compressible, clayey soils. Porous soils appear hard and strong when dry but become weak and compressible as their moisture content increases towards saturation. These surface materials are underlain by clayey to sandy alluvial and residual soils to depths ranging from 0 to greater than 5 feet below the ground surface. These soils exhibit low plasticity with localized areas of high plasticity (LL = 25 - 50; PI = 8 - 35) and very low to moderate expansion potential (EI = 7 - 84).

Franciscan Formation mélange, and serpentinite bedrock extends from beneath the surface materials to the maximum depths explored (15 feet). The mélange is extremely closely fractured, soft to hard, plastic to moderately strong and slightly to highly weathered. The serpentinite was found to be closely fractured to intensely sheared, firm to moderately hard, weak to moderately strong and moderately weathered. A detailed description of subsurface conditions found in our borings is given on Plates 3 through 10, Appendix A. Based on Table 20.3-1 of the American Society of Civil Engineer's "Minimum Design Loads for Buildings and Other Structures" (2010), we have determined a Site Class of C should be used for the site.

Corrosion Potential

Mapping by the Natural Resources Conservation Service (2013) indicates that the corrosion potential of the near surface soil is low to moderate for uncoated steel and low for concrete. Performing corrosivity tests to verify these values was not part of our requested and/or proposed scope of work. Should the need arise, we would be pleased to provide a proposal to evaluate these characteristics.

Groundwater

Free groundwater was not observed in our borings at the time of drilling. Fluctuation in the groundwater level typically occurs because of a variation in rainfall intensity, duration and other factors such as flooding and periodic irrigation. In the Healdsburg area, the groundwater level can rise from a few to several feet during prolonged periods of rainfall and impact excavations not only on a short term basis (during construction) but also during the life of the project. Excavation dewatering is discussed in more detail in the Conclusions section of this report.

Flooding

Our review of the Federal Emergency Management Agency (FEMA) Flood Zone Map for Sonoma County, California, and Incorporated Areas (NO. 06097C0563E) dated December 12, 2008, indicates that a portion of the proposed reconstruction of the existing hop-kilns is located within Zone "X", shaded, which is an area within the 500-year flood zone. Immediately downslope and within approximately 60 feet of the existing hop-kilns is the boundary with Zone "AE", the 100-year flood zone with base flood elevations determined. The remainder of the site is within Zone "X", and area outside the 500-year floodplain. Evaluation of flooding potential is typically the responsibility of the project civil engineer.

DISCUSSION AND CONCLUSIONS

Seismic Hazards

General

We did not observe subsurface conditions within the portion of the property we studied that would suggest the presence of materials that may be susceptible to seismically induced densification or liquefaction. Therefore, we judge the potential for the occurrence of these phenomena at the site to be low.

Seismicity

Data presented by the Working Group on California Earthquake Probabilities (2007) estimates the chance of one or more large earthquakes (Magnitude 6.7 or greater) in the San Francisco Bay region within the next 30 years to be approximately 63 percent. Therefore, future seismic shaking should be anticipated at the site. It will be necessary to design and construct the proposed improvements in strict adherence with current standards for earthquake-resistant construction.

Faulting

We did not observe landforms within the area that would indicate the presence of active faults and the site is not within a current Alquist-Priolo Earthquake Fault Zone (Bryant and Hart, 2007). Therefore, we believe the risk of fault rupture at the site is low. However, the site is within an area affected by strong seismic activity. Several northwest-trending Earthquake Fault Zones exist in close proximity to and within several miles of the site (Bortugno, 1982). The shortest distances from the site to the mapped surface expression of these faults are presented in the table below.

[redacted]

Fault	Direction	Distance-Miles
San Andreas	SW	16
Healdsburg-Rodgers Creek	NE	5¼
West Napa	SE	28¼
Maacama	NE	9¼
Konocti	NE	26½
Hunting Creek	NE	31

Lurching

Seismic slope failure or lurching is a phenomenon that occurs during earthquakes when slopes or man-made embankments yield and displace in the unsupported direction. Provided the foundations are installed as recommended herein, we judge the potential for impact to the proposed improvements from the occurrence of this phenomenon at the site is low. However, some of these secondary earthquake effects are unpredictable as to location and extent, as evidenced by the 1989 Loma Prieta Earthquake.

Geotechnical Issues

General

Based on our study, we judge the proposed improvements can be built as planned, provided the recommendations presented in this report are incorporated into their design and construction. The primary geotechnical concerns during design and construction of the project are:

1. The presence of ¼ to 2 feet of weak, porous, compressible, expansive, clayey surface soils that is locally expansive;
2. The detrimental effects of uncontrolled surface runoff and groundwater seepage on the long-term satisfactory performance of the project, especially when constructed on hillsides and flood plains, given the erosion potential and porous nature of the surface soils; and
3. The strong ground shaking predicted to impact the site during the life of the project.

Weak, Porous Surface Soils

Weak, porous surface soils, such as those found at the site, appear hard and strong when dry but will lose strength rapidly and settle under the load of fills, foundations, slabs, and pavements as their moisture content increases and approaches saturation. The moisture content of these soils can increase as the result of rainfall, periodic irrigation or when the natural upward migration of water vapor through the soils is impeded by, and condenses under fills, foundations, slabs, and pavements. The detrimental effects of such movements can be reduced by strengthening the soils during grading. This can be achieved by excavating the weak soils and replacing them as properly compacted (engineered) fill. Alternatively, satisfactory foundation support could be obtained below the weak surface soils.

Foundation, Slab and Pavement Support - After remedial grading, satisfactory foundation support for the planned winery can be obtained from spread footings bottomed on select engineered fill and/or firm, undisturbed bedrock at least 12 inches below pad subgrade. Interior slab-on-grade floors, exterior slabs and pavements can also be satisfactorily supported on the engineered fill. Where building pads transition from bedrock to engineered fill, the fill should be compacted to at least 95 percent relative compaction.

Expansive Soil - Locally the surface soils are expansive. Expansive surface soils shrink and swell as they lose and gain moisture throughout the yearly weather cycle. Near the surface, the resulting movements can heave and crack lightly loaded shallow foundations (spread footings) and slabs and pavements. The zone of significant moisture variation (active layer) is dependent on the expansion potential of the soil and the extent of the dry season. In the site area, the active layer is generally considered to range in thickness from about 1 to 2 feet.

Excavation Difficulty

Site excavation will encounter hard, resistant bedrock a few feet below the surface. Site excavations, including utility trenches will require heavy ripping and jack hammering. The contractors and subcontractors bidding this job should read this report and become familiar with site conditions as they pertain to their operation and the appropriate equipment needed to perform their tasks. If more detailed information regarding excavatability of the bedrock is required, a seismic refraction study should be performed or additional test pits should be excavated using the type and size of equipment planned for construction.

Exterior Slabs and Pavements

Exterior slabs and pavements will heave and crack as the expansive soils shrink and swell through the yearly weather cycle. Slab and pavement cracking and distress are typically concentrated along edges where moisture content variation is more prevalent within subgrade soils. Slab and pavement performance and the incidence of repair can be reduced, but not eliminated, by covering the pre-swelled expansive soils with at least 12 inches of select fill (see "On-Site Soil Quality" section) prior to constructing the slab or pavement required to carry the anticipated traffic.

On-Site Soil Quality

All fill materials used in the building area and the upper 12 inches of exterior slab and pavement subgrade must be select, as subsequently described in "Recommendations." We anticipate that, with the exception of organic matter and of rocks or lumps larger than 6 inches in diameter, the excavated expansive soil will be suitable for re-use as general fill, but will not be suitable for use as select fill.

Select Fill

The select fill can consist of approved on-site soils or import materials with a low expansion potential. The geotechnical engineer must approve the use of on-site soils as select fill during grading.

Settlement

If remedial grading is performed and the spread footings are installed in accordance with the recommendations presented in this report, we estimate that post-construction differential settlements across the building will be about ½ inch.

Surface Drainage

Because of topography and location, the site will be impacted by surface runoff from the upgradient slopes. In addition, the site soils are susceptible to erosion and sloughing. Surface runoff typically sheet flows over the ground surface slopes but can be concentrated by the planned site grading, landscaping, and drainage. The surface runoff can pond against structures and seep into the slab rock. Therefore, strict control of surface runoff is necessary to provide long-term satisfactory performance of projects constructed on or near hillsides and floodplains. It will be necessary to divert surface runoff around improvements, provide positive drainage away from structures, and install energy dissipaters at discharge points of concentrated runoff. This can be achieved by constructing the building pad several inches above the surrounding area and conveying the runoff into man made drainage elements or natural swales that lead downgradient of the site.

Groundwater

We anticipate that rainwater will percolate through the porous topsoil and migrate downslope at the interface of the topsoil and bedrock and through fractures in the bedrock and seep into the slab rock. Groundwater will also seep into excavations exposing the water migration zone. Therefore, it will be necessary to intercept, collect and divert groundwater outside of the proposed improvements. This can be accomplished by installing perimeter foundation drains and slab underdrains as recommended herein.

Serpentinite Bedrock Grading

Borings B-5 and B-6 encountered serpentinite bedrock at or near the ground surface. This bedrock will be exposed during grading and can contain naturally occurring asbestos fibers. There are State enforced regulations giving specific measures that must be used during grading to mitigate hazards associated with airborne asbestos particles. We suggest that you retain certified asbestos personnel to sample and test the site soils and bedrock. We can provide assistance in contracting with these personnel.

RECOMMENDATIONS

Seismic Design

Seismic design parameters presented below are based on Section 1613 titled “Earthquake Loads” of the 2013 California Building Code (CBC). Based on Table 20.3-1 of the American Society of Civil Engineers (ASCE) Standard 7-10, titled “Minimum Design Loads for Buildings and Other Structures” (2010), we have determined a Site Class C should be used for the subject site. Using a site latitude and longitude of 38.5218°N and 122.8666°W, respectively, and the US Seismic Design Maps from the United States Geological Survey (USGS) website (http://geohazards.usgs.gov/designmaps/us/application.php), we recommend that the following seismic design criteria be used for structures at the site.

[redacted]

Spectral Response Parameter	Acceleration (g)
S_S (0.2 second period)	1.500
S_1 (1 second period)	0.600
S_{MS} (0.2 second period)	1.500
S_{M1} (1 second period)	0.780
S_{DS} (0.2 second period)	1.000
S_{D1} (1 second period)	0.520

Grading

Site Preparation

Areas to be developed should be cleared of vegetation and debris including that left by the removal of obsolete structures. Trees and shrubs that will not be part of the proposed development should be removed and their primary root systems grubbed. Cleared and grubbed material should be removed from the site and disposed of in accordance with County Health Department guidelines. We did not observe septic tanks, leach lines or underground fuel tanks during our study. Any such appurtenances found during grading should be capped and sealed and/or excavated and removed from the site, respectively, in accordance with established guidelines and requirements of the County Health Department. Voids created during clearing should be backfilled with engineered fill as recommended herein.

Stripping

Areas to be graded should be stripped of the upper few inches of soil containing organic matter. Soil containing more than two percent by weight of organic matter should be considered organic. Actual stripping depth should be determined by a representative of the geotechnical engineer in the field at the time of stripping. The strippings should be removed from the site, or if suitable, stockpiled for re-use as topsoil in landscaping.

Excavations

Following initial site preparation, excavation should be performed as planned or recommended herein. Excavations extending below the proposed finished grade should be backfilled with suitable materials compacted to the requirements given below.

Within building areas, where spread footings bottomed at minimum depth are chosen for foundation support, and within fill and interior slab-on-grade areas, the weak, porous, compressible expansive surface soils should be excavated to within 6 inches of their entire depth about 0 to 1½ feet in our borings. The excavation of weak, compressible, expansive soils should also extend at least 12 inches below exterior slab and pavement subgrade (where planned excavations do not completely remove the weak soils) to allow space for the installation of the select fill blanket discussed in the conclusions section of this report.

The excavation of weak, porous, compressible, expansive surface materials should extend at least 5 feet beyond the outside edge of the exterior footings of the proposed buildings and 3 feet beyond the edge of exterior slabs and pavements. The excavated materials should be stockpiled for later use as compacted fill, or removed from the site, as applicable. Excavation of hard resistant bedrock at the site may require heavy ripping and/or jack hammering. The grading contractor should review this report, become familiar with site conditions as they pertain to his operation and draw his own conclusions regarding excavation difficulty and suitable grading equipment.

At all times, temporary construction excavations should conform to the regulations of the State of California, Department of Industrial Relations, Division of Industrial Safety or other stricter governing regulations. The stability of temporary cut slopes, such as those constructed during the installation of underground utilities, should be the responsibility of the contractor. Depending on the time of year when grading is performed, and the surface conditions exposed, temporary cut slopes may need to be excavated to 1½:1, or flatter. The tops of the temporary cut slopes should be rounded back to 2:1 in weak soil zones.

Fill Quality

All fill materials should be free of perishable matter and rocks or lumps over 6 inches in diameter, meet the criteria set forth herein for select fill and must be approved by the geotechnical engineer prior to use. We judge the on-site soils are generally suitable for use as general fill. Serpentinite bedrock encountered within the winery location may be suitable for reuse as select fill. The suitability of the on-site soils for use as select fill should be verified during grading.

Select Fill

Select fill should be free of organic matter, have a low expansion potential, and conform in general to the following requirements:

SIEVE SIZE	PERCENT PASSING (by dry weight)
6 inch	100
4 inch	90 – 100
No. 200	10 – 60

Liquid Limit – 40 Percent Maximum
Plasticity Index – 15 Percent Maximum
R-value – 20 Minimum (pavement areas only)

In general, imported fill, if needed, should be select. Material not conforming to these requirements may be suitable for use as import fill; however, it shall be the contractor's responsibility to demonstrate that the proposed material will perform in an equivalent manner. The geotechnical engineer should approve imported materials prior to use as compacted fill. The grading contractor is responsible for submitting, at least 72 hours (3 days) in advance of its intended use, samples of the proposed import materials for laboratory testing and approval by the soils engineer.

Fill Placement

The surface exposed by stripping and removal of weak, compressible, expansive surface soils should be scarified to a depth of at least 6 inches, uniformly moisture-conditioned to near optimum and compacted to at least 90 percent of the maximum dry density of the materials as determined by ASTM Test Method D-1557. In expansive soil areas, moisture conditioning should be sufficient to completely close all shrinkage cracks for their full depth within pavement, exterior slab and building areas. If grading is performed during the dry season, the shrinkage cracks may extend to a few feet below the surface. Therefore, it may be necessary to excavate a portion of the cracked soils to obtain the proper moisture condition and degree of compaction. Approved fill material should then be spread in thin lifts, uniformly moisture-conditioned to near optimum and properly compacted. All structural fills, including those placed to establish site surface drainage, should be compacted to at least 90 percent relative compaction. Expansive soils used as fill should be moisture-conditioned to at least 4 percent above optimum. Only approved select materials should be used for fill.

[redacted]

Area	Compaction Recommendation (ASTM D-1557)
Preparation for areas to receive fill	After preparation in accordance with this report, compact upper 6 inches to a minimum of 90 percent relative compaction.
General fill (native or import)	Compact to a minimum of 90 percent relative compaction.
Structural fill beneath buildings, extending outward to 5' beyond building perimeter	Compact to a minimum of 90 percent relative compaction. Compact to a minimum of 95 percent where building pad transitions between bedrock and fill.
Structural fill beneath building pads that transition between bedrock and fills less than 3 feet thick	Compact to a minimum of 95 percent relative compaction.
Trenches	Compact to a minimum of 90 percent relative compaction. Compact the top 6 inches below vehicle pavement subgrade to a minimum of 95 percent relative compaction.
Retaining wall backfill	Compact to a minimum of 90 percent relative compaction, but not more than 95 percent.
Pavements, extending outward to 3' beyond edge of pavement	Compact upper 6 inches of subgrade to a minimum of 95 percent relative compaction.
Concrete flatwork and exterior slabs, extending outward to 3' beyond edge of slab	Compact subgrade to a minimum of 90 percent relative compaction. Where subject to vehicle traffic, compact upper 6 inches of subgrade to at least 95 percent relative compaction.
Aggregate Base	Compact aggregate base to at least 95 percent relative compaction.

Permanent Cut and Fill Slopes

In general, cut and fill slopes should be designed and constructed at slope gradients of 2:1 (horizontal to vertical) or flatter, unless otherwise approved by the geotechnical engineer in specified areas. Areas that expose expansive clay will need to be laid back to 3:1. Where steeper slopes are required, retaining walls should be used. The geotechnical engineer is not responsible for measuring the angles of these slopes. Denuded slopes should be planted with fast-growing, deep-rooted groundcover to reduce sloughing or erosion. The cut and fill slope inclinations recommended herein address only the stability of the slopes. It should not be inferred that they address the feasibility of landscaping and weed control. Where these are concerns, the slopes should be flattened accordingly.

Wet Weather Grading

Generally, grading is performed more economically during the summer months when on-site soils are usually dry of optimum moisture content. Delays should be anticipated in site grading performed during the rainy season or early spring due to excessive moisture in on-site soils. Special and relatively expensive construction procedures, including dewatering of excavations and importing granular soils, should be anticipated if grading must be completed during the winter and early spring or if localized areas of soft saturated soils are found during grading in the summer and fall.

Open excavations also tend to be more unstable during wet weather as groundwater seeps towards the exposed cut slope. Severe sloughing and occasional slope failures should be anticipated. The occurrence of these events will require extensive clean up and the installation of slope protection measures, thus delaying projects. The general contractor is responsible for the performance, maintenance and repair of temporary cut slopes.

Serpentinite Bedrock Grading

If serpentinite bedrock is encountered during grading, a certified asbestos professional must be retained to collect and test samples for the presence of naturally occurring asbestos. If asbestos is detected, measures to mitigate the health hazards to workers associated with airborne asbestos fiber particles generated during grading should be implemented. These should include consulting with the regulatory agencies, preparing a work plan and verifying this plan is implemented.

Foundation Support

Spread Footings

Spread footings should be at least 12 inches wide and should bottom on select engineered fill or on undisturbed bedrock, as applicable, at least 12 inches below pad subgrade. Additional embedment or width may be needed to satisfy code and/or structural requirements. On ungraded sloping terrain, the footings should be stepped as necessary to produce level tops and bottoms. Footings should be deepened as necessary to provide at least 7 feet of horizontal confinement between the footing bottoms and the face of the nearest slope. Confinement in bedrock can be reduced to 5 feet.

The bottoms of all footing excavations should be thoroughly cleaned out or wetted and compacted using hand-operated tamping equipment prior to placing steel and concrete. This will remove the soils disturbed during footing excavations, or restore their adequate bearing capacity, and reduce post-construction settlements. Footing excavations should not be allowed to dry before placing concrete. If shrinkage cracks appear in soils exposed in the footing excavations, the soil should be thoroughly moistened to close all cracks prior to concrete placement. The moisture condition of the foundation excavations should be checked by the geotechnical engineer no more than 24 hours prior to placing concrete.

Bearing Pressures - Footings installed in accordance with these recommendations may be designed using allowable bearing pressures of 2000, 3000 and 4000 pounds per square foot (psf), for dead loads, dead plus code live loads, and total loads (including wind and seismic), respectively. For footings bottomed entirely on bedrock, the above pressures can be increased to 3000, 4500 and 6000 psf.

Lateral Pressures - The portion of spread footing foundations extending into undisturbed bedrock or select engineered fill may impose a passive equivalent fluid pressure and a friction factor of 350 pcf and 0.35, respectively, to resist sliding. Passive pressure should be neglected within the upper 6 inches, unless the soils are confined by concrete slabs or pavements.

Retaining Walls

Retaining walls discussed herein do not include the cave portal wall which will be evaluated by another firm. Retaining walls constructed at the site must be designed to resist lateral earth pressures plus additional lateral pressures that may be caused by surcharge loads applied at the ground surface behind the walls. Retaining walls free to rotate (yielding greater than 0.1 percent of the wall height at the top of the backfill) should be designed for active lateral earth pressures. If walls are restrained by rigid elements to prevent rotation, they should be designed for "at rest" lateral earth pressures. In the absence of backdrains, the retaining walls should be designed to resist full hydrostatic pressure.

Retaining walls should be designed to resist the following earth equivalent fluid pressures (triangular distribution):

Loading Condition	Pressure (pcf)	Additional Seismic Pressure (pcf)*
Active - Level Backfill	40	13
Active - Sloping Backfill 3:1 or Flatter	51	25
At Rest - Level Backfill	65	31

* If required

These pressures do not consider additional loads resulting from adjacent foundations or other loads. If these additional surcharge loadings are anticipated, we can assist in evaluating their effects. Where retaining wall backfill is subject to vehicular traffic, the walls should be designed to resist an additional surcharge pressure equivalent to two feet of additional backfill.

Retaining walls will yield slightly during backfilling. Therefore, walls should be backfilled prior to building on, or adjacent to, the walls. Backfill against retaining walls should be compacted to at least 90 and not more than 95 percent relative compaction. Over-compaction or the use of large compaction equipment should be avoided because increased compactive effort can result in lateral pressures higher than those recommended above.

Foundation Support

Retaining walls should be supported on spread footings designed in accordance with the recommendations presented in this report. Retaining wall foundations should be designed by the project civil or structural engineer to resist the lateral forces set forth in this section.

Wall Drainage and Backfill

Retaining walls should be backdrained as shown on Plate 17, Appendix A. The backdrains should consist of 4-inch diameter, rigid perforated pipe embedded in Class 2 permeable material. The pipe should be PVC Schedule 40 or ABS with SDR 35 or better, and the pipe should be sloped to drain to outlets by gravity. The top of the pipe should be at least 8 inches below lowest adjacent grade. The Class 2 permeable material should extend to within 1½ feet of the surface. The upper 1½ feet should be backfilled with compacted soil to exclude surface water. Retaining walls designed to resist full hydrostatic pressure do not need to be backdrained. Expansive soils should not be used for wall backfill. Where expansive soils are present in the excavation made to install the retaining wall, the excavation should be sloped back 1:1 from the back of the footing or grade beam. The ground surface behind retaining walls should be sloped to drain. Where migration of moisture through retaining walls would be detrimental, retaining walls should be waterproofed.

Slab-On-Grade

Provided grading is performed in accordance with the recommendations presented herein, interior and exterior slabs should be underlain by undisturbed bedrock and/or select engineered fill. Slab-on-grade subgrade should be rolled to produce a dense, uniform surface. The future expansion potential of the subgrade soils should be reduced by thoroughly presoaking the slab subgrade prior to concrete placement. The moisture condition of the subgrade soils should be checked by the geotechnical engineer no more than 24 hours prior to placing the capillary moisture break. The slabs should be underlain with a capillary moisture break consisting of at least 4 inches of clean, free-draining crushed rock or gravel (excluding pea gravel) at least ¼-inch and no larger than ¾-inch in size. Interior slabs subject to vehicular traffic may be underlain by Class 2 aggregate base. The use of Class 2 aggregate base should be reviewed on a case by case basis. Class 2 aggregate base can be used for slab rock under exterior slabs. Interior area slabs should be provided with an underdrain system. The installation of this subdrain system is discussed in the "Geotechnical Drainage" section.

Slabs should be designed by the project civil or structural engineer to support the anticipated loads, reduce cracking and provide protection against the infiltration of moisture vapor.

A vapor barrier should be placed under all slabs-on-grade that are likely to receive an impermeable floor finish or be used for any purpose where the passage of water vapor through the floor is undesirable. RGH does not practice in the field of moisture vapor transmission evaluation or mitigation. Therefore, we recommend that a qualified person be consulted to evaluate the general and specific moisture vapor transmission paths and any impact on the proposed construction. This person should provide recommendations for mitigation of the potential adverse impact of moisture vapor transmission on various components of the structure as deemed appropriate.

Utility Trenches

The shoring and safety of trench excavations is solely the responsibility of the contractor. Attention is drawn to the State of California Safety Orders dealing with "Excavations and Trenches."

Unless otherwise specified by the County of Sonoma, on-site, inorganic soil may be used as general utility trench backfill. Where utility trenches support pavements, slabs and foundations, trench backfill should consist of aggregate baserock. The baserock should comply with the minimum requirements in Caltrans Standard Specifications, Section 26 for Class 2 Aggregate Base. Trench backfill should be moisture-conditioned as necessary, and placed in horizontal layers not exceeding 8 inches in thickness, before compaction. Each layer should be compacted to at least 90 percent relative compaction as determined by ASTM Test Method D-1557. The top 6 inches of trench backfill below vehicle pavement subgrades should be moisture-conditioned as necessary and compacted to at least 95 percent relative compaction. Jetting or ponding of trench backfill to aid in achieving the recommended degree of compaction should not be attempted.

Pavements

As discussed previously, the driveway is locally underlain by expansive soils. R-values ranged from 7 to 35 on bulk samples collected from the near surface soils. Due to the inconsistencies in the subgrade soils across the site we recommend that the upper 12 inches of subgrade soil consist of select fill with a minimum R-value of 20. Based on this minimum R-value, we have computed pavement sections for Traffic Indices (TI) ranging from 5.0 to 7.0 in the table below. The project engineer, in consultation with the County officials, should choose the pertinent Traffic Index for this project.

TI	ASPHALT CONCRETE (feet)	CLASS 2 AGGREGATE BASE (feet)	IMPORTED SELECT FILL* (feet)
7.0	0.30	1.15	1.0
6.0	0.25	1.05	1.0
5.0	0.20	0.90	1.0

* R-value ≥ 20

Pavement thicknesses were computed using Caltrans CalFP v1.1 design software and are based on a pavement life of 20 years. These recommendations are intended to provide support for traffic represented by the indicated Traffic Indices. They are not intended to provide pavement sections for heavy concentrated construction storage or wheel loads such as forklifts, parked truck-trailers and concrete trucks (or for post-construction concentrated wheel loads such as self-loading dumpster trucks).

Because of the expansion potential of the soil and bedrock at the site and the difficulty in controlling seasonal moisture variation beneath and adjacent to the driveway, significant cracking may develop in the pavement even if 12-inches of select fill is installed. Increasing the thickness of select fill or installing moisture cutoffs may reduce but not eliminate the potential for cracks to develop. It should be understood that pavements will likely require regular maintenance including crack sealing and the aesthetics may not be desirable.

In areas where heavy construction storage and wheel loads are anticipated, the pavements should be designed to support these loads. Support could be provided by increasing pavement sections or by providing reinforced concrete slabs. Alternatively, paving can be deferred until heavy construction storage and wheel loads are no longer present.

Prior to placement of aggregate base, the upper 6 inches of the pavement subgrade soils should be scarified, uniformly moisture-conditioned to near optimum, and compacted to at least 95 percent relative compaction to form a firm, non-yielding surface.

Aggregate base materials should be spread in thin layers, uniformly moisture-conditioned, and compacted to at least 95 percent relative compaction to form a firm, non-yielding surface. The materials and methods used should conform to the requirements of the County of Sonoma and the current edition of the Caltrans Standard Specifications, except that compaction requirements should be based on ASTM Test Method D-1557. Aggregate used for the base course should comply with the minimum requirements specified in Caltrans Standard Specifications, Section 26 for Class 2 Aggregate Base.

Porous/Permeable Surface Treatments

Because porous surface treatments are designed to allow water to drain through to the underlying subgrade, standard design procedures are not applicable because standard concrete, dense-graded asphalt and Class 2 aggregate base rock do not allow drainage. There is no established design procedure or known lifetime performance for porous travel surfaces. In addition, porous concrete and pavement are not typically as durable as standard concrete and dense-graded asphalt. Therefore, if porous surface treatments are used, it should be understood that regular maintenance and repair may be required and will be on-going through the life of the paved area. In addition, porous surface treatments are suitable for light automobile traffic only and should be avoided in areas where heavy wheel loads, such as self-loading dumpster trucks, are anticipated.

Parking Lot Drainage

Water tends to migrate under pavements and collect in the aggregate courses at low areas on parking lot subgrade soils, such as around storm drain inlets and the thread of paved swales leading to inlets. The ponded water will soften subgrade soils and, under repetitive heavy-wheel loads, will induce inordinately high stresses on the subgrade and pavement components that could result in untimely maintenance. Under-pavement drainage can be improved and maintenance reduced by replacing a 12-inch wide strip (extending at least 15 feet on either side of the inlet) of the select subbase layer or subgrade soils with a subdrain consisting of ¾-inch or 1½-inch free-draining Class 1 Permeable Material. The drain rock should be outletted into the storm drain inlet. Storm drain trenches can be made to serve as pavement subdrains. We should be consulted to verify the suitability of storm drain trenches as pavement subdrains in a case-specific basis.

Where pavements will abut landscaped areas, the pavement baserock layer and subgrade soils should be protected against saturation from irrigation and rainwater with a subdrain, similar to that previously discussed. The subdrain should extend to a depth of at least 6 inches below the bottom of the baserock layer. Alternatively, a grouted moisture cut-off that extends 12 inches below the bottom of the baserock layer should be provided below or immediately behind the curb and gutter.

Wet Weather Paving

In general, the pavements should be constructed during the dry season to avoid the saturation of the subgrade and base materials, which often occurs during the wet winter months. If pavements are constructed during the winter, a cost increase relative to drier weather construction should be anticipated. Unstable areas may have to be overexcavated to remove soft soils. The excavations will probably require backfilling with imported crushed (ballast) rock. The geotechnical engineer should be consulted for recommendations at the time of construction.

Geotechnical Drainage

Surface

Surface water should be diverted away from slopes, foundations and edges of pavements. Surface drainage gradients should slope away from building foundations in accordance with the requirements of the CBC or local governing agency. Where a gradient flatter than 2 percent for paved areas and 4 percent for unpaved areas is required to satisfy design constraints, area drains should be installed with a spacing no greater than about 20 feet. Roofs should be provided with gutters and the downspouts should discharge directly onto paved areas or be connected to closed (glued Schedule 40 PVC or ABS with SDR of 35 or better) conduits discharging well away from foundations, onto erosion resistant natural drainages or into the site's surface drainage system. Roof downspouts and surface drains must be maintained entirely separate from the slab underdrains recommended hereinafter.

Water seepage or the spread of extensive root systems into the soil subgrade of footings, slabs or pavements could cause differential movements and consequent distress in these structural elements. Landscaping should be planned with consideration for these potential problems.

Slab Underdrains

Where interior slab subgrades are less than 6 inches above adjacent exterior grade and where migration of moisture through the slab would be detrimental, slab underdrains should be installed to dispose of surface and/or groundwater that may seep and collect in the slab rock. Slab underdrains should consist of 6-inch wide trenches that extend at least 6 inches below the bottom of the slab rock and slope to drain by gravity. The slab underdrain trenches should be spaced no further than 15 feet, both ways. Additional drain trenches should be installed, as necessary, to drain all isolated under slab areas. Four-inch diameter perforated pipe (SDR 35 or better) sloped to drain to outlets by gravity should be placed in the bottom of the trenches. Slab underdrain trenches should be backfilled to subgrade level with clean, free draining slab rock. An illustration of this system is shown on Plate 18. If slab underdrains are not used, it should be anticipated that water will enter the slab rock, permeate through the concrete slab and ruin floor coverings.

Maintenance

Periodic land maintenance will be required. Surface and subsurface drainage facilities should be checked frequently, and cleaned and maintained as necessary or at least annually. A dense growth of deep-rooted ground cover must be maintained on all slopes to reduce sloughing and erosion. Sloughing and erosion that occurs must be repaired promptly before it can enlarge.

Supplemental Services

Pre-Bid Meeting

It has been our experience that contractors bidding on the project often contact us to discuss the geotechnical aspects. Informal contacts between RGH and an individual contractor could result in incomplete or misinterpreted information being provided to the contractor. Therefore, we recommend a pre-bid meeting be held to answer any questions about the report prior to submittal of bids. If this is not possible, questions or clarifications regarding this report should be directed to the project owner or their designated representative. After consultation with RGH, the project owner or their representative should provide clarifications or additional information to all contractors bidding the job.

Plan and Specifications Review

Coordination between the design team and the geotechnical engineer is recommended to assure that the design is compatible with the soil, geologic and groundwater conditions encountered during our study. RGH Consultants (RGH) recommends that we be retained to review the project plans and specifications to determine if they are consistent with our recommendations. In the event we are not retained to perform this recommended review, we will assume no responsibility for misinterpretation of our recommendations.

Construction Observation and Testing

Prior to construction, a meeting should be held at the site that includes, but is not limited to, the owner or owner's representative, the general contractor, the grading contractor, the foundation contractor, the underground contractor, any specialty contractors, the project civil engineer, other members of the project design team and RGH. This meeting should serve as a time to discuss and answer questions regarding the recommendations presented herein and to establish the coordination procedure between the contractors and RGH.

In addition, we should be retained to monitor all soils related work during construction, including:

- Site stripping, over-excavation, grading, and compaction of near surface soils;
- Placement of all engineered fill and trench backfill with verification field and laboratory testing;
- Observation of all foundation excavations; and
- Observation of foundation and subdrain installations.

If, during construction, we observe subsurface conditions different from those encountered during the explorations, we should be allowed to amend our recommendations accordingly. If different conditions are observed by others, or appear to be present beneath excavations, RGH should be advised at once so that these conditions may be evaluated and our recommendations reviewed and updated, if warranted. The validity of recommendations made in this report is contingent upon our being notified and retained to review the changed conditions.

If more than 18 months have elapsed between the submission of this report and the start of work at the site, or if conditions have changed because of natural causes or construction operations at, or adjacent to, the site, the recommendations made in this report may no longer be valid or appropriate. In such case, we recommend that we be retained to review this report and verify the applicability of the conclusions and recommendations or modify the same considering the time lapsed or changed conditions. The validity of recommendations made in this report is contingent upon such review.

These supplemental services are performed on an as-requested basis and are in addition to this geotechnical study. We cannot accept responsibility for items that we are not notified to observe or for changed conditions we are not allowed to review.

LIMITATIONS

This report has been prepared by RGH for the exclusive use of Ramey Vineyards, LLC and their consultants as an aid in the design and construction of the proposed improvements described in this report.

The validity of the recommendations contained in this report depends upon an adequate testing and monitoring program during the construction phase. Unless the construction monitoring and testing program is provided by our firm, we will not be held responsible for compliance with design recommendations presented in this report and other addendum submitted as part of this report.

Our services consist of professional opinions and conclusions developed in accordance with generally accepted geotechnical engineering principles and practices. We provide no warranty, either expressed or implied. Our conclusions and recommendations are based on the information provided to us regarding the proposed construction, the results of our field exploration, laboratory testing program, and professional judgment. Verification of our conclusions and recommendations is subject to our review of the project plans and specifications, and our observation of construction.

The borings represent subsurface conditions at the locations and on the date indicated. It is not warranted that they are representative of such conditions elsewhere or at other times. Site conditions and cultural features described in the text of this report are those existing at the time of our field exploration on December 4, 2013, and may not necessarily be the same or comparable at other times.

The scope of our services did not include an environmental assessment or a study of the presence or absence of toxic mold and/or hazardous, toxic or corrosive materials in the soil, surface water, groundwater or air (on, below or around this site), nor did it include an evaluation or study for the presence or absence of wetlands. These studies should be conducted under separate cover, scope and fee and should be provided by a qualified expert in those fields.

COLUMN DESCRIPTIONS

1 Elevation (feet): Elevation (MSL, feet).
2 Depth (feet): Depth in feet below the ground surface.
3 Sample Type: Type of soil sample collected at the depth interval shown.
4 Sampling Resistance, blows/ft: Number of blows to advance driven sampler one foot (or distance shown) beyond seating interval using the hammer identified on the boring log.
5 Graphic Log: Graphic depiction of the subsurface material encountered.
6 MATERIAL DESCRIPTION: Description of material encountered. May include consistency, moisture, color, and other descriptive text.
7 Dry Density (pcf): Dry density, in pcf.
8 Water Content (%): Water content, percent.
9 % <#200 Sieve: % <#200 Sieve
10 PI, %: Plasticity Index, expressed as a water content.
11 LL, %: Liquid Limit, expressed as a water content.
12 Expansion Index (EI): Expansion Index (EI)
13 UC, psf: Unconfined compressive strength, in pounds per square foot.
14 REMARKS AND OTHER TESTS: Comments and observations regarding drilling or sampling made by driller or field personnel.

FIELD AND LABORATORY TEST ABBREVIATIONS

CHEM: Chemical tests to assess corrosivity
COMP: Compaction test
CONS: One-dimensional consolidation test
LL: Liquid Limit, percent
PI: Plasticity Index, percent
SA: Sieve analysis (percent passing No. 200 Sieve)
UC: Unconfined compressive strength test, Qu, in psf
WA: Wash sieve (percent passing No. 200 Sieve)

OTHER GRAPHIC SYMBOLS

—▽	Water level (at time of drilling, ATD)
—▼	Water level (after waiting)
↴	Minor change in material properties within a stratum
— —	Inferred/gradational contact between strata
—?—	Queried contact between strata

GENERAL NOTES

1: Soil classifications are based on the Unified Soil Classification System. Descriptions and stratum lines are interpretive, and actual lithologic changes may be gradual. Field descriptions may have been modified to reflect results of lab tests.
2: Descriptions on these logs apply only at the specific boring locations and at the time the borings were advanced. They are not warranted to be representative of subsurface conditions at other locations or times.

SOIL CLASSIFICATION AND KEY TO TEST DATA

Ramey Winery
7097 Westside Road
Healdsburg, California

Plate
11

LAYERING

MASSIVE	Greater than 6 feet
THICKLY BEDDED	2 to 6 feet
MEDIUM BEDDED	8 to 24 inches
THINLY BEDDED	2½ to 8 inches
VERY THINLY BEDDED	¾ to 2½ inches
CLOSELY LAMINATED	¼ to ¾ inches
VERY CLOSELY LAMINATED	Less than ¼ inch

JOINT, FRACTURE, OR SHEAR SPACING

VERY WIDELY SPACED	Greater than 6 feet
WIDELY SPACED	2 to 6 feet
MODERATELY SPACED	8 to 24 inches
CLOSELY SPACED	2½ to 8 inches
VERY CLOSELY SPACED	¾ to 2½ inches
EXTREMELY CLOSELY SPACED	Less than ¼ inch

HARDNESS

Soft - pliable; can be dug by hand
Firm - can be gouged deeply or carved with a pocket knife
Moderately Hard - can be readily scratched by a knife blade; scratch leaves heavy trace of dust and is readily visible after the powder has been blown away
Hard - can be scratched with difficulty; scratch produces little powder and is often faintly visible
Very Hard - cannot be scratched with pocket knife, leaves a metallic streak

STRENGTH

Plastic - capable of being molded by hand
Friable - crumbles by rubbing with fingers
Weak - an unfractured specimen of such material will crumble under light hammer blows
Moderately Strong - specimen will withstand a few heavy hammer blows before breaking
Strong - specimen will withstand a few heavy ringing hammer blows and usually yields large fragments
Very Strong - rock will resist heavy ringing hammer blows and will yield with difficulty only dust and small flying fragments

DEGREE OF WEATHERING

Highly Weathered - abundant fractures coated with oxides, carbonates, sulphates, mud, etc., thorough discoloration, rock disintegration, mineral decomposition
Moderately Weathered - some fracture coating, moderate or localized discoloration, little to no effect on cementation, slight mineral decomposition
Slightly Weathered - a few stained fractures, slight discoloration, little or no effect on cementation, no mineral composition
Fresh - unaffected by weathering agents; no appreciable change with depth

Notes:

1. Drain rock should meet the requirements for Class 2 Permeable Material, Section 68, State of California "Caltrans" Standard Specification, latest edition. Drain rock should be placed to approximately three-quarters the height of the retaining wall.

2. Pipe should conform to the requirements of Section 68 of State of California "Caltrans" Standards, perforations placed down, sloped at 1% for gravity flow to outlet or sump with automatic pump. The pipe invert should be located at least 8 inches below the lowest adjacent finished surface.

3. During construction the contractor should use appropriate methods such as temporary bracing and/or light compaction equipment to avoid overstressing the walls. Non-expansive soils to be used as backfill.

4. Slope excavation back at a 1:1 gradient from the back of footing where expansive materials are exposed.

Not to Scale

Geotechnical Engineering Report Update
Ramey Winery
7097 Westside Road
Healdsburg, California

Project Number: 3053.01.06.1

The purpose of this letter is to update our previous geotechnical report for the project to current design standards. The results of our geotechnical study for the site were presented in our report dated January 27, 2014. On October 18, 2018, we performed a brief reconnaissance of the site and noted that the site surface conditions have not changed significantly since our report was issued.

Based on our review and reconnaissance, it is our opinion that the recommendations in our report are valid for design and construction of the improvements. We understand that some of the planned features may have shifted and that a new sound wall is being planned. We reviewed the architectural plans for the project that show a print date of September 21, 2018. Attached is the subject plan showing our subsurface exploration points.

With code changes, seismic design criteria can change. Current seismic design parameters are based on Section 1613 titled "Earthquake Loads" of the 2016 California Building Code (CBC). Based on Table 20.3-1 of American Society of Civil Engineers (ASCE) Standard 7-10, titled "Minimum Design Loads for Buildings and Other Structures" (2010), we confirmed that a Site Class of C should be used for the site. Using a site latitude and longitude of 38.5218°N and 122.8666°W, respectively, the design maps from the United States Geological Survey (USGS), and the website https://www.seismicmaps.org/, we determined that the seismic design criteria presented in our report are still valid for this project. We have represented them below.

2016 CBC Seismic Criteria

Spectral Response Parameter	Acceleration (g)
S_S (0.2 second period)	1.500
S_1 (1 second period)	0.600
S_{MS} (0.2 second period)	1.500
S_{M1} (1 second period)	0.780
S_{DS} (0.2 second period)	1.000
S_{D1} (1 second period)	0.520

We trust this provides the information you require at this time. If you have questions please call.

Very truly yours,

SONOMA

County of Sonoma
Permit & Resource Management Department

MEMO

DATE: **August 22, 2017**

TO: **Traci Tesconi, Supervising Planner**

FROM: **Becky VerMeer, Environmental Health Specialist-Project Review**

SUBJECT: **Truck Sizes as defined by the Transportation's Federal Highway Administration**

Trucks as defined by (empty) weight in categories of Light, Medium and Heavy and by the Dept. of Transportation's Federal Highway Administration (FHWA) classifications:

Light Trucks: Passenger cars and small trucks

Up to 14,000 lbs

FHWA classes 1-3

5 lug wheel hub (depending on the year of the vehicle, more hubs =heavier duty suspension and load capacity)

Medium Trucks: Box truck, Van, Flatbed truck, Fire truck (may be Heavy Trucks too), RV, Ford F-650 Medium Duty, Delivery truck, Cutaway van chassis, Bottler

14,001 lbs -26,000 lbs.

FHWA classes 4-6

6-8 lug wheel hubs

Heavy Trucks:

26,001- 33,000 lbs. Garbage trucks, Dump trucks, Tank Truck, Tractor Unit, Mobile Crane, Cement Mixer Truck, Ford F-750, Semi trucks, 18 wheelers,

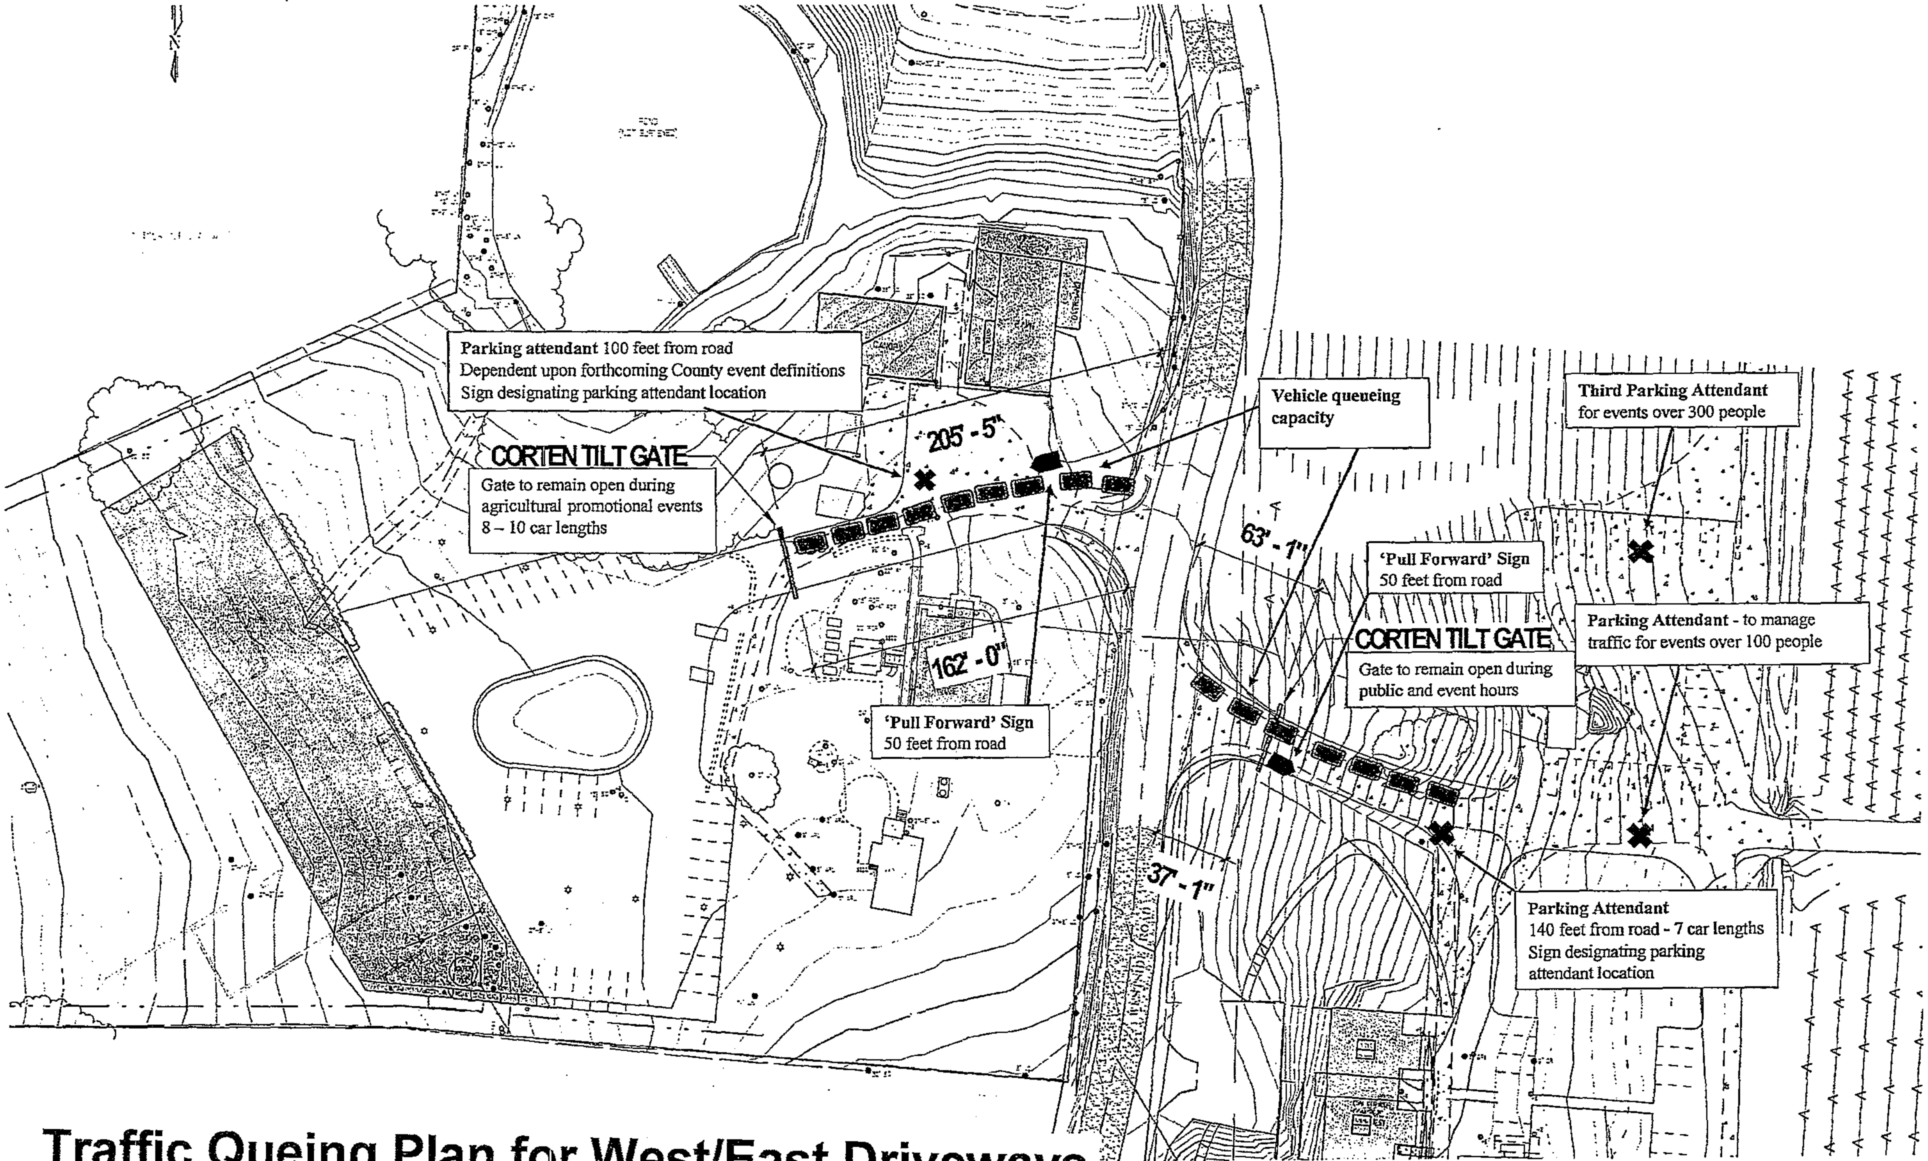
FHWA classes 7-8

Requires a Class B Commercial Driver's License for non-combo vehicles or Class A Commercial Driver License for combo vehicles (tractor-trailers)

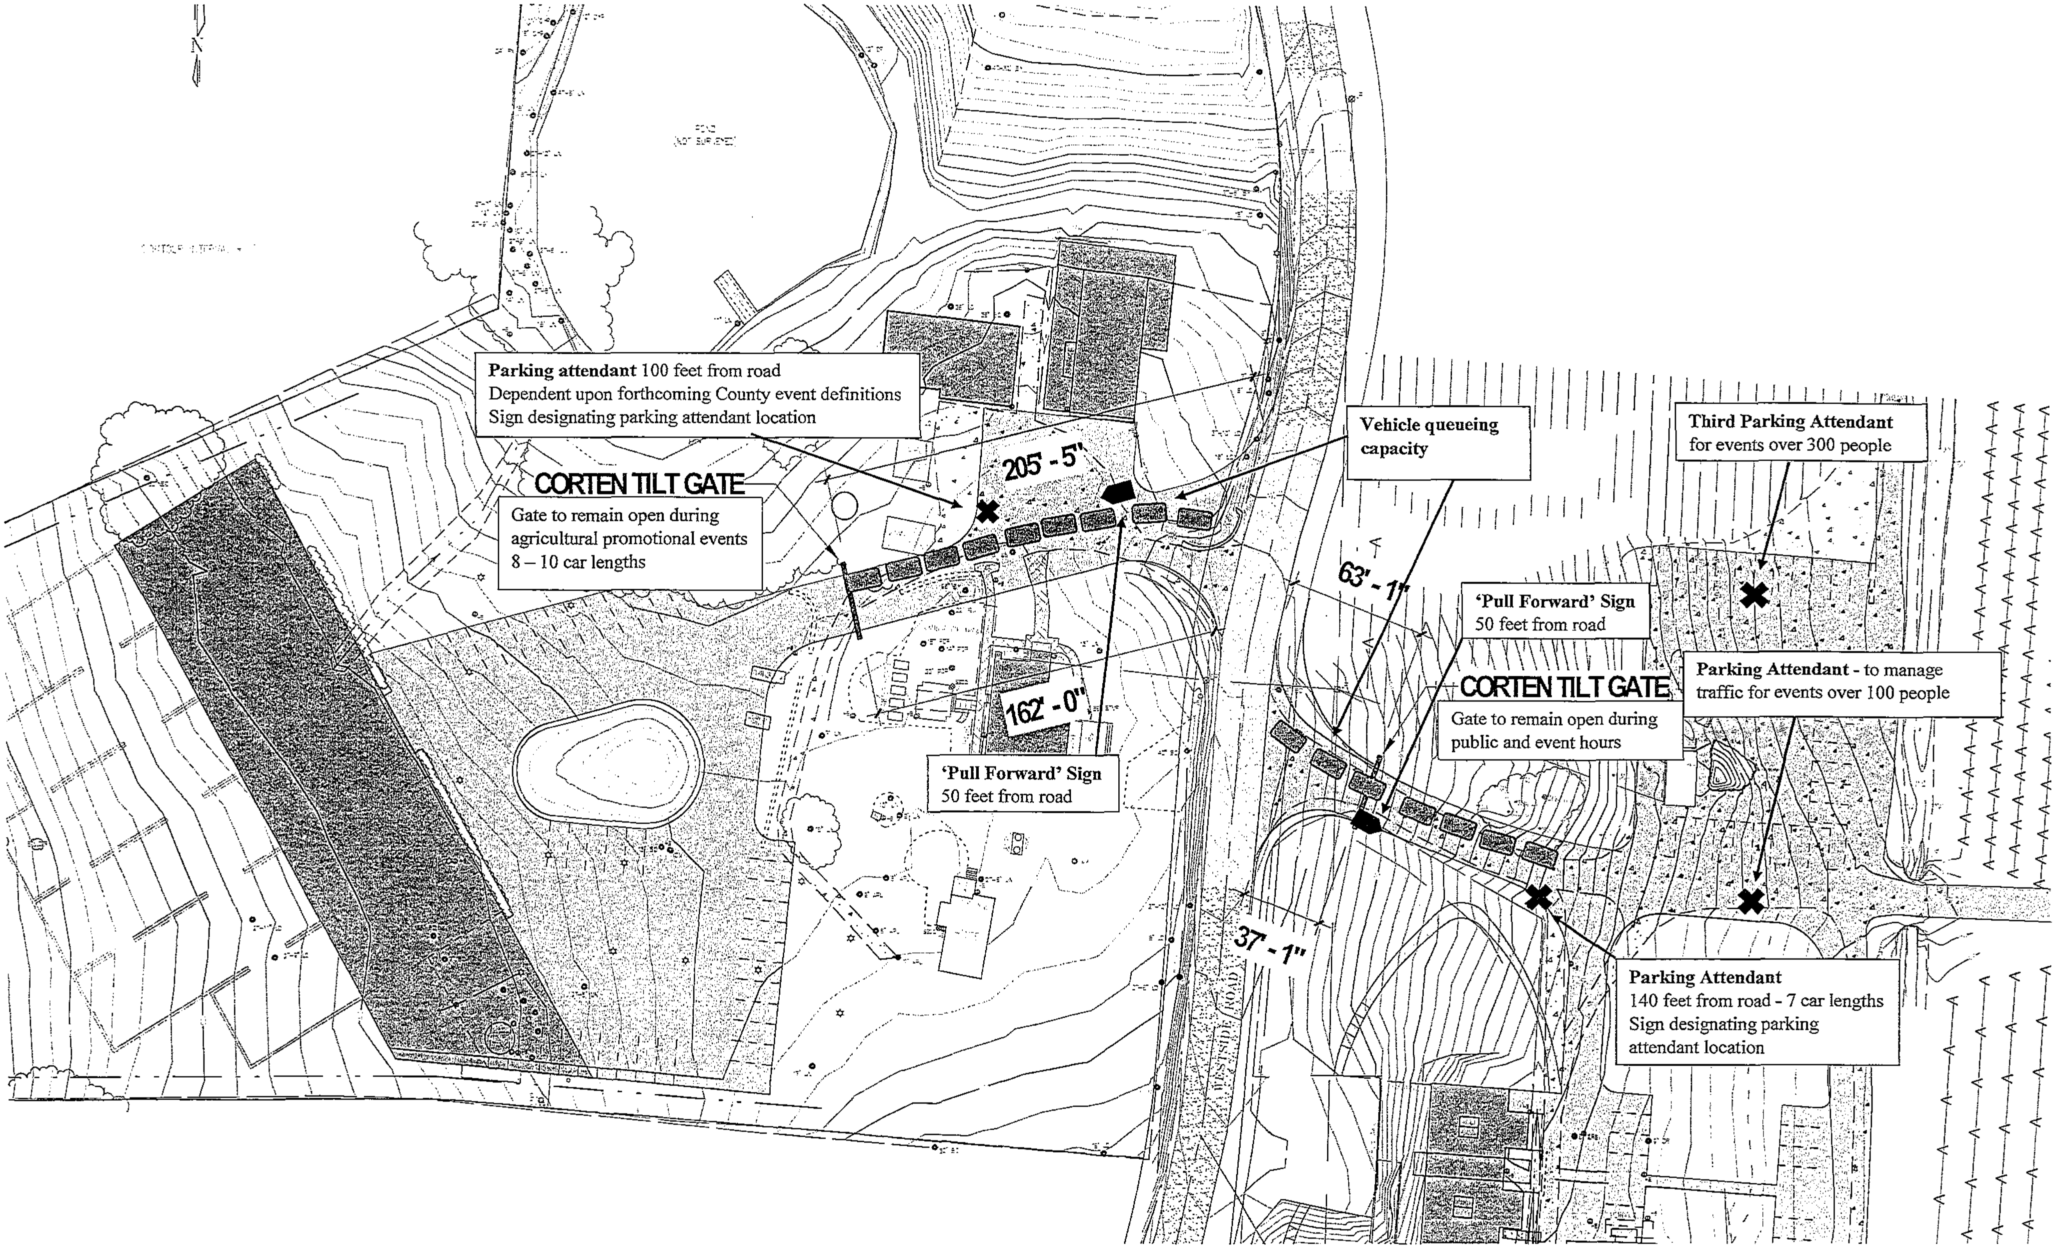
Typically have 3 or more axles

Super Heavy Trucks:

- 33,000 lbs+
- Requires escorts and special permits for Highway use
- Usually for Off Highway vocations like logging, mining, etc.



Traffic Queing Plan for West/East Driveways
dated 8-2017
UPE14-0008 Ramey Winery



Parking attendant 100 feet from road
Dependent upon forthcoming County event definitions
Sign designating parking attendant location

CORTEN TILT GATE
Gate to remain open during
agricultural promotional events
8 – 10 car lengths

Vehicle queueing capacity

'Pull Forward' Sign
50 feet from road

Third Parking Attendant
for events over 300 people

'Pull Forward' Sign
50 feet from road

CORTEN TILT GATE
Gate to remain open during
public and event hours

Parking Attendant - to manage
traffic for events over 100 people

Parking Attendant
140 feet from road - 7 car lengths
Sign designating parking
attendant location

Project Information

PROJECT SITE: 7097 WESTSIDE ROAD, HEALDSBURG, CA 95448

SCOPE OF WORK:
- ENLARGE EXISTING DRIVEWAYS TO MEET FSS STANDARDS
- PROVIDE ADDITIONAL DRIVEWAYS AND PARKING AREAS TO MEET NEW NEEDS
- RE-PURPOSE EXISTING (DILAPIDATED) HOP KILN INTO A TASTING ROOM
- RE-PURPOSE EXISTING (DILAPIDATED) BALING BARN INTO A MARKETING CENTER
- CONSTRUCT NEW WINERY & WINE CAVES AT THE REAR OF PARCEL 110-240-040

PARCEL NUMBER: 110-240-031 (a) & 110-240-040 (b)

ZONING & LAND USE: (a) LIA B6 60 BR, F1, F2, SR VCH / LIA 60
(b) LIA B6 60 SR / LIA 100

SETBACKS: REAR 20 ft
SIDE 10 ft

FLOOR AREA	EXISTING / RE-USED		NEW / PROPOSED	
	Conditioned	Unconditioned	Conditioned	Unconditioned
WINERY			9,210 sf	23,000 sf
WINE CAVES				20,720 sf
TASTING / HOP KILN	1,460 sf	5,390 sf		
TASTING / BALING BARN	3,940 sf	1,350 sf		
PUMP STATION		350 sf		
SUB-TOTAL	5,400 sf	7,090 sf	9,210 sf	43,720 sf

PROJECT TOTAL 14,600 sf (Conditioned Space)
50,810 sf (Unconditioned Space, incl'd Wine Caves)

Sonoma County Board of Supervisors

Public Hearing

UPE14-0008 Ramey Winery Appeal

December 11, 2018

Traci Tesconi, Project Planner/Project Review Manager

Requested Board Actions

- Consider Appeal
- Conduct Public Hearing
- Consider Written and Oral Comments
- Consider Board of Zoning Adjustments Approval of the Project with Modifications
- Consider Revised-Recirculated Mitigated Negative Declaration prepared for Project

Project Location

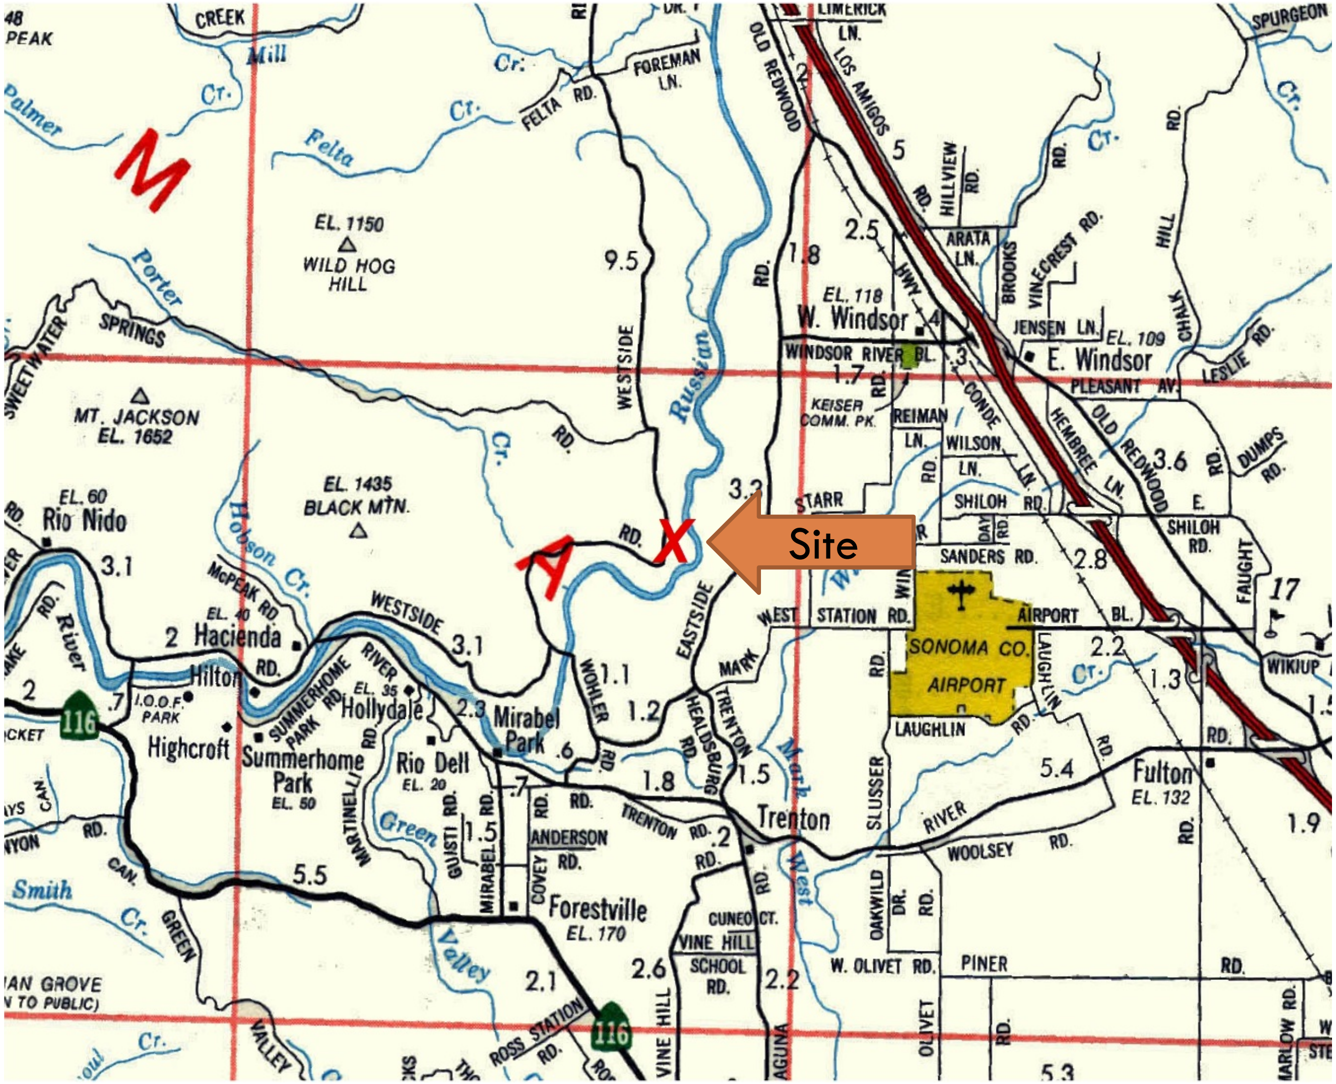
Project Site:
7097 Westside Rd, Healdsburg.

75 acres

Russian River Appellation

Referrals to Westside Community Assoc. and WASA.

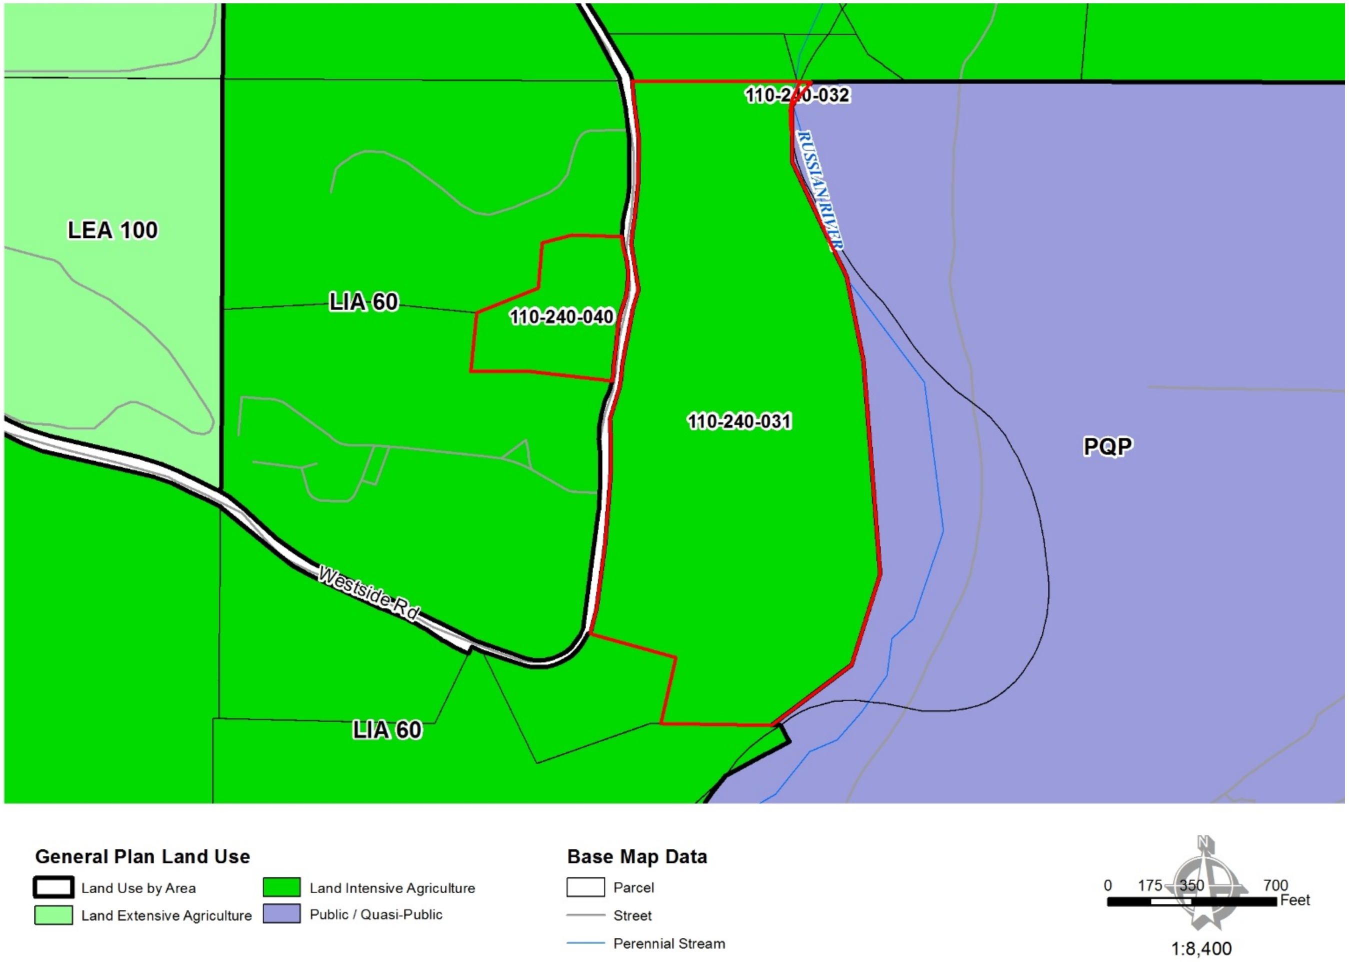
Outside of the Dry Creek Valley Citizens Advisory Referral Area



General Plan Land Use Map

Land Intensive Agriculture

60 acres per dwelling unit designation



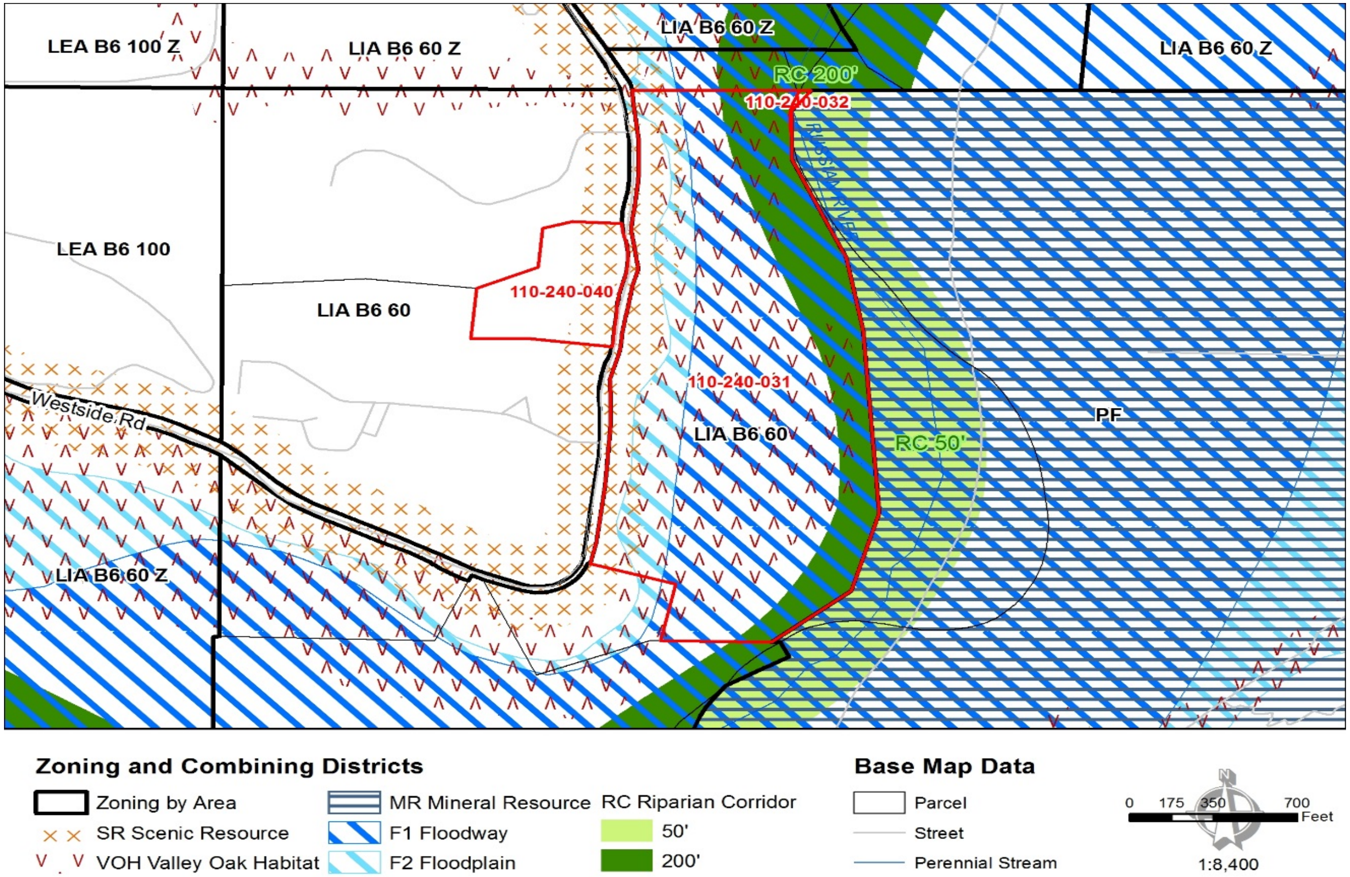
Numbers on map indicate maximum density in Acres/Unit, except Urban Residential where numbers indicate Units/Acres.

Zoning Map

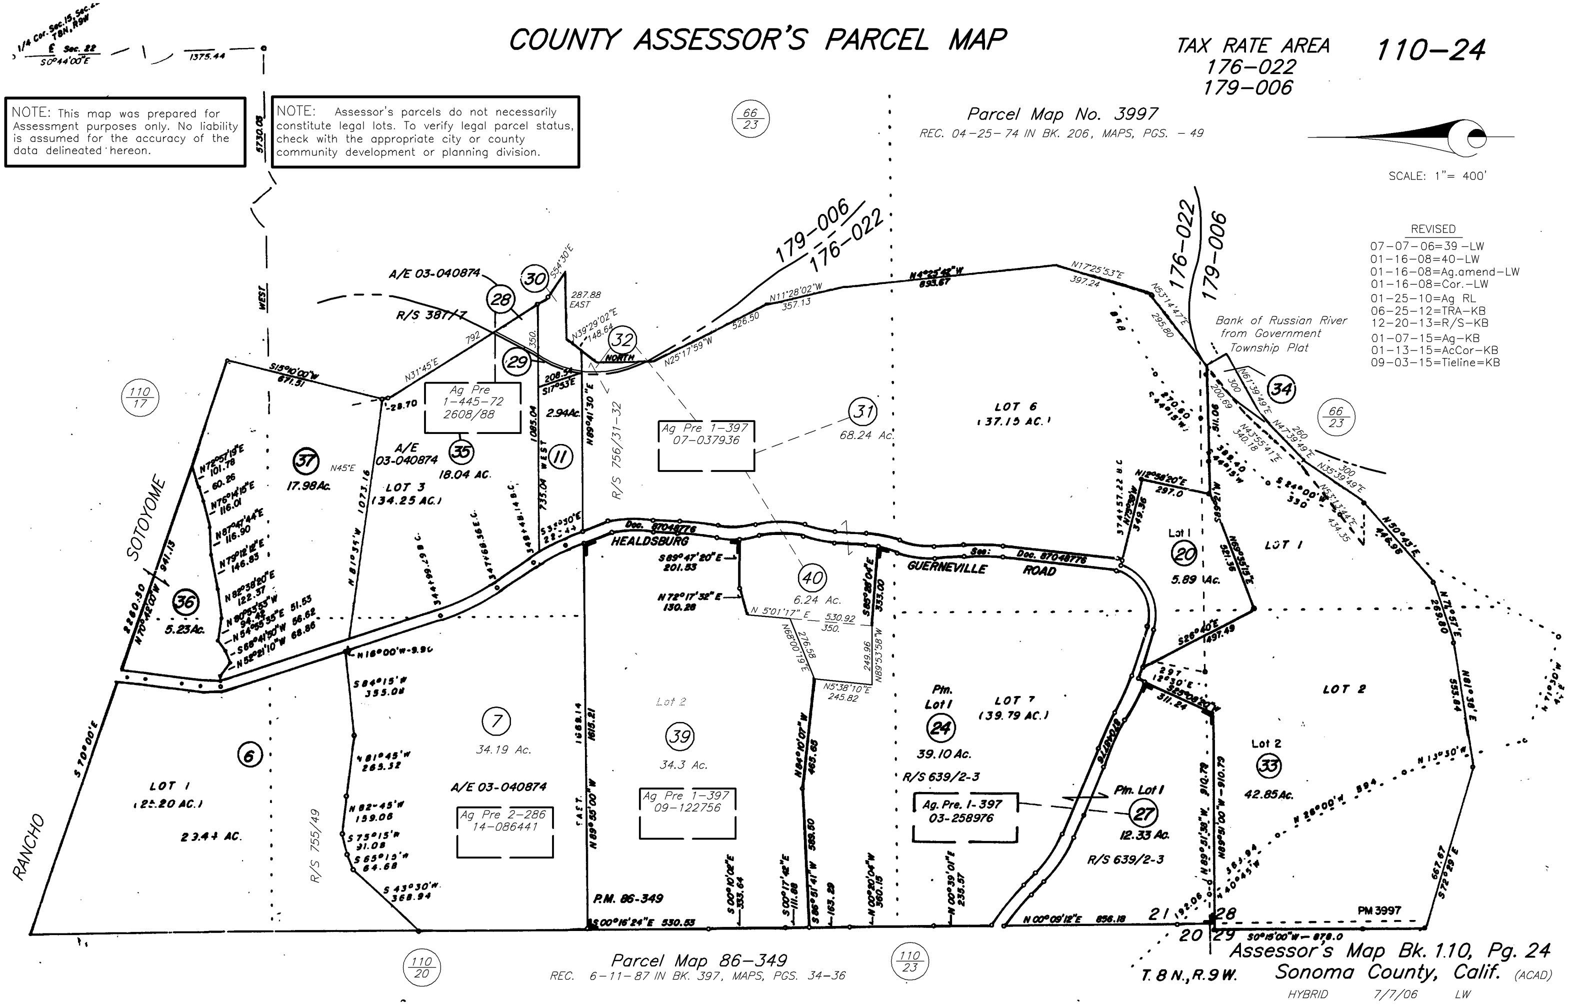
LIA B6 60 acre density, SR (Scenic Resource) (west side)/LIA B6 60 acre density, SR, F2 , F1, VOH, RC 200/100 (east side)

East side - Tasting Rooms, septic areas, & parking areas are all located outside of the F1 zone.

Scenic Corridor. Not Scenic Landscape Unit designation



One Legal Parcel formed by approved Lot Line Adjustment in 2004 (LLA04-0088)



COUNTY ASSESSOR'S PARCEL MAP

Project Site Plan Footpring Analysis

A1.00b

Winery Site Plan- West side

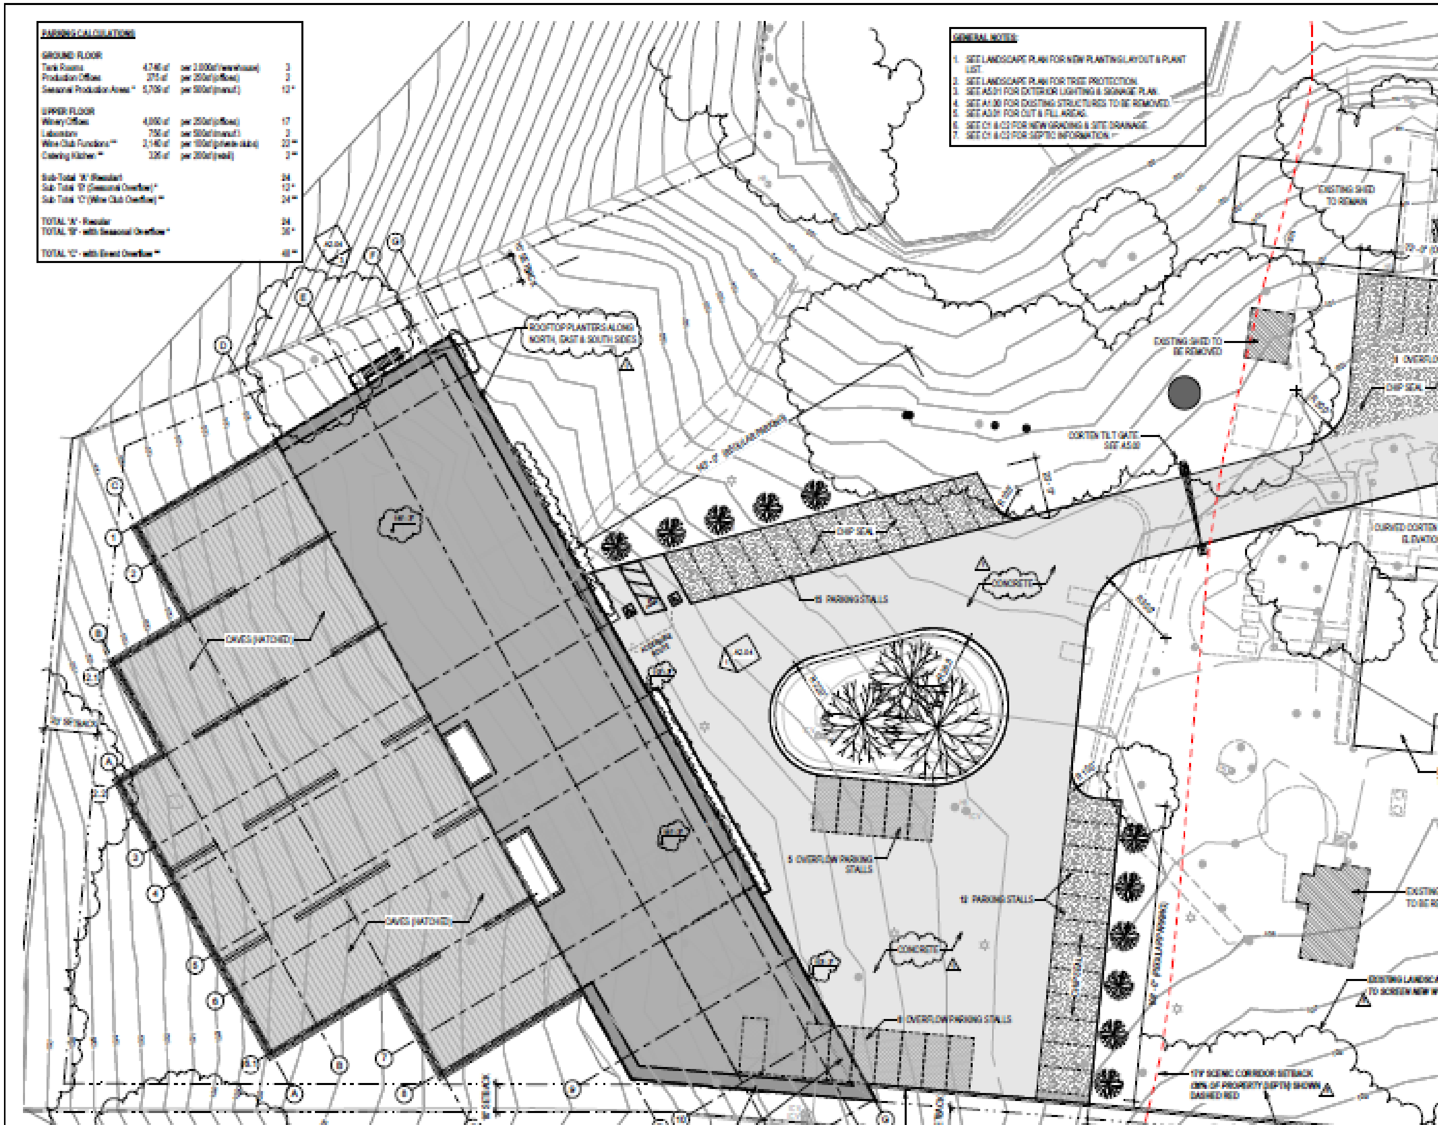
Winery Blding: Two story, 32,210 sf, for 60,000 case production.

Wine Cave 20,702 sf for long term aging. Both outside of Scenic Corridor setback

Limited to 30-guest ag. promotional events and no industry wide events. On-site parking with 25 standard, 2 accessible, and 21 over-flow spaces.

Retaining wall and fence 6-feet in height along southerly property line to meet General Plan Noise standards

On-site vineyard = 250 tons = 15,500 cases. 720 tons imported



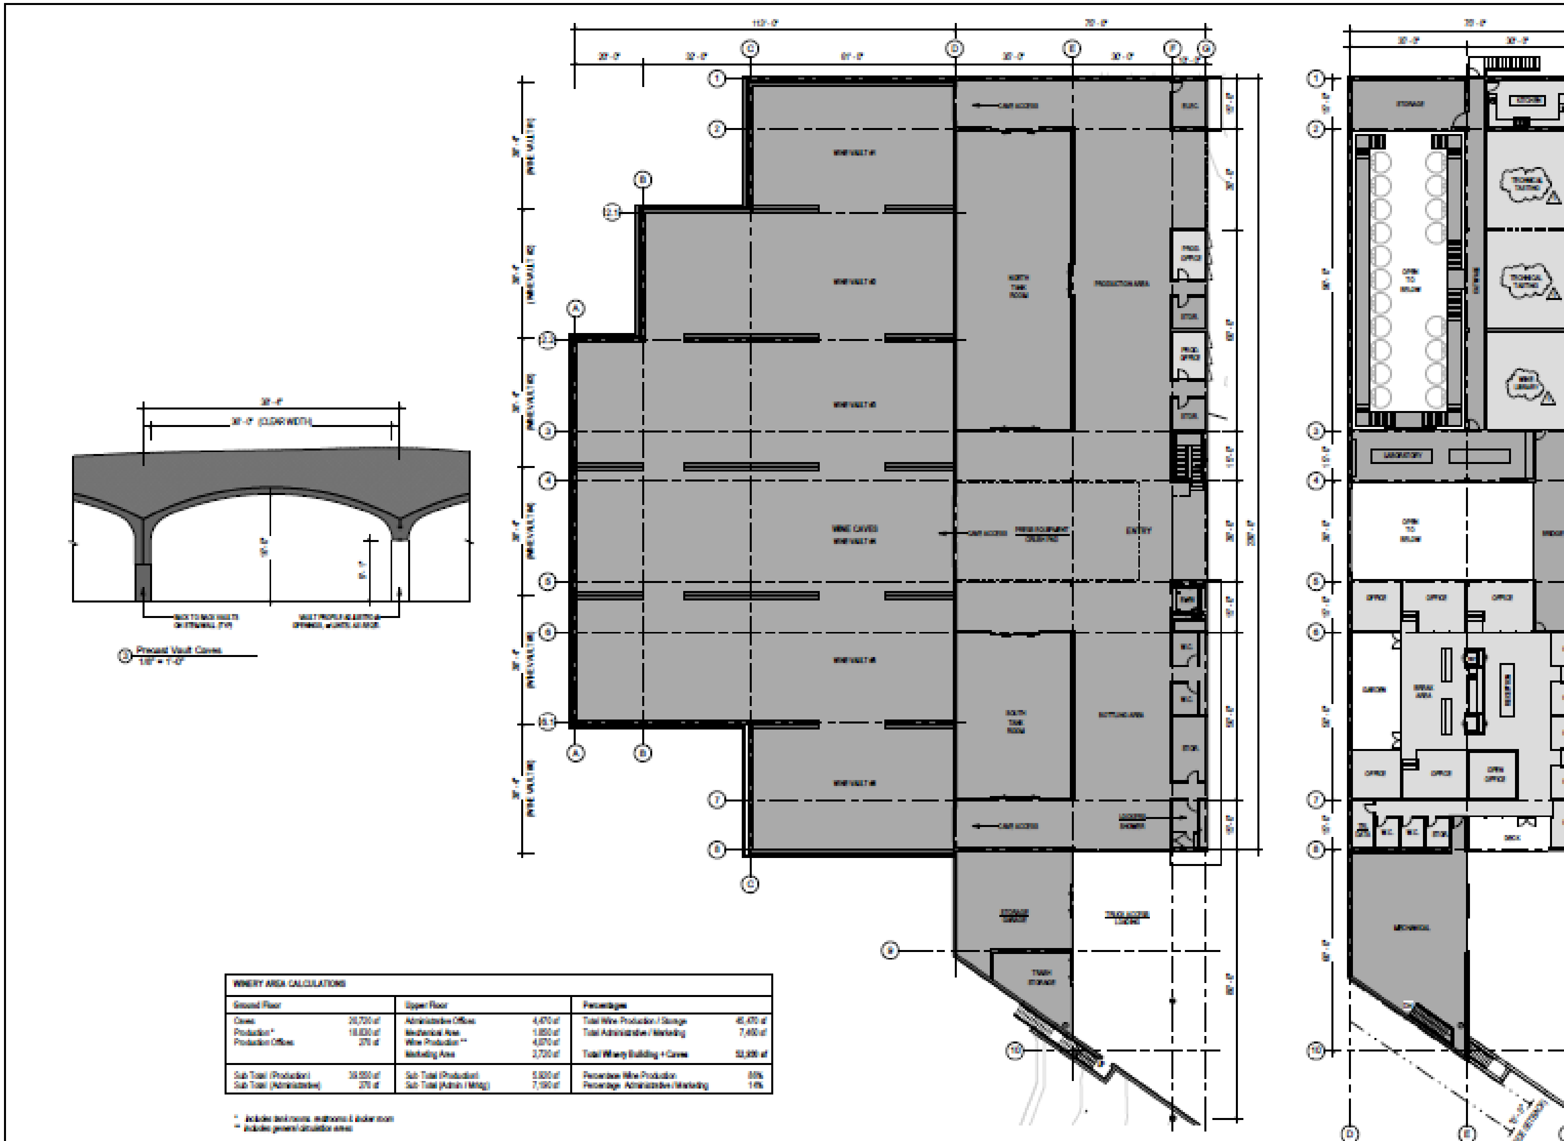
Winery Floor Plan

Includes:

All indoor crushing, processing, bottling, aging, and storing.

12 offices, a break room, locker rooms, a wine library, a commercial kitchen, and two technical tasting rooms for marketing staff, distributors, chefs, and ag promo events.

Adm/Office area = 14% of



Winery Building Elevations

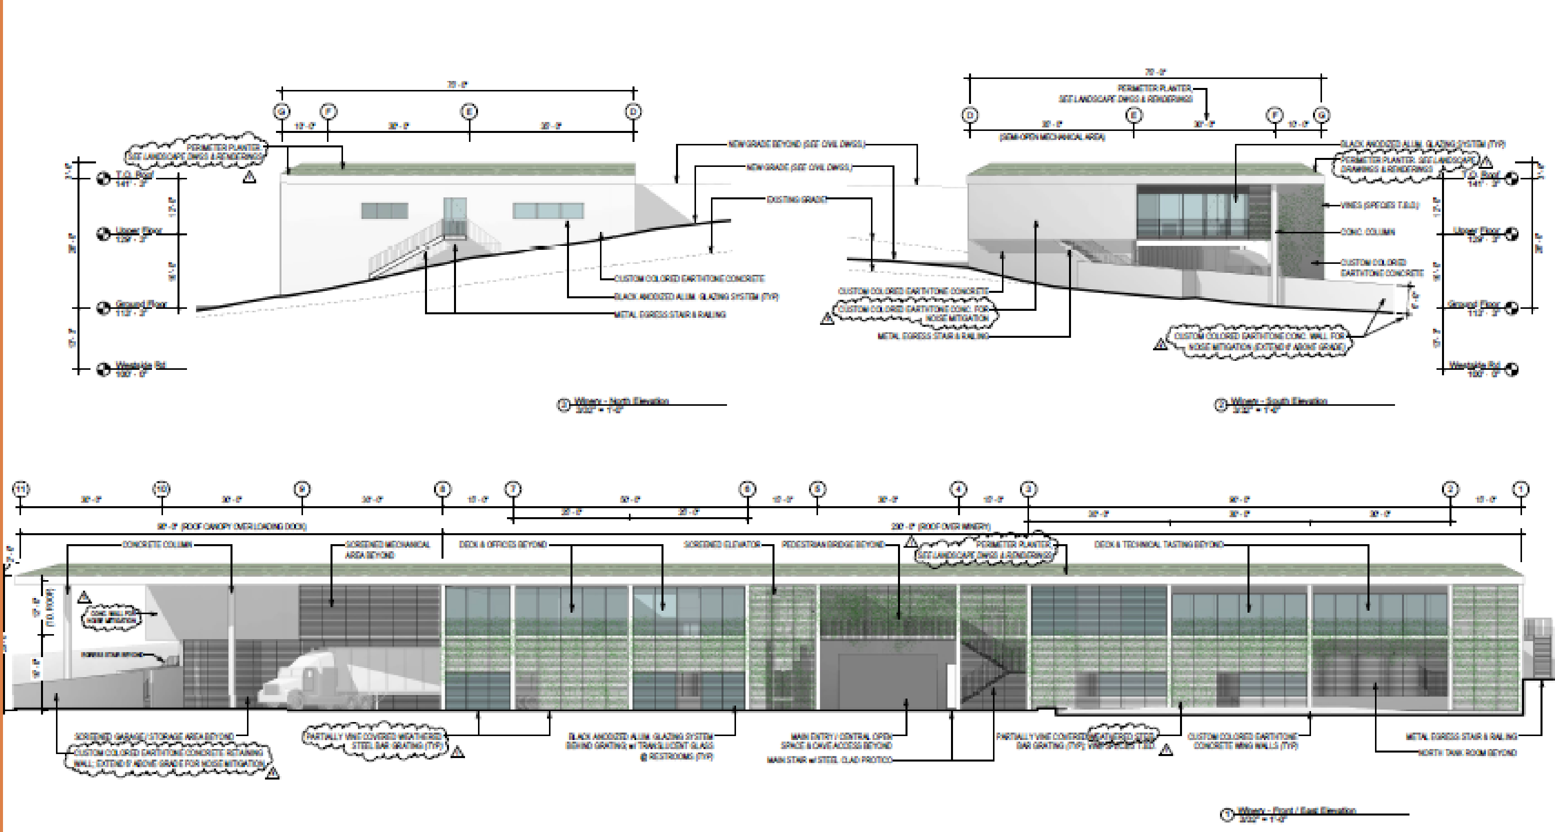
Winery Building 29 feet in height

Nestled into hillside with a perimeter planters along the roof-edge and vines planted along sides of building.

Solar panels on original plans. DRC concerned they not be too visible

Exterior lighting is downcast and fully shielded

New landscaping with native trees and shrubs



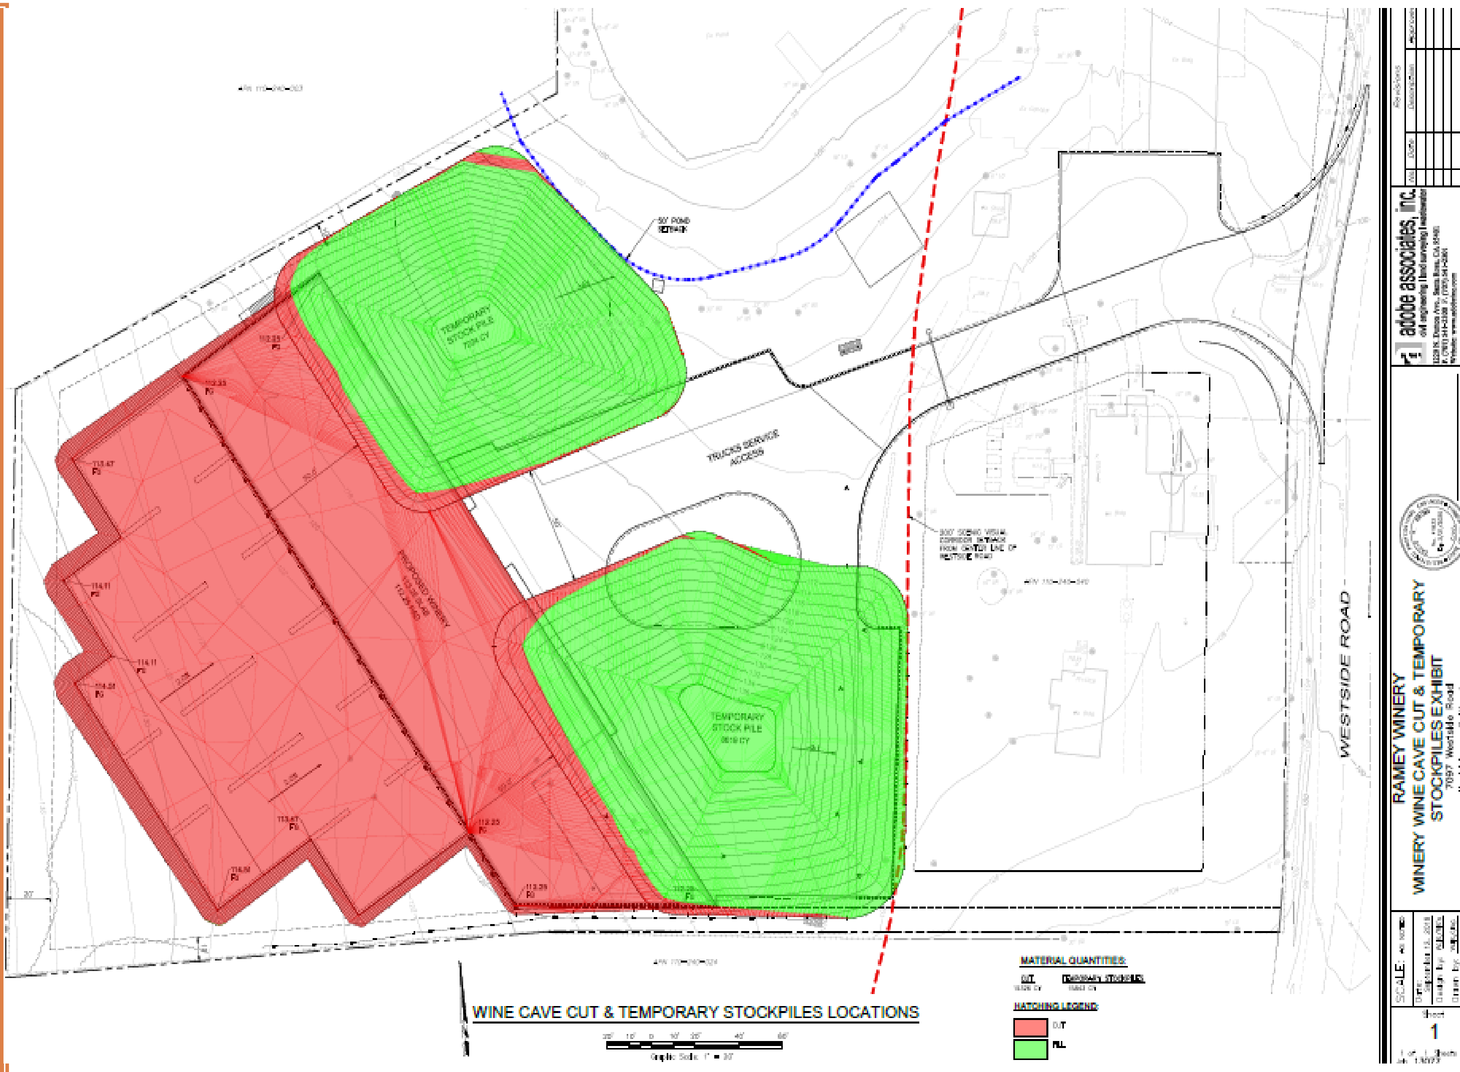
Wine Cave and Temporary Stockpiles of Cave Spoils

Approx. 20,720 sq. ft. in size and used for long-term aging of wine in barrels. Constructed of cut-and- cover excavation. With majority of spoils used to cover cave.

Class II –not open to the general public.

Estimated @ 6,300 cubic yards of cave spoils temp. stockpiled – later used for fill for winery, driveway, & landscaping.

Outside of Scenic Corridor Setback



Tasting Rooms Site Plan

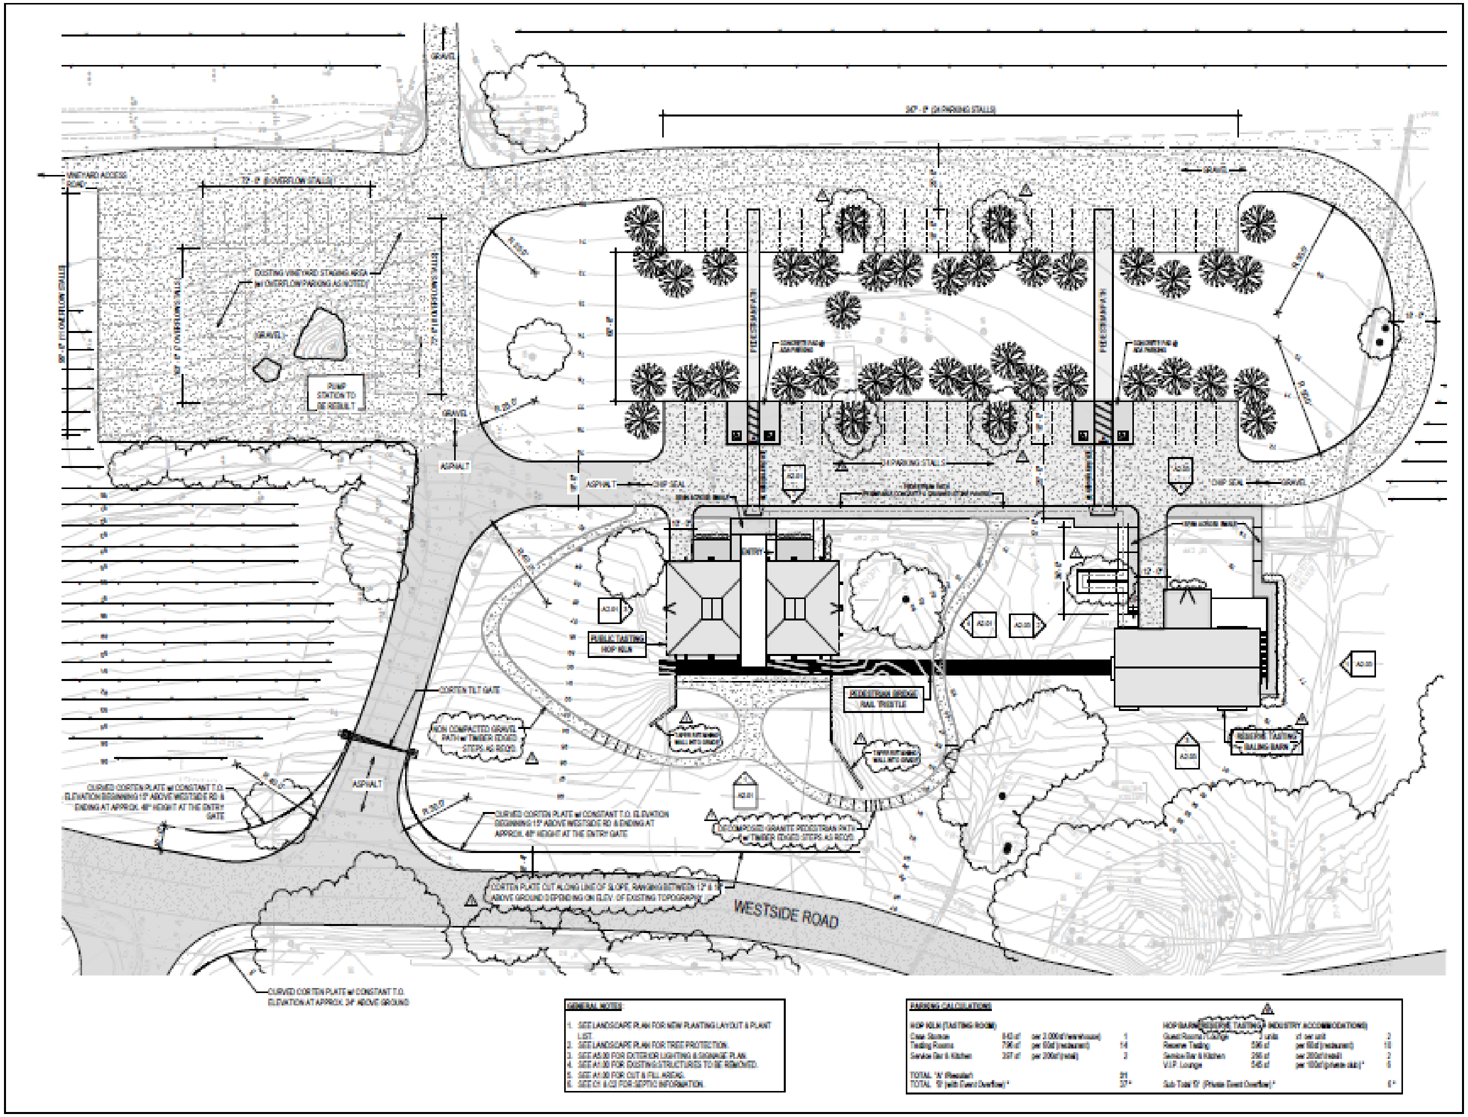
Restore/convert hop kiln to public tasting room & hop bale barn to reserve tasting room with 2 guest room marketing accommodation on the upper floor.

Existing driveway used

On-site Parking with 20 standard, 4 accessible, and 47 overflow spaces.

New landscaping

On-site wells and septic system.

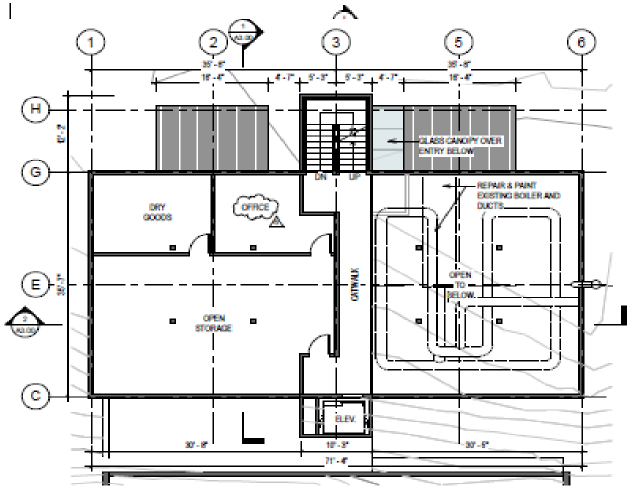


Public Tasting Room Floor Plan

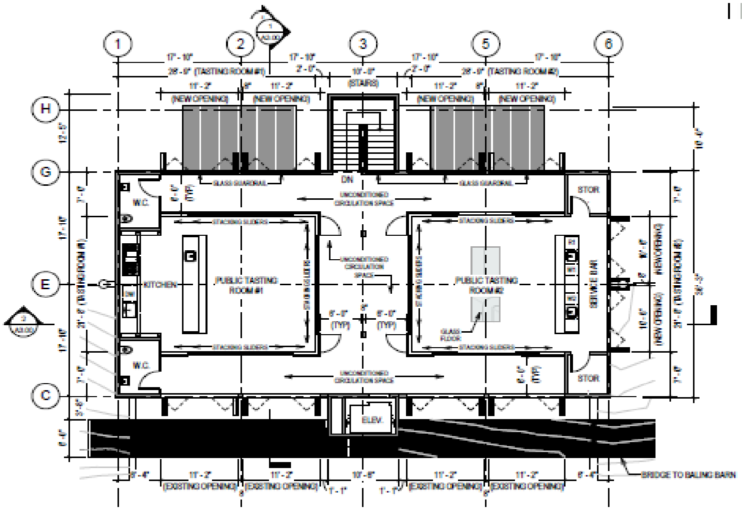
Includes:

One wine bar for tastings, a commercial kitchen, a food and wine pairing area, public restrooms, case good storage, and general storage.

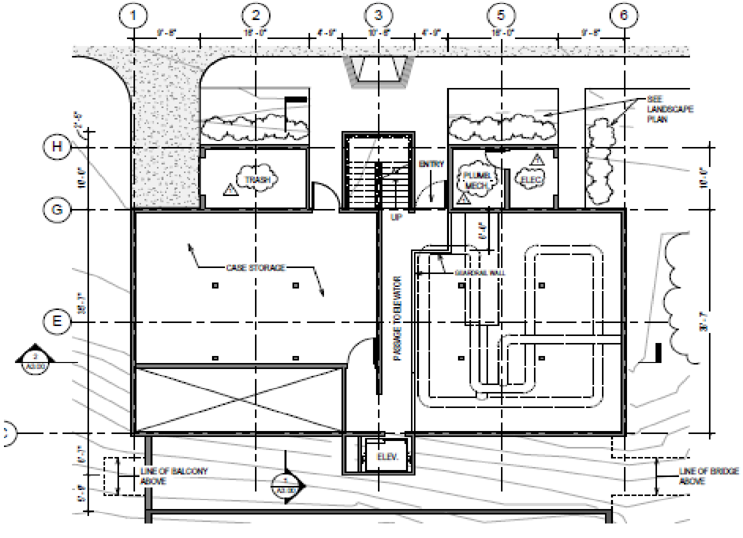
Exterior lighting is downcast and fully shielded



① Public Tasting / Hop Kiln - Mezzanine (Proposed)
1/8" = 1'-0"



② Public Tasting / Hop Kiln - 2nd Floor (Proposed)
1/8" = 1'-0"



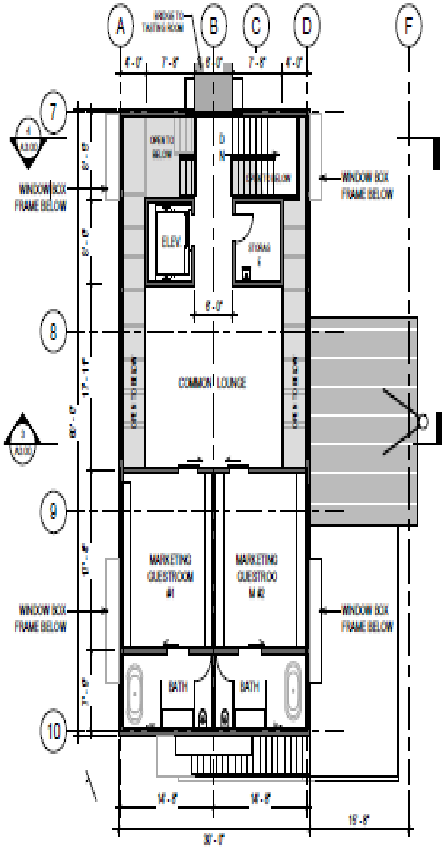
① Public Tasting / Hop Kiln - 1st Floor (Proposed)
1/8" = 1'-0"

Reserve Tasting Room Floor Plan with Two-Guest-Room Marketing Accommodation Units

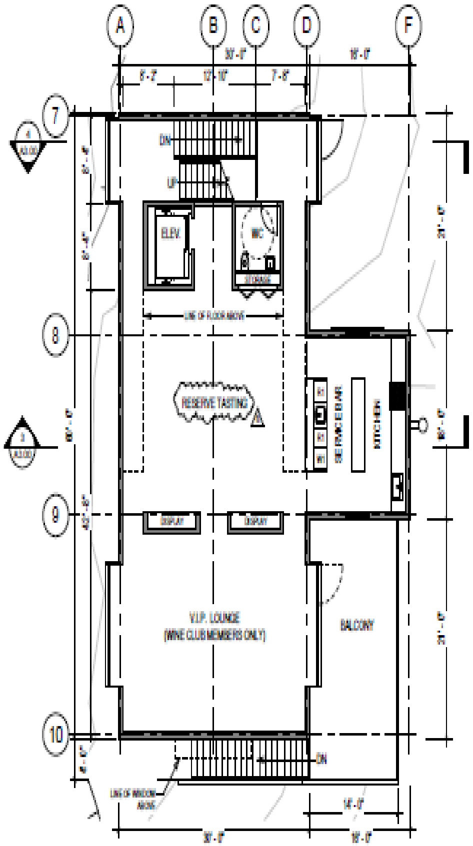
Includes:

One wine bar, tasting area, a commercial kitchen with food and wine, public restrooms.

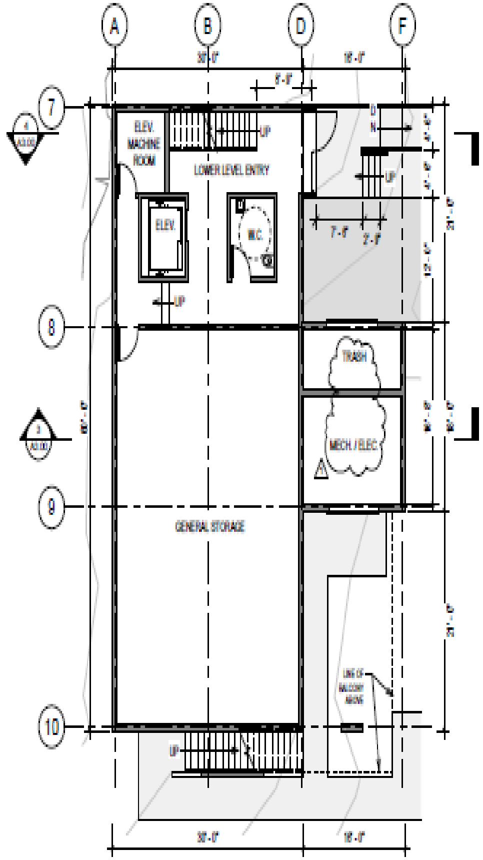
Upper Floor includes two guest-room marketing accommodations with two full bathrooms, lounge areas, elevator, and general storage area.



3 Reserve Tasting Baling Barn - 3rd Floor
1/8" = 1'-0"



2 Reserve Tasting Baling Barn - 2nd Floor
1/8" = 1'-0"



1 Reserve Tasting Baling Barn - 1st Floor
1/8" = 1'-0"

BZA Approved 20 Ag Promotional Events and 2 Industry Wide events

Event Type	No. of Events per Year	Hours	Maximum number of guests	Event Location on the property
Industry-wide Event	2 event days per year	10 am - 5 pm (*)	300	Tasting rooms, or outdoor walnut grove (East side)
Wine tastings	5	9 am - 9 pm	120	Tasting rooms, or outdoor walnut grove (East side)
Wine tastings	5	11 am - 3 pm; or 6 pm - 9 pm	60	Tasting rooms, or outdoor walnut grove (East side)
Winemaker lunches or dinners with on-site food preparation, and food and wine pairings	10	11 am - 3 pm; or 6 pm - 9 pm	30	Baling barn, outdoor walnut grove, or winery (East and West side)

(*) Industry wide events must occur during the public tasting room hours.
BZA eliminated two larger Ag Promo Events with 300 guests

Appellants' Contend (in summary)

- The Project generates significant employee, public, and truck traffic in an area with inadequate sight lines.
- The large scale project with tasting rooms on both sides of the road, approximately 1,000 feet radius of three existing tasting rooms is detrimental to the rural character of the area.
- The project is inconsistent with the intent of the General Plans to preserve agriculture and rural character under General Plan Policy AR-6f.
- The concentration of existing wineries on Westside Road and other County roadways is a public safety concern & county-wide issue.
- There's a risk of stand-alone tasting rooms. The focus on hospitality, promotional uses, marketing accommodations are all inconsistent with the Williamson Act contract and the County's Uniform Rules.
- The wine cave needs a feasibility study and further geological evaluation.
- The noise assessments are inadequate and noise impacts are not fully mitigated.
- The biological assessments are outdated and field surveys are needed.

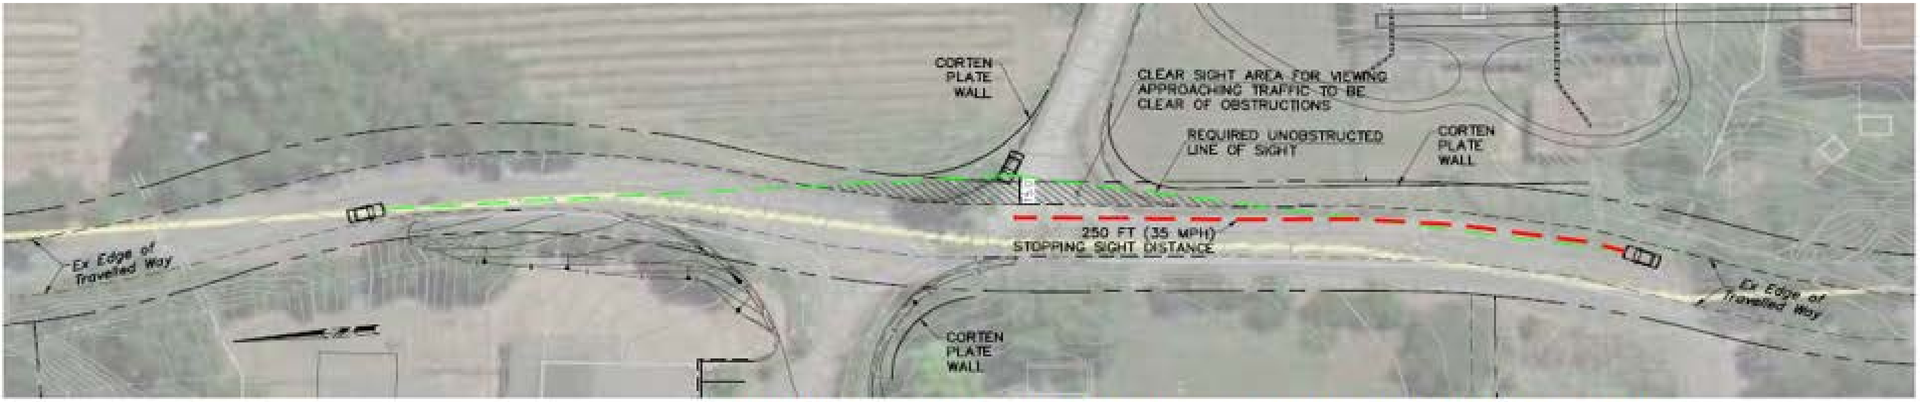
Issue 1: Project has Significant Traffic Generation and Inadequate Sight Lines

- Traffic Impact Study by W-Trans accepted by DPTW
- The largest 300-person event requires 14 staff. Using ratio of 2.5 guests per vehicle and solo occupancy for staff, such an event generates 268 trip ends- 134 inbound trips at the start and 134 outbound trips at the end. Trips would be spread out, with no more than 60 trips in either direction during a single hour, with staff arriving before and departing after guests.
- A further W-Trans addendum letter from 2017, explains that with these improvements to increase sight lines to the north to at least 250 feet, sight lines will be adequate to allow safe operation of the driveway.
- In response to the Alta Planning letter's which raised concerns with the speed study analysis, Public Works responded they are satisfied and accepted the W-Trans speed study methodology and the stopping sight distance analysis completed for the project.
- The Board of Zoning Adjustments reviewed all the traffic information and approved the project, but eliminated the two larger Ag Promo events.

Traffic

- W-Trans studies were accepted by the Department of Transportation and Public Works.
- Westside Rd is expected to have acceptable operations with project traffic
- Sight distance can be met at tasting room driveway
- With improvements to grade and lower the berm and remove trees on winery driveway, sight distance can be met
- On the winery side agricultural promotional events will be limited to 30 guest (12 vehicles) and no industry wide events.
- Conditions of Approval require events coordination with adjacent wineries and avoid having events at the winery during large bike events. (Cond No. 112)
- Collisions below state average. Two collisions reported from 2012-2016
- Pedestrian traffic will be restricted by winery management and entry gate at winery stating “Not Open to the Public”
- Traffic Control and Parking Management Plan required
- One year review of event activities

Stopping Sight Distance of 250 feet Met for Road Segment's 35 mph Speed Study results



STOPPING SIGHT DISTANCE - TASTING ROOM ENTRANCE

UPE14-0008 Ramey Winery

Issue 2: Project is detrimental to the Rural Character of the Area

The appeal contends the large project with tasting rooms on both sides of the road, and approximately 1,000 feet from three existing tasting rooms is detrimental to the rural character of the area.

- The County does not have a limit to the number of tasting rooms allowed on a site or along a roadway. Applicant will coordinate events with adjacent wineries and avoid scheduling events during large bike events (COA 112)
- W-Trans prepared a *sensitivity analysis*, it determined that 208 vehicle trips could be added in each direction on Westside Road before the northbound direction would experience unacceptable LOS D operations.
- The BZA determined the Project would not be detrimental to the rural character of the area. No joint road access conflicts have been identified, project traffic will not exceed General Plan objectives for levels of service on a site-specific or cumulative basis. The use of the on-site wells would not affect neighboring wells or the Russian River. The new winery building and cave are setback outside of the Scenic Corridor.
- The focal point of the project is the restoration and reuse of two historic hop kiln buildings on a large 75-acre parcel used for generations for farming activities.

Adjacent Wineries and Tasting Rooms within one-half mile

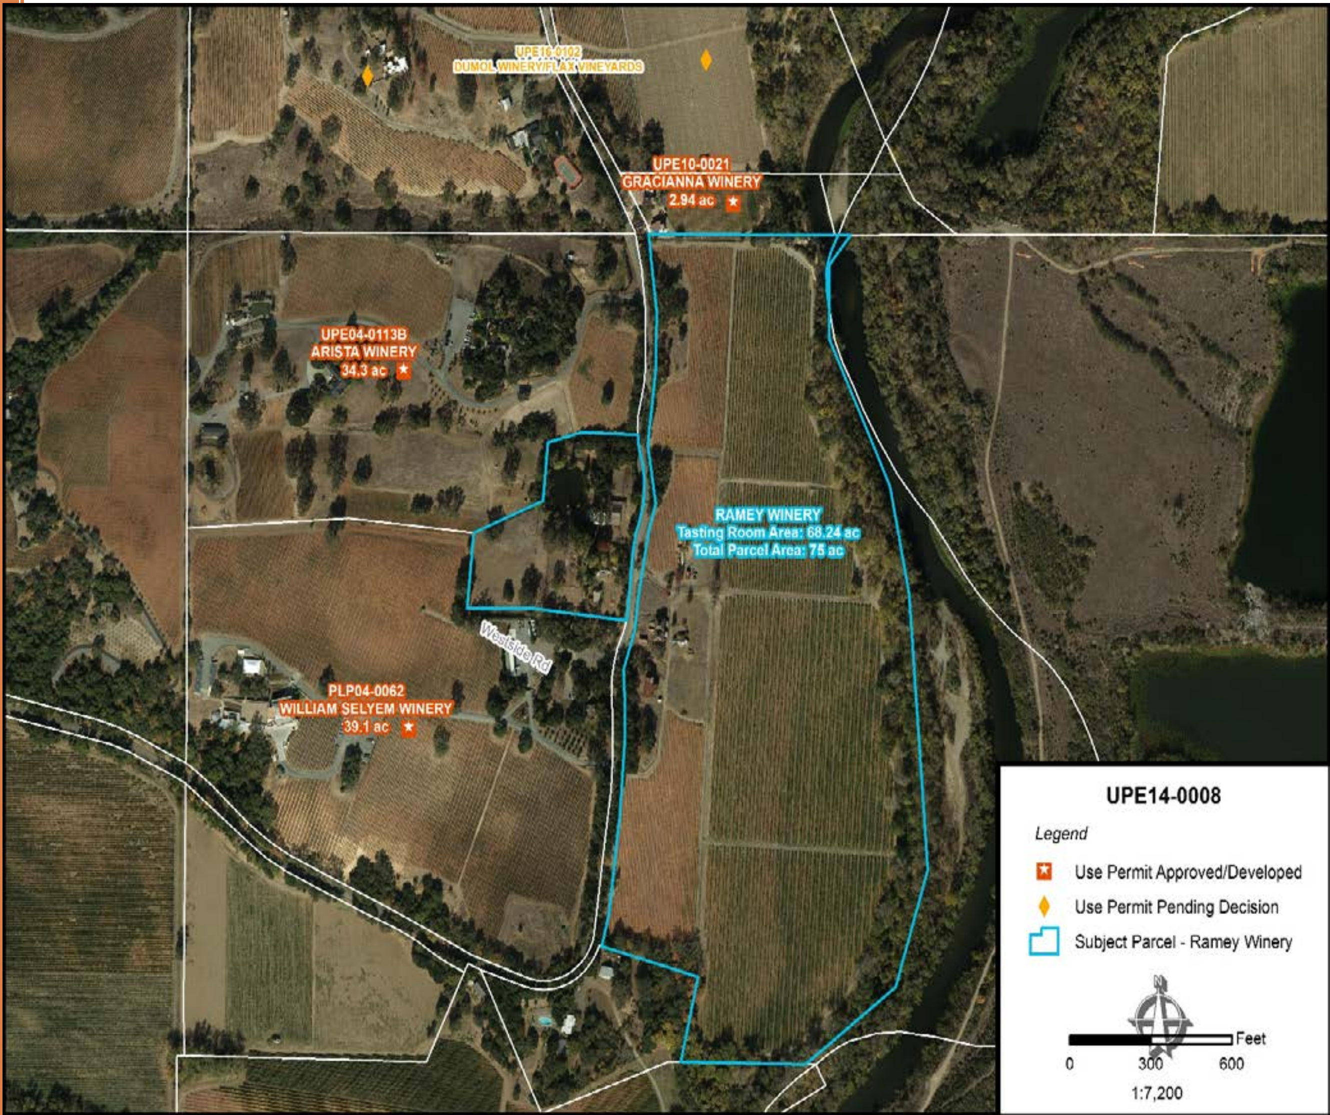
Allen Family Vineyards	6575 Westside Rd APN: 110-240-006	10/2004	16,000 cases	**No tasting**	**No events**

BZA Determined Project is Consistent with General Policy AR-5g

Traffic: Study explains LOS would not be exceeded and with mitigation traffic conflicts will be reduced.

Water: Hydrology report concludes projects' water use would not impact local groundwater or surface water, or effect neighbors' wells. Peer reviewed by PRMD Geologist.

Detrimental to Rural Character- Restore existing historic buildings. Winery/wine cave outside of the scenic corridor. Large parcel sizes. Event coordination with adjacent wineries. New winery building and wine cave located outside Scenic Corridor. No vines removed for any of the project's components.



Issue 3: Williamson Act and General Plan Polices to Preserve of the Area

The appeal contends the disproportionate focus on hospitality and promotional uses is inconsistent with the Williamson Act contract and intent of the General Plan to preserve agriculture and rural character.

- 75 acre site planted with 42 acres of vineyard with over 50% of the parcel planted in vineyard and total compatible use area is below the 5-acre threshold. No vines would be removed to accommodate the project.
- Uniform Rules allow promotion or sale of an ag product produced on site as a compatible use.
- BZA found the project is consistent with the State's Principles of Compatibility findings because the use is related to ag and will not displace or impair contracted lands in the area.
- No event will last more than two days
- No permanent structures used for just events
- Uniform Rules allow Marketing Accommodations allowed under Rule 8.3 B-2. A condition prohibits future conversions to other lodging uses such as a vacation rental. Prior approvals for marketing accommodations on several parcels in the County also under contract.
- Overall, the BZA found project consistent with the Land Conservation Act/Uniform Rules.

Ag Resource Policies and Zoning Code

- The proposed winery is consistent with LIA zoning and several AR Policies. Specifically, ***Policy AR-4a***: which states the primary use in Ag zones shall be ag production, related processing, and visitor serving uses.
- The proposed tasting room, agricultural promotional events, industry wide events, and food and wine pairing uses are consistent with the LIA zoning that allow for the sale and promotion of a local ag product.
- Consistent with AR Objectives 1.1. and 1.2 <u>to create and facilitate opportunities to promote and market all ag products grown or processed in So.</u> Co. And, Permit marketing of products grown or processed in So. Co. in all areas designated for agriculture use.
- The marketing accommodations are allowed in the LIA zoning and under the Williamson Act. Marketing accommodation units are not considered guest houses and are not considered single family residences as part of the density allowance. Under this project, marketing units are located within the tasting room and by design will not be used as a guest house or residence.

Joint Meetings with Sonoma County Landmarks and Design Review Committee Actions

Approve existing height of hop kiln at 45-feet hop and bale barn at 41-feet.

Approve maintaining the two hop structures in their current footprint within the Scenic Corridor setback.

Place HD Overlay Zone on East side.

Final review in a joint meeting with LC and DRC.

View from Westside Road Looking East - Existing Hop Kiln & Baling Barn

View from Westside Road looking East - Proposed Public Tasting Room with Barn Doors Open

Issue 4: Concentration of Wineries on Westside Road and in the County

The appellants contend there is an overwhelming concentration of existing wineries on Westside Rd and in the County. Its too great of a safety and county-wide issue for the Board to ignore.

- ❑ The County does not have a limit to the number of wineries allowed. The BZA approved the Project with Mitigations reducing overall impacts and found the Project will not be detrimental to the health, safety, comfort, and general welfare to the neighborhood.
- ❑ The traffic study was acceptable by Public Works which determined that collision rate for this road segment is below average.
- ❑ Conditions of approval require road frontage improvements on the project site, at the winery side driveway to the north, to increase sight lines to allow safe operations. Conditions require all parking be provided on site, and a Traffic and Parking Management Plan be implemented with Parking Attendants (Condition No. 110)
- ☐ Conditions of approval require event coordination with the two adjacent wineries and large bicycle events so winery's larger events are not held at the same time. (Cond 109)
- ☐ The use of amplified music or sound is permitted indoors in the tasting rooms during daytime hours with doors and windows closed. Outdoor events are only allowed to the rear of the site at the Picnic Grove. Amplified speech is limited to 78 dBA at 50 feet.

Project Studies and CEQA Document

- Cultural and Historic Studies
- Traffic Study
- Noise Study
- Greenhouse Gas analysis
- Water Balance analysis
- Wine Cave Feasibility Study
- Geological Report /Groundwater Availability study
- Habitat Assessment
- Revised- Recirculated Mitigated Negative Declaration was circulated for 30 days and sent to State Clearinghouse.
- Applicants have agreed to Mitigation Measures

Summary & Staff Recommendation

* Deny the Appeal and uphold the BZA's decision to approve the project with modifications.

* Project is consistent with General Plan Policies and the Zoning Code related to Ag uses.

* Two historic buildings will be restored and used.

* Sight distance improvements to the project site's entrance will provide safe operations of the project driveway and roadway.

*Limit event size at the winery site. Event Coordination will be done with neighboring wineries and large bike events.

* Mitigation Measures and Conditions have been incorporated into the project to avoid potential environmental impacts, and applicant agreed.

County of Sonoma Agenda Item Summary Report

Clerk of the Board
575 Administration Drive
Santa Rosa, CA 95403

Agenda Item Number: 74
(This Section for use by Clerk of the Board Only.)

To: County of Sonoma Board of Supervisors

Board Agenda Date: December 11, 2018

Vote Requirement: Majority

Department or Agency Name(s): Permit Sonoma

Staff Name and Phone Number:

Supervisorial District(s):

Title: Geologic Hazard Area Requirements for Rebuilds of Homes Destroyed in the 2017 Sonoma Complex Fires

Recommended Actions:

(1) Adopt the proposed amendment to add policy PS- 1P to the Public Safety Element of General Plan 2020; and

(2)Adopt the proposed ordinance exempting preexisting single family homes destroyed by the 2017 fires from the geologic report and fault setback requirements in the Geologic Hazard Area combining district.

Executive Summary:

In response to Board direction staff is advancing limited amendments to the Public Safety Element of Sonoma County General Plan and a county ordinance to reduce the geologic report and fault setback requirements for reconstruction of single-family homes destroyed in the October 2017 fires.

The proposed amendments would apply only to parcels in the, G, Geologic Hazard Area Combining District (Geologic Hazard Zone), that were affected by the Sonoma Complex Fires 2017. The amendments would be limited to reconstruction of previously existing one and two story single-family homes of wood or steel frame construction. The proposal is fully compliant with the state Alquist-Priolo Earthquake Fault Zoning Act, which exempts most single-family homes up to two stories. Homes being rebuilt under the proposal will still be required to comply with all other current codes, including seismic safety standards.

Discussion:

The October 2017 fires destroyed more than two thousand residences in unincorporated Sonoma County. Approximately 55 of the homes destroyed were within the Geologic Hazard Zone, primarily located in the low density residential communities of Mark West Springs, Larkfield, and Wikiup. The Sonoma County General Plan and County Code requires a geologic fault study (geologic report) prior to construction and a 50 foot minimum setback from a known fault in the Geologic Hazard Zone. The intent of the proposed General Plan amendment and ordinance is to reduce the additional studies and expenses faced by property owners trying to rebuild fire destroyed homes.

Project Description:
The proposed amendments include adding Policy PS-1P to the Sonoma County General Plan Public Safety Element and an uncodified ordinance to allow fire-destroyed homes in the Geologic Hazard Zone to be rebuilt without the otherwise required geologic study and fault trace setback. The proposed exception for fire rebuilds will not apply to development other than rebuilds on the same site of homes lost in the October 2017 fires.

The geologic report otherwise required under the General Plan Public Safety Element and Article 70 of the Sonoma County Zoning Ordinance is a fault study which entails deep trenching across each property, perpendicular to the suspected fault, to determine whether there is a surface trace of an active fault on the site. The trenching and geologic report could result in additional siting constraints, months of delay and added costs of up to $15,000. The proposed general plan amendment and ordinance would allow the approximately 55 property owners who lost homes in the Geologic Hazard Zone to rebuild their homes without incurring the significant additional delay and expense of trenching and preparation of a geologic report. The proposed amendment and ordinance were referred to the State Geologist and the California Board of Forestry. Our local tribal contacts were provided an invitation to consult on the General Plan Amendment and provided no comments.

Location:
The homes within the Geologic Hazard Zone that were destroyed in the October 2017 fires are concentrated in the Mark West Springs and Larkfield/Wikiup areas. Many of these homes were built before the County's Geologic Hazard Zone requirements were adopted in 1974 as part of the 1989 General Plan. These homes predated the current requirements and were built without geologic studies or fault setback requirements. A limited number of affected homes in the Geologic Hazard Zone were built later and already have geologic reports on file from their initial construction.

Seismic Safety:
Allowing rebuilding of destroyed homes on their same site without a geologic report does not increase the exposure of persons to earthquake hazards over pre-existing conditions. The homes that would be rebuilt under this legislation were constructed without geologic report because they were constructed prior to the current county policies and state seismic standards. The homes will be rebuilt to significantly increased seismic safety standards when compared with their original construction. Because the California building code seismic standards have been regularly amended and improved since most of the affected Geologic Hazard Zone homes were built, the rebuilt homes will have reduced earthquake vulnerability as compared to the previous construction. As noted above, the proposed legislation will not apply to any other projects. Rebuild projects would be required to comply with all current building codes including, seismic safety standards and geotechnical investigation (soils reports) requirements where required, and state law, including the Alquist-Priolo Act.

General Plan Consistency:
The General Plan 2020 policies related to the proposed project are shown below including the proposed new policy, **Policy PS 1-P**.

***Policy PS-1e:** Continue to implement the "Geologic Hazard Area" combining district which establishes regulations for permissible types of uses and their intensities and appropriate development standards.**

***Policy PS-1f:** Require and review geologic reports prior to decisions on any project which would subject property or persons to significant risks from the geologic hazards areas shown on Public Safety Element hazard maps and related file maps and source documents. Geologic reports shall describe the hazards and include mitigation measures to reduce risks to acceptable levels. Where appropriate, require an engineer's or geologist's certification that risks have been mitigated to an acceptable level and, if indicated, obtain indemnification or insurance from the engineer, geologist, or developer to minimize County exposure to liability.**

***Policy PS-1g**: Prohibit structures intended for human occupancy (or defined as a "project" in the Alquist-Priolo Special Studies Zones Act and related Administrative Code provisions) within 50 feet of the surface trace of any fault.**

> **Policy PS-1p:** Notwithstanding the foregoing, Policies PS-1f and PS-1g shall not apply to an application to reconstruct a single-family dwelling located in the Geologic Hazard Area Combining District that was destroyed in the October 2017 Sonoma Complex Fires, provided that the dwelling would comply with and qualify for an exemption under the state Alquist-Priolo Earthquake Fault Zoning Act (Public Resources Code, sec. 2621 et seq.), and provided further that the application complies with all applicable requirements of that certain ordinance adopted by the Board of Supervisors on December 11, 2018 and relating to reconstruction of single-family homes in the Geologic Hazard Area Combining District. This policy shall not be interpreted to apply to any project other than reconstruction of a single-family home destroyed in the 2017 Sonoma Complex Fires that is proposed to be rebuilt on the same lot.

*denotes mitigation policy in the General Plan

The proposed General Plan and ordinance amendments are very limited in scope, and apply to rebuilds of homes that existed when the General Plan was adopted. Accordingly, the proposed legislation is consistent with the General Plan as amended by the above text. As proposed Policy PS 1-P will only apply to rebuilding of previously existing homes destroyed by the October 2017 fires. This policy will not apply to other development.

The homes to be rebuilt under the proposed conditions generally predated the Geologic Hazard Zone and requirement for a geologic report and their reconstruction does not interfere with the continued implementation of the above policy and Geologic Hazard Area Combining District for new uses. The proposed ordinance requires the property owner to sign an indemnification and acknowledgement of risk acknowledging that the home is within the Geologic Hazard Zone and accepting the risk of rebuilding without the benefit of a geologic report.

Area Plan Consistency:

Some of the parcels that are designated with the Geologic Hazzard Area Combining District and impacted by the October 2017 Fires are within the boundaries of the. The Area Plans do not include the Mark West or Larkfield/Wikiup communities where most of the parcels impacted by this proposal are concentrated. The previously applicable Larkfield Area Plan was repealed in 2008. The proposed project is consistent with each of the area plans. Applicable policy from each Area Plan is below.

Bennet Valley Area Plan:
Residential development shall occur in the least constrained, most suitable areas. Parcels within the Alquist-Priolo Zone or in geologically unstable areas shall be developed only at very low densities. Siting and foundation design of all structures in these areas shall comply with the General Plan Public Safety Element.

The proposed project does not increase residential density or change allowed uses. The siting requirements are consistent with the General Plan Public Safety Element as amended by this proposal. Additionally, the concentration of properties where the exemption will be applied is outside of the Bennett Valley Area Plan.

Franz Valley Area Plan:
Limit or prevent residential development in areas of high or extreme fire, geologic, and seismic hazards.

The proposed project does not increase residential density or change allowed uses. The proposed project does not include new development, rather it will only be applied for the reconstruction of previously existing residential structures. Additionally, the concentration of properties where the exemption will be applied is outside of the Franz Valley Area Plan.

Sonoma Mountain Area Plan:
Geologic Hazards

> *(1) Continue to implement the Alquist-Priolo Special Studies Zones Act of 1972.*
> *(2) Require an engineering geologist's report whenever there is an unacceptable level of risk of geologic hazard associated with a proposed land development.*

The proposed project is consistent with provision of the Alquist-Priolo Act that exempts single family residential development of wood or steel frame construction up to two stories from the report and fault setback requirements. Because the proposed exception will be made only for previously developed residential structures no new land development is proposed, further the rebuilt homes will have reduced earthquake vulnerability as compared to the previous construction. No new risk to seismic hazards is proposed. Additionally, the concentration of properties where the exemption will be applied is outside of the Sonoma Mountain Area Plan.

Zoning Consistency:
The project is consistent with Zoning Code and implements the General Plan as amended by this proposal. The uncodified ordinance would not amend the text of the Sonoma County Zoning Code and is consistent with the purpose of Article 70, the Geologic Hazard Area Combining District in that it does not increase risk due to earthquake hazards because it will only allow for the rebuilding of previously existing homes without a geologic report or fault setback requirements.

Prior Board Actions:

September 18, 2018 the Board approved Resolution 18-390, directing Permit Sonoma to bring forward proposed amendments to the general plan and county code to clarify that single family homes located in the Geologic Hazard Zone and destroyed in the Sonoma Complex Fires may be rebuilt on the same parcel without meeting geologic report or fault setback requirements.

Strategic Plan Alignment Goal 1: Safe, Healthy, and Caring Community

The intent of the proposed amendment and ordinance is to reduce the obstacles faced by homeowners trying to rebuild. Reducing barriers to rebuilding is essential to the community's recovery. The homes to be rebuilt under this legislation will be rebuilt to meet significantly increased seismic safety standards when compared with their original construction.

☐ 4/5 Vote Required

Resolution Of The Board Of Supervisors Of The County Of Sonoma, State Of California, Adopting Amendments To The General Plan 2020 Public Safety Element To Allow Reconstruction Of Single Family Homes Destroyed In The 2017 Sonoma Complex Fires And Located in the Geologic Hazard Area Combining District Without Geologic Reports And Fault Setback Requirements.

Whereas, on September 18, 2018, the Sonoma County Board of Supervisors adopted Minute Order Resolution No. 18-0390, directing County staff to bring forward draft amendments to the General Plan and County ordinance to specify that single family homes located in the 'G' Geologic Hazard Area Combining District and destroyed in the October 2017 Sonoma Complex Fires may be rebuilt on the same parcel without geologic reports (the proposed amendments); and

Whereas, on November 15, 2018, the Planning Commission held a duly noticed public hearing on the proposed amendments, at which time all interested persons were given an opportunity to be heard. At the conclusion of the hearing, the Commission voted to recommend approval of the proposed General Plan text amendments and ordinance; and

Whereas, in accordance with applicable provisions of law, the Board of Supervisors held a duly noticed public hearing on December 11, 2018, at which time all interested persons were given an opportunity to hear and be heard regarding the proposed amendments; and

Whereas, the Board of Supervisors has reviewed and considered the information contained in the proposed General Plan text amendments and ordinance, together with all public comments, staff reports, and other materials prepared and submitted in connection with the proposed text amendments.

NOW, THEREFORE, BE IT RESOLVED that the Board of Supervisors makes the following findings and determinations with respect to the proposed General Plan text amendments:

Attachment A

1. The proposed General Plan text amendments and ordinance are within the scope of the Sonoma County General Plan 2020 EIR (Final EIR) and the Final EIR adequately describes the activity for purposes of the California Environmental Quality Act (CEQA). The Board hereby readopts and incorporates herein the CEQA findings made in adopting the FEIR. Pursuant to Public Resources Code section 21166 and California Code of Regulations, title 14 (CEQA Guidelines), sections 15168 and 15162, no additional environmental review is required. In the alternative, Board finds that the project is exempt from CEQA pursuant to the general rule of CEQA Guidelines section 15061(b)(3), which applies because it can be seen with certainty that there is no possibility that the proposed General Plan text amendments may have a significant effect on the environment.

2. The proposed General Plan text amendments will be internally consistent with the remainder of the General Plan as amended. Most of the destroyed single-family homes in the Geologic Hazard Area existed at the time General Plan 2020 was adopted, and predate the creation of prior General Plan policies and ordinances related to the Geologic Hazard Area. Most of these homes were originally sited and constructed without geologic reports or fault setbacks. The Public Safety Element, Land Use Element, and the entire General Plan assumed the existence of these pre-existing homes in the Geologic Hazard Area. Accordingly, reconstruction of these homes without prior submission of geologic reports and without fault trace setback does not interfere with the continued implementation of the General Plan Public Safety Element or any other element of the General Plan. Moreover, consistent with existing Public Safety Element Policy PS-1f, the proposed ordinance requires the property owner to sign an indemnity and acknowledgement of risk acknowledging that the home is within the Geologic Hazard Area and accepting the risk of rebuilding without the benefit of a geologic report.

3. The proposed General Plan text amendments are consistent with the applicable Area Plans, as follows:

a. The proposed text amendments and implementing ordinance are consistent with the Bennett Valley Area Plan in that the proposal does not increase residential density or change allowed uses. The siting requirements are consistent with the General Plan Public Safety Element as amended.

b. The proposed text amendments and implementing ordinance are consistent with the Franz Valley Area Plan in that the proposal does not increase residential density or change allowed uses. The proposal does not authorize new development; rather, the proposal will only apply to reconstruction of previously existing single family homes.

c. The proposed text amendments and implementing ordinance are consistent with the Sonoma Mountain Area Plan because the proposal implements the state Alquist-Priolo Earthquake Fault Zoning Act. No new land development is proposed or authorized, and the rebuilt homes will have reduced earthquake vulnerability as compared to the previous construction due to required compliance with current building codes.

Be It Further Resolved that based on the above findings and all the information in the record, the Board of Supervisors does hereby amend the Public Safety Element of General Plan 2020 to add new Policy PS-1p, to read as follows:

> **Policy PS-1p:** Notwithstanding the foregoing, Policies PS-1f and PS-1g shall not apply to an application to reconstruct a single-family dwelling located in the Geologic Hazard Area Combining District that was destroyed in the October 2017 Sonoma Complex Fires, provided that the dwelling would comply with and qualify for an exemption under the state Alquist-Priolo Earthquake Fault Zoning Act (Public Resources Code, sec. 2621 et seq.), and provided further that the application complies with all applicable requirements of that certain ordinance adopted by the Board of Supervisors on December 11, 2018 and relating to reconstruction of single-family homes in the Geologic Hazard Area Combining District. This policy shall not be interpreted to apply to any project other than reconstruction of a single-family home destroyed in the 2017 Sonoma Complex Fires that is proposed to be rebuilt on the same lot.

Be It Further Resolved that if any section, subsection, sentence, clause, or phrase of this Resolution is for any reason held to be unconstitutional or invalid, such decision shall not affect the validity of the remaining portion of this Resolution. The Board of Supervisors hereby declares that it would have passed this Resolution and every section, subsection, sentence, clause or phrase thereof irrespective of the fact that any one or more sections, subsections, sentences, clauses or phrases be declared unconstitutional or invalid.

Be It Further Resolved that the Board of Supervisors designates the Clerk of the Board as the custodian of the documents and other material which constitute the record of proceedings upon which the decision herein is based. These documents may be found at the office of the Clerk of the Board, 575 Administration Drive, Room 100-A, Santa Rosa, California 95403.

ORDINANCE NO. (   )

AN UNCODIFIED ORDINANCE OF THE BOARD OF SUPERVISORS OF THE COUNTY OF SONOMA, STATE OF CALIFORNIA REGARDING RECONSTRUCTION OF SINGLE-FAMILY DWELLINGS DESTROYED IN THE 2017 SONOMA COMPLEX FIRES AND LOCATED IN THE GEOLOGIC HAZARD AREA COMBINING DISTRICT

The Board of Supervisors of the County of Sonoma, State of California, ordains as follows:

Section I. Findings. The Board hereby incorporates by reference the findings set forth in Paragraphs 1-3, inclusive, of Resolution No. 18-_______, adopted by the Board of Supervisors immediately prior to this Ordinance on December 11, 2018.

Section II. Reconstruction of Single-Family Dwellings Destroyed in October 2017 Sonoma Complex Fires.

A. Purpose.

1. This Ordinance specifies that, with respect to the 'G' Geologic Hazard Area Combining District, the geologic report and fault setback requirements that apply to new development projects do not apply to the reconstruction of single-family homes that were destroyed in the October 2017 fires in Sonoma County.

B. Definitions.

1. Fire-destroyed dwelling. A single-family dwelling that was located on a lot in the 'G' Geologic Hazard Area Combining District and was destroyed in the October 2017 Sonoma Complex Fires.

2. Geologic Hazard Area. The term Geologic Hazard Area shall mean the 'G' Geologic Hazard Area Combining District, as provided in Sonoma County Code Chapter 26, Article 70, the stated purpose of which is to reduce unnecessary exposure of people and property to risks of damage or injury from earthquakes, landslides and other geologic hazards in state-designated Alquist-Priolo Earthquake Fault Zones

3. Geologic Report. For purposes of this ordinance, the term "geologic report" shall refer to a fault study prepared or required pursuant to General Plan Policy PS-1f and Sonoma County Code § 26.70.030.

4. Single-family dwelling. For purposes of this ordinance only, the term "single-family dwelling" shall have the same meaning as set forth in state Public Resources Code, section 2621.6, subsections (a)(2)(A)-(B) and (b).

C. Notwithstanding any contrary provision of the Sonoma County Code, a geologic report shall not be required prior to reconstruction of a single-family dwelling located in the Geologic Hazard Area that was destroyed in the October 2017 Sonoma Complex Fires, provided that all requirements of Section III.D of this ordinance are met.

D. Notwithstanding any contrary provision of the Sonoma County Code, no setback from active faults or the surface trace thereof shall be required to rebuild a single-family dwelling that was located in the Geologic Hazard Area and destroyed in the October 2017 Sonoma Complex Fires, provided that all requirements of Section III.E of this ordinance are met.

E. Building permits for reconstruction of a fire-destroyed dwelling may proceed under this ordinance only after all property owners, including holders of security interests, sign a statement acknowledging that the property is located in a state-designated earthquake fault zone and accepting the associated risks and responsibilities of rebuilding thereon without benefit of a geologic report. The recorded statement shall be in a form to be approved by County Counsel and shall include a statement in substantially the following form: "The undersigned owners hereby acknowledge the potential geologic hazard, accept all risks associated with geologic hazards including any unidentified hazards, and agree to indemnify, defend, and hold harmless the County of Sonoma and its officers, agents and employees from any claim, liability, loss, injury or damage arising out of, or in connection with, any development activity or geologic hazards related to this property. This acknowledgment runs with the land and is binding on the undersigned and all of their successors, heirs and assigns."

Section III. No Mandatory Duty of Care. This ordinance is not intended to and shall not be construed or given effect in a manner that imposes upon the County or upon any officer or employee thereof a mandatory duty of care toward persons and property, so as to provide a basis of civil liability for damages, except as otherwise imposed by law.

Section IV. Preemption. This ordinance shall not be interpreted in any manner that conflicts with the laws or constitutions of the State of California.

Section V. If any section, subsection, sentence, clause, or phrase of this Ordinance is for any reason held to be unconstitutional or invalid, such decision shall not affect the validity of the remaining portion of this Ordinance. The Board of Supervisors hereby declares that it would have passed this Ordinance and every section, subsection, sentence, clause or phrase thereof irrespective of the fact that any one or more sections, subsections, sentences, clauses or phrases be declared unconstitutional or invalid.

Section VI. Effective Date. This Ordinance shall be and the same is hereby declared to be in full force and effect from and after thirty (30) days after the date of its passage and shall be published once before the expiration of fifteen (15) days after said passage, with the names of the Supervisors voting for or against the same, in *The Press Democrat*, a newspaper of general circulation published in the County of Sonoma, State of California.

In regular session of the Board of Supervisors of the County of Sonoma, adopted this 11th day of December, 2018, on regular roll call of the members of said Board by the following vote:

SUPERVISORS:

Gorin: ___ Rabbitt: ____ Zane: ____ Hopkins: ____ Gore:___

SUMMARY

Applicant:	County of Sonoma
Owner:	Various
Location:	Various parcels in G, Geologic Hazard Area combining district and within Sonoma Complex Fires 2017 perimeter; see attached maps
APNs:	See Table
Supervisorial District No.:	First and Fourth
Subject:	Geologic Hazard Area Requirements for Rebuilds of Homes Destroyed in the 2017 Sonoma Complex Fires
PROPOSAL:	General Plan Public Safety Element text amendment and ordinance specifying that within the Geologic Hazard Area Combining District, the geologic report and fault setback requirements applicable to new development do not apply to reconstruction of single-family homes that were destroyed in the 2017 Sonoma Complex Fires.
Environmental Determination:	The proposal is within the scope of the Sonoma County General Plan 2020 Final EIR (Final EIR) which adequately describes the activity for purposes of CEQA. Accordingly, under CEQA Guidelines §§ 15168 and 15162, no additional environmental review is required.
General Plan:	Various

Attachment C

Specific/Area Plan: Bennett Valley Area Plan (partial), Franz Valley Area Plan (partial) Sonoma Mountain Area Plan (partial)

Land Use: Various

Ord. Reference: General Plan Public Safety Element Policies PS-1e, PS-1f, PS-1g, and Sonoma County Code Chapter 26, Article 70 (Geologic Hazard Area Combining District)

Zoning: Geologic Hazard Area Combining District; various base districts

RECOMMENDATION:
Adopt a resolution making the following recommendations to the Board of Supervisors:

A. Find that the proposed general plan amendment and ordinance are within the scope of the previously certified Final EIR for Sonoma County General Plan 2020 and that the Final EIR adequately describes the activity for purposes of the California Environmental Quality Act (CEQA). Accordingly, pursuant to CEQA Guidelines §§ 15168 and 15162, no additional environmental review is required;

B. Adopt the proposed amendment to add policy PS- 1P the Public Safety Element of General Plan 2020; and

C. Adopt the proposed ordinance exempting preexisting single family homes destroyed by the 2017 fires from the geologic report and fault setback requirements in the Geologic Hazard Area combining district.

EXECUTIVE SUMMARY:

In response to Board direction Staff is advancing limited amendments to the Public Safety Element of Sonoma County General Plan and to county ordinance to reduce the geologic report and fault setback requirements for reconstruction of single-family homes destroyed in the October 2017 fires.

The proposed amendments would apply only to parcels in the, G, Geologic Hazard Area Combining District (Geologic Hazard Zone), that were affected by the Sonoma Complex Fires 2017. The amendments would be limited to reconstruction of one and two story single-family homes of wood or steel frame construction. The proposal would not apply to multi-family structures, structures greater than two stories, commercial structures, structures outside of the Sonoma Complex Fire 2017 perimeter, or new development on previously undeveloped sites. The proposal is fully compliant with the state Alquist-Priolo Earthquake Fault Zoning Act, which exempts most single-family homes up to two stories. Homes being rebuilt under the proposal will still be required to comply with all other current codes, including seismic safety standards.

BACKGROUND:
The October 2017 fires destroyed more than two thousand residences in unincorporated Sonoma County. Approximately 55 of the homes destroyed were within the Geologic Hazard Zone, primarily located in the low density residential communities of Mark West Springs, Larkfield, and Wikiup. Because the Sonoma County General Plan and County Code do not distinguish between what is truly new development versus reconstruction of prior development a geologic report is currently required prior to construction in the Geologic Hazard Zone. The intent of the proposed General Plan amendment and ordinance is to reduce the additional studies and expenses faced by property owners trying to rebuild fire destroyed homes.

Under the currently applicable rules property owners impacted by the October 2017 fires face additional, expensive obstacles to rebuilding their homes. To assist homeowners affected by the fires, the Board of Supervisors approved a minute order (Resolution No. 18-0390) directing Permit Sonoma to bring forward proposed amendments to the general plan and county code to clarify that single family homes located in the Geologic Hazard Zone and destroyed in the Sonoma Complex Fires may be rebuilt on the same parcel without meeting geologic report or fault setback requirements. The attached maps show the location of the Geologic Hazard Zone in Sonoma County and the extent of the fire perimeter.

The geologic report otherwise required under the General Plan Public Safety Element and Article 70 of the Sonoma County Zoning Ordinance is a fault study which entails deep trenching across each property, perpendicular to the suspected fault, to determine whether there is a surface trace of an active fault on the site. Development is prohibited within 50 feet of the surface trace of an active fault, and as a result homeowners whose reports identified a surface fault would either not be able to rebuild their homes on the same site or without additional siting constraints. The trenching and geologic report costs each property owner additional months of delay in the rebuilding process and approximately $15,000, which is unaffordable to many homeowners who find themselves substantially underinsured. The proposed general plan amendment and ordinance would allow the approximately 55 property owners who lost homes in the Geologic Hazard Zone to rebuild their homes without incurring the significant additional delay and expense of trenching and preparation of a geologic report.

The homes within the Geologic Hazard Zone that were destroyed in the October 2017 fires are concentrated in the Mark West Springs and Larkfield/Wikiup areas. Many of these homes were built before the County’s Geologic Hazard Zone requirements were adopted in 1974 as part of the 1989 General Plan. These homes predated the current requirements and were built without geologic studies or fault setback requirements. A limited number of affected homes in the Geologic Hazard Zone were built later and already have geologic reports on file from their initial construction. The Geologic Hazard Zone was designated and its accompanying regulations were developed and applied as part of the implementation of the 1989 General Plan, and in 1993 the policies were carried forward into General Plan 2020.

The geographic area that is identified as the Geologic Hazard Zone was designated by the State Geologist pursuant to the state Alquist-Priolo Earthquake Fault Zone Act (Alquist-Priolo Act), formerly the Alquist Priolo Special Studies Zone Act, which provides the minimum regulatory requirements for most development in proximity to a known trace fault. The Alquist-Priolo Act was initially enacted by the State in 1971, following the San Fernando earthquake. It established the basis for the County's policy of requiring a geologic report and trace fault setbacks for development along known faults.

Wood and steel frame single family residential development of up to two stories are exempt from the Alquist-Priolo Act. However, the Alquist-Priolo Act permits local governments' regulations to be more stringent. Many local jurisdictions, including Sonoma County, developed implementing policies stricter than the Act requires; as such, the County Code and General Plan do not include the exception to the geologic report and trace fault setbacks for single family homes.

As part of today's proposal the General Plan and County Code would be amended to clarify that for the sole purposes of rebuilding single family homes lost to the October 2017 fires, the applicable General Plan Public Safety Element policies and County Code requirements for geologic reports and fault trace setbacks do not apply. However, rebuild projects would be required to comply with current building codes, seismic safety standards, and state law, including the Alquist-Priolo Act. Property owners wishing to rebuild without geologic reports would also be required to sign a document acknowledging and accepting the risk of rebuilding in that location. The document would be recorded to provide notice to future potential buyers.

PROJECT DESCRIPTION:

The County is proposing to amend the Sonoma County General Plan and adopt an uncodified ordinance to allow fire-destroyed homes in the Geologic Hazard Zone to be rebuilt without the otherwise required geologic study and trace fault setback. The proposed exception for fire rebuilds will not apply to development other than rebuilds on the same site of homes lost in the October 2017 fires. Specifically, the proposed exception will not apply to commercial structures, structures outside of the Sonoma Complex Fires perimeter, or development on previously undeveloped sites.

DISCUSSION:

Seismic Safety:
Allowing rebuilding of destroyed homes without a geologic report does not increase the exposure of persons to earthquake hazards over pre-existing conditions. The homes that would be rebuilt under this legislation existed in the same location before the fires and will be rebuilt with improved design and technology, reflecting significantly increased seismic safety standards when compared with their original construction. Because the California building code seismic standards have been regularly amended and improved since most of the affected Geologic Hazard Zone homes were built, the rebuilt homes will have reduced earthquake vulnerability as compared to the previous construction. As noted above, the proposed legislation will not apply to any other projects.

General Plan Consistency:
The General Plan 2020 policies related to the proposed project are shown below including the proposed new policy, **Policy PS 1-P**.

> ***Policy PS-1e:*** *Continue to implement the "Geologic Hazard Area" combining district which establishes regulations for permissible types of uses and their intensities and appropriate development standards.**
>
> ***Policy PS-1f:*** *Require and review geologic reports prior to decisions on any project which would subject property or persons to significant risks from the geologic hazards areas shown on Public Safety Element hazard maps and related file maps and source documents. Geologic reports shall describe the hazards and include mitigation measures to reduce risks to acceptable levels. Where appropriate, require an engineer's or geologist's certification that risks have been mitigated to an acceptable level and, if indicated, obtain indemnification or insurance from the engineer, geologist, or developer to minimize County exposure to liability.**
>
> ***Policy PS-1g****: Prohibit structures intended for human occupancy (or defined as a "project" in the Alquist-Priolo Special Studies Zones Act and related Administrative Code provisions) within 50 feet of the surface trace of any fault.**
>
> ***Policy PS-1p****: Notwithstanding the foregoing, Policies PS-1f and PS-1g shall not apply to an application to reconstruct a single-family dwelling located in the Geologic Hazard Area Combining District that was destroyed in the October 2017 Sonoma Complex Fires, provided that the dwelling would qualify for an exemption under the state Alquist-Priolo Earthquake Fault Zoning Act (Public Resources section 2621 et seq.) and provided further that the application complies with all applicable requirements of Ordinance No. ______________. This policy shall not be interpreted to apply to any project other than*

> *reconstruction of a home destroyed in the 2017 Sonoma Complex Fires and proposed to be rebuilt on the same lot.*

The proposed General Plan and ordinance amendments are very limited in scope, and apply to rebuilds of homes that existed when the General Plan was adopted. Accordingly, the proposed legislation is consistent with the General Plan as amended by the above text. As proposed Policy PS 1-P will only apply to rebuilding of previously existing homes destroyed by the October 2017 fires. This policy will exempt rebuilding of preexisting homes destroyed by the Sonoma Complex Fires but will not apply to other development.

The homes to be rebuilt under the proposed conditions generally predated the Geologic Hazard Zone and requirement for a geologic report and their reconstruction does not interfere with the continued implementation of the above policy and Geologic Hazard Area Combining District for new uses. The proposed ordinance requires the property owner to sign an indemnification and acknowledgement of risk acknowledging that the home is within the Geologic Hazard Zone and accepting the risk of rebuilding without the benefit of a geologic report.

Area Plan Consistency:
Some of the parcels that are designated with the Geologic Hazzard Area Combining District and impacted by the October 2017 Fires are within the boundaries of the Bennett Valley Area Plan, Franz Valley Area Plan, or Sonoma Mountain Area Plan. The Area Plans do not include the Mark West or Larkfield/Wikiup communities where most of the parcels impacted by this proposal are concentrated. The previously applicable Larkfield Area Plan was repealed in 2008. The proposed project is consistent with each of the area plans. Applicable policy from each Area Plan is below.

Bennet Valley Area Plan:
Residential development shall occur in the least constrained, most suitable areas.

> *Parcels within the Alquist-Priolo Zone or in geologically unstable areas shall be developed only at very low densities. Siting and foundation design of all structures in these areas shall comply with the General Plan Public Safety Element.*

The proposed project does not increase residential density or change allowed uses. The siting requirements are consistent with the General Plan Public Safety Element as amended by this proposal. Additionally, the concentration of properties where the exemption will be applied is outside of the Bennett Valley Area Plan.

Franz Valley Area Plan:
Limit or prevent residential development in areas of high or extreme fire, geologic, and seismic hazards.

The proposed project does not increase residential density or change allowed uses. The proposed project does not include new development, rather it will only be applied for the reconstruction of previously existing residential structures. Additionally, the concentration of properties where the exemption will be applied is outside of the Franz Valley Area Plan.

Sonoma Mountain Area Plan:
Geologic Hazards

> *(1) Continue to implement the Alquist-Priolo Special Studies Zones Act of 1972.*
> *(2) Require an engineering geologist's report whenever there is an unacceptable level of risk of geologic hazard associated with a proposed land development.*

The proposed project is consistent with provision of the Alquist-Priolo Act that exempts single family residential development of wood or steel frame construction from the report and fault setback requirements. Because the proposed exception will be made only for previously developed residential structures no new land development is proposed, further the rebuilt homes will have reduced earthquake vulnerability as compared to the previous construction. No new risk to seismic hazards is proposed. Additionally, the concentration of properties where the exemption will be applied is outside of the Sonoma Mountain Area Plan.

Zoning Consistency:
The project is consistent with Zoning Code and implements the General Plan as amended by this proposal. The uncodified ordinance would not amend the text of the Sonoma County Zoning Code and is consistent with the purpose of Article 70, the Geologic Hazard Area Combining District in that it does not increase risk due to earthquake hazards because it will only allow for the rebuilding of previously existing homes without a geologic report or fault setback requirements.

Environmental Determination:
The proposal is within the scope of the Sonoma County General Plan 2020 Final EIR (Final EIR) and the Final EIR adequately describes the activity for purposes of CEQA. The proposal does not involve new development or an increase in density over what is assumed in the General Plan and Final EIR, because the homes to be rebuilt existed when the General Plan was adopted. The homes that could be rebuilt without geologic reports pursuant to this proposal are not “new” development—they are replacements of previously existing single-family homes with like structures—and the analysis in the Final EIR focused on the mitigating effect of Geologic Hazard Zone regulations on new development only. Accordingly, under CEQA Guidelines §§ 15168 and 15162, no additional environmental review is required. In any event, the proposal does not itself approve any development; it merely clarifies the regulations applicable to home rebuilds in the Geologic Hazard Zone. In the alternative, the project is exempt from CEQA pursuant to the general rule of CEQA Guidelines section 15061(b)(3), which applies when it can be seen with certainty to have no possibility for causing a significant effect on the environment.

FINDINGS:

1. General Plan Consistency

This project is substantially consistent with the General Plan as amended as of the effective date of the Board of Supervisors Ordinance.

The homes to be rebuilt under the proposed conditions generally predated the Geologic Hazard Zone and requirement for a geologic report and their reconstruction does not interfere with the continued implementation of the General Plan Public Safety Element.

Consistent with PS Policy 1-f the proposed ordinance requires the property owner to sign an indemnity and acknowledgement of risk acknowledging that the home is within the Geologic Hazard Zone and accepting the risk of rebuilding without the benefit of a geologic report.

2. Area Plan Consistency

The proposed project is consistent with the Bennett Valley Area Plan in that it does not increase residential density or change allowed uses. The siting requirements are consistent with the General Plan Public Safety Element as amended by this proposal.

The proposed project is consistent with the Franz Valley Area Plan in that it does not increase residential density or change allowed uses. The proposed project does not include new development, rather it will only be applied for the reconstruction of previously existing residential structures.

The proposed is consistent with the Sonoma Mountain Area Plan because the project implements the Alquist-Priolo Act. No new land development is proposed, and the rebuilt homes will have reduced earthquake vulnerability as compared to the previous construction. No new risk to seismic hazards is proposed.

3. Zoning Consistency

The project implements the general plan as amended by this proposal as of the effective date of the Board of Supervisors Ordinance.

The uncodified ordinance would not amend the text of the Sonoma County Zoning Code.

4. CEQA

The proposal is within the scope of the Sonoma County General Plan 2020 Final EIR (Final EIR) and the Final EIR adequately describes the activity for purposes of CEQA. Pursuant to CEQA Guidelines §§ 15168 and 15162, no additional environmental review is required. In the alternative, the project is exempt from CEQA pursuant to the general rule of CEQA Guidelines section 15061(b)(3), which applies when it can be seen with certainty to have no possibility for causing a significant effect on the environment.

Resolution Number 18-020

County of Sonoma
Santa Rosa, California

November 15, 2018
PLP18-0040 Cecily Condon

RESOLUTION OF THE PLANNING COMMISSION, COUNTY OF SONOMA, STATE OF CALIFORNIA, RECOMMENDING THE BOARD OF SUPERVISORS FIND THE PROJECT TO BE WITHIN THE SCOPE OF THE SONOMA COUNTY GENERAL PLAN 2020 FINAL EIR AND APPROVE THE GENERAL PLAN AMENDMENT AND UNCODIFIED ORDINANCE FOR VARIOUS PARCELS IN 'G' GEOLOGIC HAZARD AREA COMBINING DISTRICT AND WITHIN THE PERIMETER OF THE OCTOBER 2017 FIRES

WHEREAS, the Sonoma County Board of Supervisors Adopted a Minute Order Resolution No. 18-0390 directing Staff with the Sonoma County Permit and Resource Management Department to bring forward draft amendments to the General Plan Public Safety Element and Chapter 26, Article 70 of the County Code to specify that single family homes located in the G, Geologic Hazard Area Combining District and destroyed in the Sonoma Complex Fires may be rebuilt on the same parcel without geologic reports(the Project); and

WHEREAS, the Permit Resource and Management Department (PRMD) determined that the Project is within the scope of the Sonoma County General Plan 2020 Final EIR (Final EIR) and the Final EIR adequately describes the activity for purposes of CEQA,; and

WHEREAS, in accordance with applicable provisions of law, the Planning Commission held a public hearing on November 15, 2018, at which time the Planning Commission heard and received all relevant testimony and evidence presented orally or in writing regarding the Project. All interested persons were given an opportunity to hear and be heard regarding the Project; and

WHEREAS, the Planning Commission has had an opportunity to review this Resolution and finds that it accurately sets forth the intentions of the Commission regarding the Project.

NOW, THEREFORE, BE IT RESOLVED that the Planning Commission makes the following findings:

1. CEQA

   The proposal is within the scope of the Sonoma County General Plan 2020 Final EIR (Final EIR) and the Final EIR adequately describes the activity for purposes of CEQA. Pursuant to CEQA Guidelines §§ 15168 and 15162, no additional environmental review is required. In the alternative, the project is exempt from CEQA pursuant to the general rule of CEQA Guidelines section 15061(b)(3), which applies when it can be seen with certainty to have no possibility for causing a significant effect on the environment.

2. General Plan Consistency

   This project is substantially consistent with the General Plan as amended as of the effective date of the Board of Supervisors Ordinance.

The homes to be rebuilt under the proposed conditions generally predated the Geologic Hazard Area and requirement for a geologic report and their reconstruction does not interfere with the continued implementation of the General Plan Public Safety Element.

Consistent with PS Policy 1-f the proposed ordinance requires the property owner to sign an indemnity and acknowledgement of risk acknowledging that the home is within the Geologic Hazard Area and accepting the risk of rebuilding without the benefit of a geologic report.

3. Area Plan Consistency

The proposed project is consistent with the Bennett Valley Area Plan in that it does not increase residential density or change allowed uses. The siting requirements are consistent with the General Plan Public Safety Element as amended by this proposal.

The proposed project is consistent with the Franz Valley Area Plan in that it does not increase residential density or change allowed uses. The proposed project does not include new development, rather it will only be applied for the reconstruction of previously existing residential structures.

The proposed is consistent with the Sonoma Mountain Area Plan because the project implements the Alquist-Priolo Act. No new land development is proposed, and the rebuilt homes will have reduced earthquake vulnerability as compared to the previous construction. No new risk to seismic hazards is proposed.

4. Zoning Consistency

The project is consistent with the Sonoma County Code as amended and implements the general plan as amended by this proposal as of the effective date of the ordinance.

BE IT FURTHER RESOLVED that the Planning Commission recommends that the Board of Supervisors find the Project is within the scope of the Final EIR Final EIR and that the Final EIR adequately describes the activity for purposes of CEQA, and approve the requested General Plan Amendment, and Uncodified Ordinance.

BE IT FURTHER RESOLVED that the Planning Commission designates the Secretary of the Planning Commission as the custodian of the documents and other material which constitute the record of proceedings upon which the decision herein is based. These documents may be found at the office of the Sonoma County Permit and Resource Management Department, 2550 Ventura Avenue, Santa Rosa, CA 95403.

THE FOREGOING RESOLUTION was introduced by Commissioner Fogg, who moved its adoption, seconded by Commissioner Tamura, and adopted on roll call by the following vote:

Commissioner Fogg	Aye
Commissioner Tamura	Aye
Commissioner Cook	Absent
Commissioner Kelley	Aye
Commissioner Lowry	Aye

Ayes: 4 Noes: 0 Absent: 1 Abstain: 0

WHEREUPON, the Chair declared the above and foregoing Resolution duly adopted; and

SO ORDERED.
